APPENDIX C

AIRBORNE GEOPHYSICAL SURVEY SUMMARY

Appendix C

Airborne Geophysical Survey Summary

C.1 Introduction

A low-altitude helicopter geophysical survey was performed over a 2,562 hectare (6,332 acre) portion of the historical Impact Area. The survey did not include the far eastern portion of the historical Impact Area due to the steep terrain. The survey objective was to assess the effectiveness of using airborne geophysical surveying to detect and map surface and buried “UXO”. A secondary objective was to identify soil resistivity variations that “might be associated with contaminants.” Overall, the work comprised a main survey in the Impact Area and a supplemental survey of another site known as the MRS-16 area (Figure C-1). Additionally, calibration

surveying was performed at a special Fort Ord test site where inert UXO items and UXO simulants were intentionally buried at known locations as part of the 2001 Ordnance Detection and Discrimination Study (ODDS).

The geophysical survey was performed jointly by Battelle and Oak Ridge National Laboratory (ORNL) between January 29 and February 17, 2005. The geophysical methods used were magnetics and time-domain electromagnetics (TEM). Magnetic surveying was performed over the entire 2,562-hectare (ha) main survey area, while TEM surveying was performed within the main survey area at two smaller areas totaling 72 ha (178 acres) in size (Figure C-1).

C.2 Survey Parameters and Procedures

The geophysical instruments were deployed using the Oak Ridge Airborne Geophysical System (ORAGS) mounted on a Bell 206 Long Ranger helicopter. ORAGS magnetic survey system housed four magnetometers at 1.7-meter spacings in a boom forward of the helicopter and two additional magnetometers in lateral booms on each side of the helicopter for a total of 8 magnetometers. The TEM system comprised a 12- by 3-meter transmitter coil and a pair of 2.7- by 2.7-meter receiver coils inside rigid carbon fiber and Kevlar booms mounted to the underside of the helicopter (Figure C-2). The magnetometer system was used to detect metal objects, while the TEM system was used to both detect metal objects and assess soil resistivity.

Figure C-2 – ORAGS System

The 12-meter wide magnetometer array was flown at 25-meter line spacing, which provided approximately 50 percent coverage of the 2,562 hectares (6,332 acres) surveyed. The 10-meter wide TEM array was flown with an interleaved line spacing of 5 meters, which provided 100 percent coverage across the relatively small area (72 ha or 178 acre) surveyed using TEM. Aircraft ground speed was maintained at 10 to 15 meters/second (20-35 miles per hour [mph]). Magnetic data were processed to a 120-Hz recording rate, which equates to a down-line sample density of approximately 15 cm at typical survey speeds. TEM data were processed to a 30-Hz sample rate, which equates to a down-line sample density of approximately 60 cm.

Aircraft height was measured using a laser altimeter and ranged from 2 meters to over 6 meters above ground surface, with the median height in the main survey block being 3.5 meters. Additionally, aircraft height was monitored using four GPS antennas incorporated into ORAGS.

The GPS and laser altimeter data were combined to produce a digital elevation map (DEM)

which was used to assess elevation changes beneath the array swath and calculate the height at each of the eight magnetic sensor locations. For the main survey, aircraft height varied according to topography and vegetative cover. For the calibration surveying the test sites were surveyed at three nominal heights — 2m, 4m, and 5.5m — to better assess the detection capabilities of the magnetic system. The calibration surveying demonstrated the critical dependence of aircraft height on the ability of airborne magnetics to detect potential UXO items.

C.3 Data Processing and Analysis

The raw magnetic data were processed in several stages to produce a Total Magnetic Field Intensity (Total Field) data set. The processing stages included corrections for sensor time lags, removal of sensor dropouts, compensation for dynamic helicopter effects, removal of diurnal variation, correction for sensor heading error, array balancing, and removal of helicopter rotor noise. The Total Field data were interpolated onto a regular grid at 0.5 meter intervals using GEOSOFT Oasis Montaj geophysical data processing software. Next, vertical magnetic gradient and analytic signal data grid maps were prepared from the Total Field data grid.

TEM data processing included corrections for sensor time lags, removal of aircraft rotor and blade noise using a frequency filter, and “EM response leveling” to correct for instrument drift or (data) offsets between adjacent flight lines. EM response leveling entailed estimating and then subtracting the background response along each survey line. GEOSOFT was then used to prepare maps showing the EM response in millivolts.

The bulk of the interpretation was performed using the magnetic analytic signal map. The analytic signal map was used for interpretation because, for small-object targets like UXO items, the analytic signal produces a single positive peak at a metal object location. The single peak provides a better indication of the object’s true location and size than the magnetic anomalies exhibited by total field or vertical gradient data. As a further processing step, the analytic signal

data were masked according to aircraft altitude to produce separate maps showing only the data collected from 2 meters and lower, from 4 meters and lower, and from 5.5 meters and lower. This step was performed to assess the extent of data coverage for each survey height.

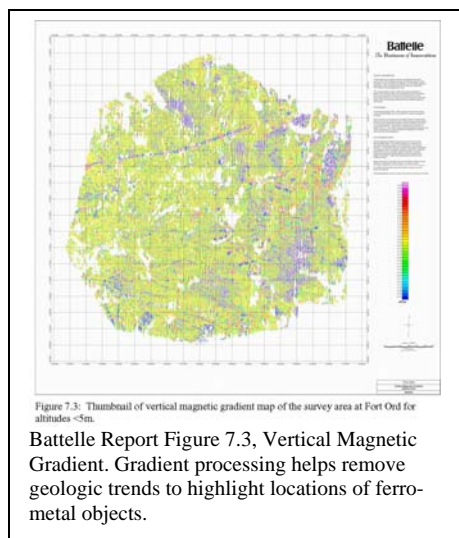

C.4 Results

Magnetic Survey

The magnetic survey results are shown on Battelle Figures 7.1, 7.3, and 7.5, which present Total Field, Vertical Gradient, and Analytic Signal maps, respectively. Additionally, Battelle prepared an “Interpretation Map” (Battelle Figure 7.8) to organize and describe the features exhibited on the magnetic data maps. Finally, Battelle prepared an “Anomaly

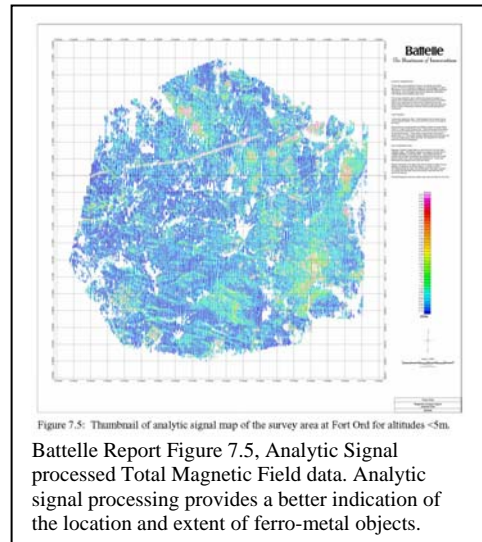

Density Map” (Battelle Figure 7.9) which “attempts to represent a count of debris pieces.” The Anomaly Density Map was used to compare the number of airborne magnetic anomalies with the number of ground magnetic anomalies for the same area.

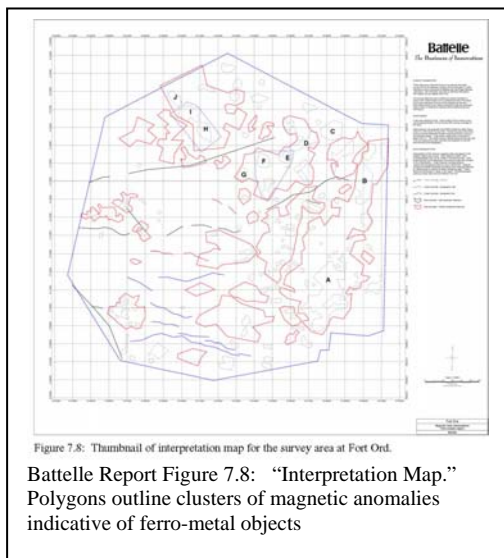

Additionally, MACTEC prepared Plate 13, which presents Battelle’s Analytic Signal data on a basemap showing the historical range fans and the locations found ordnance items. Accordingly, Figure Plate 13 facilitates an assessment of the airborne magnetic survey results with respect to known ground features. For convenience, thumbnail versions of the Battelle figures

are presented on these pages; however, the Battelle report and the accompanying full-sized figures should be consulted if a more detailed examination of the survey results is wanted.

As seen on the analytic signal map (Battelle Figure 7.5), the magnetic data exhibit various linear response features that can be readily attributed to roads, tracks, fences, and pipelines. Additionally, the magnetic data show other linear features that correspond to topographic ridges and troughs and therefore may be geologic in origin. In addition to linear trends, Battelle identified anomaly peaks and grouped them by

amplitude into contiguous anomaly “blocks” where possible. The high-amplitude anomaly blocks are shown as grey polygons on the Interpretation Map (Battelle Figure 7.8). According to Battelle, the polygons “should not be taken as physical target boundaries. They are merely an attempt to outline the highest amplitude responses.” Battelle further states: “in many cases,

dozens or hundreds of individual items may be combining to create a single anomaly that effectively saturates the systems ability to resolve them.”

Battelle has also delineated medium-amplitude blocks that “may be associated with lesser densities of debris (however) the true source ...cannot be ascertained without ground follow-up.” Battelle labeled 10 high-amplitude anomaly blocks as A

through J, further stating that Blocks H-J correspond to “known ranges under remediation.”

Battelle also states that most of the high-amplitude blocks are contained within a larger medium-

amplitude block and suggests this may represent “scattered debris around a central cluster.” Further, Battelle states high-amplitude blocks lacking surrounding a medium-amplitude “halo” may represent a single large object. To explain the absence of a medium-amplitude halo around some of the high-amplitude blocks, Battelle states “much of the ordnance expected at this site is below the detection threshold of an airborne magnetometer system.” In other words, the metal debris may very well be present but it cannot be detected by the ORAGS.

The “Airborne Anomaly Density Map” (Battelle Figure 7.9), displays the number of anomaly peaks in units of counts per hectare. Anomaly peaks were defined by Battelle as those analytic signal peaks exhibiting an amplitude at least 2.5 times background measurements. The density of airborne

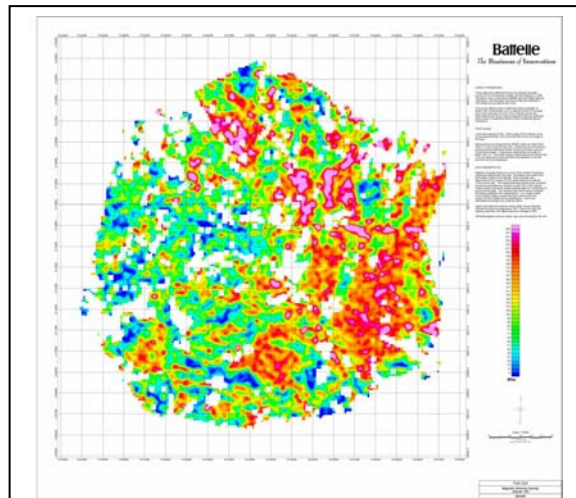

Figure 7.9: Thumbnail of anomaly density map of the survey area at Fort Ord.

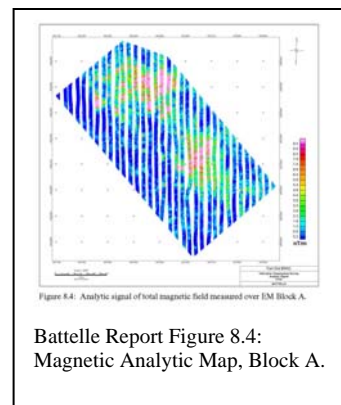

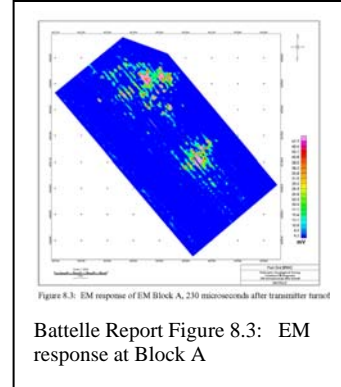

Battelle Report Figure 7.9: Anomaly Density Map, which shows a count of the number of anomaly peaks per hectare. Counts range from zero (blue areas) to a high of over 300 (pink areas).

anomalies was compared to ground magnetic anomaly density figures for the same areas as provided by Parsons Engineering through the Corps of Engineers. The ratio of ground anomalies to air anomalies ranged from 2:1 to 9:1. Battelle notes that the Airborne Anomaly Density Map shows a strong correlation with the medium-amplitude polygon “blocks” on Figure 7.8. Battelle also notes that the dominant feature of the Airborne Anomaly Density Map is the very high anomaly density found in the vicinity of Range 43 and 48.

Electromagnetic Survey

ORAGS-TEM data were collected in two areas designated Block A (35 ha/86 acres) and Block B (37 ha/92 acres). Battelle figures 8.3 through 8.6 show maps of TEM and magnetic data obtained over the same areas. In general, the TEM anomaly locations correspond to magnetic anomaly

locations, however the TEM anomalies are more localized, i.e., smaller in extent. Battelle states that the “analytic signal appears more sensitive to smaller items than does the EM system...Ordnance concentrations can be well-located using the Fort Ord EM data (however) it is the small individual ordnance items that are difficult for EM to define...” Battelle further states “the ORAGS-TEM system...shows even more height dependence than to the magnetic systems.” Additionally, the ORAGS-TEM exhibits more noise than the ORAGS-MAG system. The noise is evidenced by the corrugated or striped appearance of the EM data maps. Battelle attributes the noise to small changes in helicopter roll, which, given the 10 meter separation between the EM sensors, can cause enough difference in sensor height to result in a “100 percent difference in EM response between the port and starboard sensors.” Finally, the Fort Ord EM data exhibited a “variable period oscillation,” the source of which has not yet been ascertained. In some cases the oscillation is substantial—over 10 millivolts—and could hide small anomalies produced by individual ordnance items.

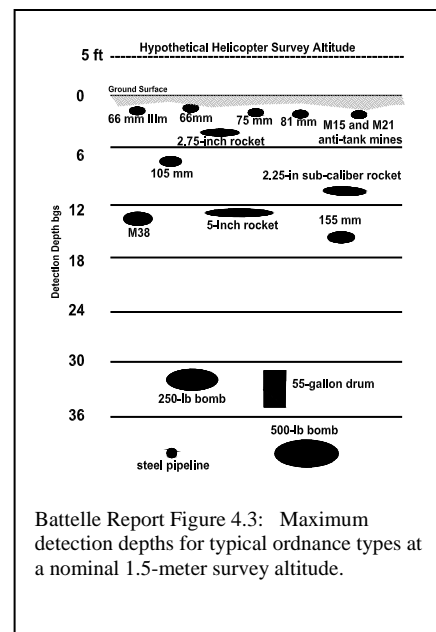

A secondary objective of the ORAGS-TEM survey was to identify soil resistivity variations that “might be associated with contaminants.” However, “neither of the EM survey blocks shows unambiguous responses from soil cover.” “The mean millivolt response at 2 meters height is virtually indistinguishable from the high altitude response.” Accordingly, Battelle concludes that it is not possible to use the ORAGS-TEM data for ground conductivity mapping.

C.5 Conclusions

The Battelle report states that the airborne survey data are “suitable for use...in a variety of characterization, screening-level, and removal actions associated with determination of the extent

of potential UXO-related contamination....” Additionally, the survey “was successful in delineating areas of greater and lesser ordnance contamination....” However, the report also states that “airborne data are NOT suitable for declaring an area free of contamination as some ordnance types fall below the detection threshold of the system and only a percentage of other ordnance types will be detected.” Battelle notes that flying the 12-meter wide magnetometer array at 25-meter line spacing meant that only half of the area of interest was surveyed; accordingly, the survey was not intended to detect all items within the survey area. Battelle also notes that airborne geophysical surveying at Fort Ord is complicated by rough topography and tall vegetation, which forced aircraft height above 5 meters in some areas. The increased survey height lowered the ORAGS system’s sensitivity in those areas and further reduced the overall survey coverage. Battelle also reports that the lack of a uniform survey height complicates the data analysis and further reduces the effectiveness of airborne surveying at Fort Ord. Despite the above limitations, Battelle concludes that “clusters of ordnance...represent a legitimate target for this technology...” because such clusters allow for “interpolation between (survey) lines and across gaps caused by increased flight height.”

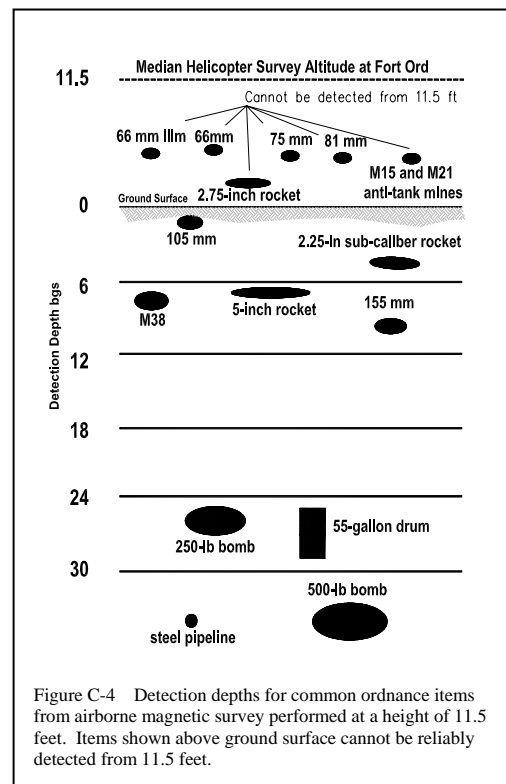

The calibration data obtained at the ODDS test site as part of the ORAGS survey indicate that targets larger than 90mm can be detected by magnetics with a high degree of certainty if they are surveyed at a low height of 2 meters; however, this low height was achieved only rarely during the Fort Ord survey (1 percent of the time). The median height of the main survey was 3.5 meters. Calibration test survey data from a height of 4 meters showed that only pipes, presumed clusters,

and the largest of the single targets are clearly visible, yet data from this altitude and lower comprise only 61 percent of the total survey block.

Battelle's report includes a figure (Battelle Figure 4.3) that shows "reliable detection depths for common ordnance types" when surveyed by magnetics from a height of 1.5 meters (5 feet). The figure shows that many common ordnance types can be detected to a depth of 6 feet below ground surface when surveyed from a height of 5 feet. However, the figure also shows that many of these same items, including 81mm projectiles, 2.75-rockets, M15 and M21 anti-tank mines, cannot be detected when surveyed from the median height of the Fort Ord survey (3.5 meters or 11.5 feet). Figure C-4 presents a version of Battelle Figure 4.3 that has been revised to reflect the median Fort Ord survey height. Items shown above the ground surface on Figure C-4 cannot be reliably detected from the median survey height of the Fort Ord Airborne survey.

Comparison of the Fort Ord ORAGS-TEM data with ORAGS-MAG data from the same area shows that the MAG system is more sensitive to metal objects than the TEM system and therefore is the preferred

system for airborne geophysical surveying at Fort Ord. However, the Fort Ord airborne magnetics survey's lack of sensitivity to many common ordnance items calls into question the usefulness of airborne geophysical surveying for ordnance detection and mapping at the Fort Ord Impact Area. The airborne survey's lack of sensitivity is demonstrated by the fact that ground magnetic surveys detected from two to nine times as many magnetic anomalies as did the ORAGS-MAG system. Battelle's report states, "It must be recognized that if the ODDS test grid

is indicative of the ordnance types and densities over the rest of the Fort Ord site, the airborne magnetometer system is not sufficiently sensitive to detect all discrete ordnance items that may be present.” It is MACTEC’s opinion that this would be the case even if a fully-interleaved, 100% coverage airborne magnetic survey were flown at Fort Ord.

RESPONSE TO COMMENTS
Draft Track 3 Impact Area Munitions Response
Area Munitions Response Remedial Investigation/Feasibility Study,
Former Fort Ord, August 8, 2006

United States Environmental Protection Agency, Region IX
COMMENTS

GENERAL COMMENTS

Comment 1: The Draft Track 3 Impact Area Munitions Response Area Remedial Investigation/Feasibility Study, Former Fort Ord, California, (hereinafter referred to as the Draft Track 3 IA RI/FS) contains numerous uses of the terms “MEC Specialist,” “Qualified MEC Personnel,” “Military Munitions Specialists,” and other similar terms without defining what exactly is intended by the use of these terms, or the qualifications of the personnel described by them. The Department of Defense has provided precise terminology for identifying personnel qualified as Explosive Ordnance Disposal Technicians and as Unexploded Ordnance (UXO) Technicians. These two categories of personnel are the only ones authorized to undertake the recovery and disposal of munitions and explosives of concern (MEC).

Their titles and necessary education and experience are outlined in the Department of Defense Explosives Safety Board Technical Paper (TP) 18 (Minimum Qualifications for Unexploded Ordnance [UXO]. Technicians and Personnel).

TP 18 defines the terms “Explosive Ordnance Disposal (EOD) Personnel,” “UXO Technician,” and “UXO-Qualified Personnel” as follows:

- **Explosive Ordnance Disposal (EOD) Personnel:** Military personnel who have graduated from the Naval School, Explosive Ordnance Disposal (NAVSCOLEOD); are assigned to a military unit with a Service-defined EOD mission; and meet Service and assigned unit requirements to perform EOD duties. EOD personnel have received specialized training to address explosive and certain Chemical Agent (CA) hazards during both peacetime and wartime. EOD personnel are trained and equipped to perform Render Safe Procedures (RSP) on nuclear, biological, chemical, and conventional munitions, and on improvised explosive devices.
- **UXO Technician:** Personnel who are qualified for and filling Department of Labor, Service Contract Act, and Directory of Operations contractor positions of UXO Technician I, UXO Technician II, and UXO Technician III.

- **UXO-Qualified Personnel: Personnel who have performed successfully in military EOD positions, or are qualified to perform in the following Department of Labor, Service Contract Act, Directory of Operations contractor positions: UXO Technician II, UXO Technician III, UXO Safety Officer, UXO Quality Control Specialist or senior UXO Supervisor.”**

It should be noted that UXO Technician 1 personnel are not considered as UXO qualified by TP 18. For this reason, they must always work under the supervision of a UXO Technician II or higher when accomplishing MEC related work. They are not allowed to serve as escorts in MEC contaminated areas.

As the terms “MEC Specialist,” “Qualified MEC Personnel,” and “Military Munitions Specialists” are used in the Draft Track 3 IA RI/FS without being defined, they should either be defined as to the qualifications expected of these positions, or they should be replaced with the official terms used by the Department of Defense. Any definition of these terms and functions performed by persons occupying these positions should comply with the requirements of TP 18. Please make this correction as necessary throughout the Draft Track 3 IA RI/FS.

Response 1: The language used to describe UXO Technicians will be defined in the report using the Department of Defense Explosive Safety Board Technical Paper 18 definitions and consistently used throughout the document.

Comment 2: The plates provided in the Draft Track 3 IA RI/FS provide a significant amount of information that is very useful to the reader. However, their utility could be improved significantly if some of the more significant features were reproduced on all of the plates numbered 3 through 11. These omissions include the identity/location of MRS-15 Mortar Alley, the Watkins Gate Burn Area outline, the Eucalyptus Fire Area outline, and Range 36A. Please revise the listed plates to include these features.

In addition, the titles for Plates 5 through 12 are somewhat misleading. The titles read. Distribution of (specific munitions type/types listed) as MEC and Munitions Debris inside the Impact Area.” This title would seem to indicate that the plates show the distribution throughout the entire impact area instead of the cleared/investigated areas, as is the actual situation. The actual distribution of MEC/munitions debris (MD) throughout the entire impact area is unknown at this time. Please revise the plate titles to read Distribution of (specific munitions type/types listed) Located to Date as MEC and Munitions Debris inside the Impact Area.” This would more accurately express what is actually displayed on the listed plates.

- Response 2: The Eucalyptus Fire Area and Watkins Gate Burn Area are shown on the plates, but the plates will be revised and the areas labeled. MRS-15 Mortar Alley, Range 36A, and Badger Flats will be added to Plates 5 through 12.
- Comment 3:** Some of the acronyms listed in the Volume 1 Acronym List differ somewhat from the definition of the same acronym in the Volume 2 Acronym List. Examples include the definitions of FFA and HLA. Also, the definition of ITRC reads “Interstate Technology and Regulatory Cooperation” in both Acronym Lists. It should read “Interstate Technology and Regulatory Council.” Please review the Acronym Lists in both volumes and ensure that the redundant definitions are consistent. Correct the ITRC definition as noted in the Acronym Lists and in the Glossary Sources listing on page xvi of Volume 1.
- Response 3: The acronym lists will be revised to make consistent across both volumes. The acronym for ITRC will be revised as suggested.
- Comment 4:** The remedial alternatives presented in the Draft Track 3 IA RI/FS do not adequately present the disadvantages of each of the alternatives. Also, it is questionable that Alternative 3, Removal to Depth MEC Remediation, would reduce the risk to surface-only receptors from C to A, yet it would have no effect (remains at E) for receptors intruding in excess of one foot below the surface. While it is correct that the removal will likely leave some MEC in place on the site, the assumption that “some MEC below 1 foot is removed” instead of “most MEC below 1 foot is removed” is conservative, yet questionable. The E risk for intrusive operations below 1 foot for an area that has undergone a proper removal action states, in effect, that the removal has been of little or no effect. This may be construed to present a case for the cessation of subsurface removal actions due to their inability to reduce risk for receptors conducting intrusive activities below 1 foot. Please review the basis for the cited determinations and include any changes deemed necessary in the revision of the Draft Track 3 IA RI/FS. Also, please explain in detail the basis for the E level of risk for intrusive operations below 1 foot for an area that has undergone a proper removal action. [Footnote: A review of the October 2002 version of the Final Fort Ord Ordnance and Explosives Risk Assessment Protocol provides the following information. (Note: This assumes that the protocol has not been modified by unpublished agreements concerning its use. This example is for the construction worker.):
1. For a removal of 100% of the DETECTED MEC (this is NOT removal of 100% of the MEC present), the Depth below Ground Surface Score is 1, per Table 5-1 on page 25 of the protocol. This assumes that the removal has met the DQOs for the sector investigated. It does not make any assumption about the percent of detection or the instrument used.

2. **For the Level of Intrusion, the Score is 5 (Highly Intrusive) from Table 5-2 of the protocol (page 26).**
3. **The Migration/Erosion Potential was previously determined to have a Score of 1 (Very Stable).**
4. **Using the Accessibility Factor Matrix (Table 5-4 on page 28 of the protocol, which combines the Depth Below Ground Surface Score (1), Level of Intrusion Score (5) and Migration/Erosion Potential Score (1), the results is an Accessibility Factor Score of 1 (Least Potential for Accessibility). This is primarily because of the 100% removal score rule noted in 1 above.**
5. **The OE Density Score is 1 (100% of Detected OE removed to Level of Intrusion) from Table 5-5 on page 31 of the protocol. Again, this score is due primarily to the 100% removal score rule.**
6. **The Intensity of Contact with Soil Score is 5 (assuming a work day of over 9 hours a day). This is from Table 5-6 on page 32 of the protocol.**
7. **The Frequency of Entry Score is 4 (Frequent) from Table 5-7 on page 33 of the protocol.**
8. **The Exposure Factor Scoring Matrix (Table 5-8) on page 35 of the protocol is used to determine the Exposure Factor. It is entered using the Frequency of Entry Score of 4 (Frequent), the Intensity of Contact with Soil Score of 5 (High-Contact more than 9 hours per day) and the OE Density Score of 1 (100% of Detected MEC removed to intrusion depth). The results are an Exposure Factor Score of 1, which is Least Potential for Exposure.**
9. **The OE Hazard Classification Score (Table 5-9, page 36) will be assumed in this example to be 3 (OE [MEC] that will kill an individual if detonated by an individual's activities.) (This assumes the worst case).**
10. **The Overall OE Risk Scoring Matrix (Table 5-10, page 38) is entered to determine the OE Risk Score using the OE Type Score (3) (OE that can kill), the Exposure Factor Score (1) (Least Potential for Exposure) and the Accessibility Factor Score (1) (Least Potential for Accessibility). The Overall Risk Score for a removal to depth of 100% of the DETECTED MEC (NOT 100% of the MEC on the site) is A (Lowest Risk) for a construction worker. Similar results are achieved for other receptors.**

A review of the Draft Track 3 IA RI/FS sections and tables related to the risk scoring reveals results that do not match those achieved by the correct application of the Final Fort Ord Ordnance and Explosives Risk Assessment Protocol. This is due to an assumption found on page 92 that violates a basic premise of the protocol. The premise that is violated is for a removal of 100% of the DETECTED MEC (this is NOT removal of 100% of the MEC present), the Depth Below Ground Surface Score is 1, per Table 5-1 on page 25 of the protocol. This assumes that the removal has met the DQOs for the sector

investigated. It does not make any assumption about the percent of detection or the instrument used. It also does not require any analysis of the potential residual MEC remaining after that 100% removal.

Response 4: The risk assessment will be revised to provide additional details on the factors used in the scoring. It is true that the protocol states that a score of 1 for depth below ground surface is likely to occur when considering remedial alternatives. For the removal to depth scenario where all detected MEC items are removed according to the data quality objectives, using a score of 1 for depth below ground surface and 1 for MEC density for all depths would result in a score of "A" (lowest risk) for all receptors. Although this is an approach that could be used, the MR BCT did not feel that a score of "A" (lowest risk) is appropriate scoring for the Impact Area MRA.

A very high density of MEC was observed at MRS- Ranges 43 through 48 during Interim Action. This indicates that the MEC density in the rest of the Impact Area MRA could be as high as that encountered at Ranges 43 through 48. In over 150 acres of Ranges 43 through 48, removal to depth using geophysical detection technology was not completed during the Interim Action due to the presence of high concentrations of metallic debris which made it impossible to identify individual anomalies to investigate. These areas would require a different approach in order to complete a subsurface MEC removal. In the periphery of such areas the density of debris is still very high. Though it has been shown that detection technologies can reliably detect most shallow subsurface MEC items, there may still be concerns about the ability of the BAT to detect MEC items at depth. In addition, because the site was used as a multi-range impact area for decades, the possibility of Type 3 MEC items remaining in the subsurface cannot be ruled out. Therefore, an after-action scoring of "A" (lowest risk) was considered inappropriate for receptors intruding below 1 foot depth.

An alternative approach, also allowable under the Fort Ord Risk Assessment Protocol, was therefore used for calculating the risk for receptors that would intrude below one foot. Similar to the application of the protocol for the Parker Flats MRA, the MEC depth below ground surface and MEC density input factors were selected based on calculated after-action MEC density below the 1 foot depth. The resulting overall risk score is "E" (highest risk) for the deeper intruding receptors.

Additional text will be included to the uncertainty analysis that indicates that the risk score of E may not be an accurate reflection of the risk below one foot, because the risk would have been reduced through the removal action; however, the Army and the regulatory agencies does not believe that the risk score of "A" or lowest risk is accurate either, due to the uncertainties that exist with removals completed below a foot using current best available technologies.

The Army anticipates that, at the time the remedial actions are completed, better technologies may be available and it may be possible to meet the established DQOs, at which point the risks could be reevaluated using the Risk Assessment Protocol or other future method developed to evaluate risk at MRSs.

Comment 5: It is unclear why a Remedial Alternative (or alternatives) including an instrument assisted surface removal is not presented in the Draft Track 3 IA RI/FS. As controlled burning is to be conducted prior to the surface removals, it would appear that an instrument would assist in locating surface MEC and MD covered by ash and other materials deposited by the burn. Please explain this omission in detail or include instrumented surface removal in the Remedial Alternatives presented in the Draft Track 3 IA RI/FS.

Response 5: MEC detection instruments will be available on site to check for MEC in areas where the soil surface is not visible. Section 3.3.2.1.1 will be revised to include a description of this protocol for areas where the soil surface is not visible.

SPECIFIC COMMENTS – Volume 1

Comment 1: Section 1.1, Description of the MR RI/FS Program, page 2: In the second paragraph of the section, it is stated that, “Three categories of sites have been identified, Track 0 through Track 3.” This would appear to include four categories instead of the three as noted. Please review the cited sentence and correct it as necessary.

Response 1: The sentence will be revised to state that there are four Tracks or categories. It will read “Four categories of sites have been identified, Track 0 through Track 3.”

Comment 2: Section 2.2.1, Location, page 11: The first and second sentences of this section note that, “The Impact Area MRA is located in the southwestern portion of the former Fort Ord. The area covers approximately 8,000 acres and is bounded by Eucalyptus Road to the North, Barloy Canyon Road to the east, South Boundary Road to the south, and General Jim Moore Boulevard to the west.” The 8,000 acre number does not agree with the 6,560 acre number given in Section 2.1, Definition of Impact Area MRA, found on page 6 of Volume 2 of the Draft Track 3 IA RI/FS. The 6,560 acre number is also found in other sections of Volume 2. Please review the Draft Track 3 IA RI/FS and revise it as necessary to ensure that the correct acreage is provided throughout both volumes.

Response 2: The text will be revised to clarify that the historical Impact Area was approximately 8,000 acres, but that the portion of the Impact Area included in this RI/FS as the Track 3 Impact Area MRA is 6,560 acres. The text will be modified as follows:

“The historical Impact Area is located in the southwestern portion of the former Fort Ord. The area covers approximately 8,000 acres and is bounded by Eucalyptus Road to the North, Barloy Canyon Road to the east, South Boundary Road to the south, and General Jim Moore Boulevard to the west. The firing ranges were located approximately along the perimeter of the historical Impact Area such that weapons firing was generally directed toward the center of the Impact Area.

The Impact Area MRA consists of 6,560 acres of the 8,000 acre historical Impact Area designated for transfer to BLM as Habitat Reserve. Portions of the historical Impact Area not included in the Impact Area MRA consist of the MOUT which will continue to be used as a training facility, the northern and western edges of the Impact Area that are designated for development, and a portion of habitat reserve in MRS-Ranges 43-48 that is not designated to be transferred to BLM (Plate 2)”.

Comment 3: Section 2.2.2, General History, page 11: The first paragraph of this section contains the following statements:

- **“By 1961, numbers had been assigned to some of the ranges following the numbering scheme already in use at the beach trainfire ranges. A training map from 1964 indicates that by this date all of the ranges within the Impact Area were consecutively numbered. The locations and limits of the individual trainfire ranges have not changed appreciably since that time. At the time of base closure, thirty ranges (numbered 18 through 48) were active or considered operational.”**

It is unclear as to whether the term “trainfire” is intended to refer to the small arms (primarily rifle) ranges, which is correct use of the term, or if it is intended to include all of the ranges numbered 18 through 48, which would be incorrect use of the term.

Trainfire was an Army program established after a post-Korean Conflict study revealed that many soldiers involved in direct combat with the enemy did not fire their individual weapons, or if they did fire them, they often did not aim them at individual enemy soldiers. It was primarily used to train soldiers to fire their rifles at the enemy and did not include crew served or anti-armor weapons.

Please correct the cited statements to remove the noted ambiguity.

Response 3: The text will be revised as follows: *“By 1961, numbers, beginning with 18, had been assigned to some of the ranges within the Impact Area following the numbering scheme already in use at the beach trainfire ranges (designated 1 through 17). A training map from 1964 indicated that by this date all of the ranges*

within the Impact Area were consecutively numbered. The locations and limits of the individual ranges have not changed appreciably since that time.”

Comment 4: Section 3.2, Track 3 Impact Area MRA Munitions Response Site History and Development, page 30: In the last paragraph of this section it is stated that, “Range control records and interviews indicate the firing points were used by artillery divisions utilizing 105mm howitzers and were fired at targets within the Impact Area.” The use of the term “artillery divisions” is incorrect. The U.S. Army does not, nor did it during the active life of Fort Ord, have any artillery divisions. Artillery assigned to a division was referred to as “Division Artillery” or by the term “DivArty.” That unit consisted of artillery battalions and batteries (during the World War I time period there were also artillery regiments). Please change the term “artillery divisions” to read “artillery units.”

Response 4: The text will be revised as suggested. Artillery divisions will be revised to artillery units as follows: “Range control records and interviews indicate the firing points were used by artillery units utilizing 105mm howitzers and were fired at targets within the Impact Area”.

Comment 5: Section 3.3.1, History of Investigations, page 31: In the subsection entitled Grid Sampling, the last sentence in the first paragraph notes that some of the MEC items found included, “...blasting caps for practice hand grenades...” A review of the After Action report for MRS (OE)-15A determined that these items were reported in that document as being recovered on the site as “...for practice hand grenades...” This is incorrect, as there are no blasting caps used on any fuzes designed for practice hand grenades type classified by the Department of Defense. As there have been instances where fragmentation (HE) hand grenade fuzes have been used in practice grenade bodies, it is possible that someone removed the blasting cap (detonator) from these fuzes and discarded them in the impact area. In any case, the “blasting caps” did not come from a practice hand grenade fuze type classified as such. This statement, if allowed to remain in the Draft Track 3 IA RI/FS, may give the public the incorrect impression that practice hand grenades normally contain blasting caps. Please revise the cited sentence to remove the words “for practice hand grenades.”

Response 5: The text will be revised as suggested. The words “for practice hand grenades” will be removed and the sentence will read as follows: *MEC and munitions debris removed from the sample grids included practice and illuminating projectiles, practice and smoke producing hand grenades, practice rockets, blasting caps, and a rifle fired smoke grenade (USA, 2000a).*

Comment 6: Section 3.3.1, History of Investigations, page 38: In the subsection entitled Watkins Gate Burn Area, the last sentence beginning on that page and

continuing on page 39 reads, “Four-hundred ninety-nine MEC items and munitions debris (68,590 pounds [lbs]) were removed under the TCRA.” As it is currently constructed, the sentence may be interpreted two ways. It could be read to mean that there was a total of 499 MEC items and munitions debris (MD) and this total weighed 68,590 pounds. It could also be read to mean there were 499 MEC items and there was also 68,590 pounds of MD found and removed. Please restructure the cited sentence to remove the noted ambiguity.

Response 6: The sentence will be revised as follows: “*Four-hundred ninety-nine MEC items and 68,590 pounds (lbs) of munitions debris were removed under the TCRA*”.

Comment 7: Section 3.3.1, History of Investigations, page 39: In the subsection entitled Digital Geophysical Transects Sampling, a sentence is found that reads, “A large number of ‘pop-out pins were identified in one of the Range 18 sample grids and this may have been the firing point for the 60mm mortars (USA, 2000a).” No explanation as to what a “pop-out pin” is or what it does is provided. Please insert the following explanation (or similar wording) in the section to explain what a “pop-out pin” is and what it does: “The ‘pop-out pin’ is a fuze safety device that is partially released from the fuze upon the mortar firing. It is a spring-loaded ‘bore-rider’ that keeps the fuze safe until the fuze and projectile exits the mortar tube. At that time it is ejected completely from the fuze and final arming is allowed to proceed. The presence of these pins indicates that the mortars were fired within approximately 50 feet of their location.”

Response 7: The text will be revised to include the explanation of what a pop-out pin is and what it does. The following will be added. “*The pop-out pin is a fuze safety device that is partially released from the fuze upon the mortar firing. This pin rides up the bore of the mortar until it clears the muzzle, whereupon it is ejected from the fuze.*”

Comment 8: Section 3.3.1, History of Investigations, page 40: In the subsection entitled Eucalyptus Fire Area, the last sentence in the subsection reads, “Munitions debris consisted primarily of 3.5-inch practice rockets, practice hand grenades, hand grenade fuzes, dummy rockets, and signals.” As currently written, this sentence may lead the reader to think that practice grenades are always munitions debris (MD). Please revise the sentence to read, “Munitions debris consisted primarily of 3.5-inch practice rockets (expended), practice hand grenades (expended), hand grenade fuzes (expended), dummy rockets, and signals (expended).”

Response 8: The text will be revised as suggested.

Comment 9: Section 3.4, FTO Battelle-Oak Ridge National Laboratory (ORNL) Airborne Geophysical Survey, page 54: The last sentence in this section reads, “As stated above, the information should not be used to identify areas that may be free of contamination.” However, that is not exactly what is stated above. The referenced statement is that, “Accordingly, Battelle concludes ‘airborne data are not suitable for declaring an area free of contamination (because) some MEC types fall below the detection threshold of the system and only a percentage of other ordnance types will be detected.’ While the data are suitable for IDENTIFYING areas that may be free of contamination, the results cannot be used to DECLARE an area free of contamination. Please revise the cited sentence to reflect this difference.

Response 9: The text will be revised as suggested. The sentence will be modified as following: *“As stated above, the information should not be used to declare an area free of contamination.”*

Comment 10: Section 3.5.1, Training Practices, pages 55 and 56: The subsection entitled World War II Training contains a table (untitled) that lists military munitions that may have been used on specific ranges in the impact area. In the row of the table labeled Live Hand Grenade Range, the distance that the listed grenades may be thrown is shown as 25 meters. FM 23-30 (Grenades and Pyrotechnics) notes that the average soldier can throw a MK II fragmentation grenade 30 meters and an MK IIIA1 offensive hand grenade 40 meters. Please make these corrections.

In addition, in the row labeled Artillery Training, the maximum range for the 8-inch howitzer is shown as 13,400 yards. It is actually 18,510 yards, unless the charge used is limited by safety requirements. Please review this maximum range and correct it as necessary.

Response 10: The table will be revised as suggested. The maximum range description for live hand grenades will be modified as follows *“NA, Average throwing distance for a MK II is 30 m, and for a MK IIIA1 is 40 m. Frag danger zone 150-meters (m).”* The maximum range description for practice hand grenades will be modified as follows: *“NA, Average throwing distance – 30 m.”* The maximum range description for 8 inch projectiles will be changed to *“8-inch; approximately 5,900 to 18,510 yards.”*

Comment 11: Section 3.5.1, Training Practices, pages 57 and 58: The subsection entitled 1950s Training contains a table (untitled) that lists military munitions that may have been used on specific ranges in the impact area. In the row of the table labeled Live Hand Grenade Range, the distance that the listed grenades may be thrown is shown as 25 meters. FM 23-30 (Grenades and Pyrotechnics) notes that the average soldier can throw a MK II fragmentation grenade 30 meters and an M26 fragmentation hand grenade 40 meters. Please make

these corrections.

Also, the row labeled 57mm Recoilless Rifle only lists the M306 series HE projectile and the M306A1 target practice projectiles. The M308 series smoke (white phosphorous) projectile and the M307 series HEAT projectiles have been found downrange, so it would appear that these were also fired. Please add these projectiles to the list as noted.

In addition, in the row labeled Artillery Training, the maximum range for the 8-inch howitzer is shown as 13,400 yards. It is actually 18,510 yards, unless the charge used is limited by safety requirements. Please review this maximum range and correct it as necessary here and at any other occurrences in the Draft Track 3 IA RI/FS (i.e., on page 60).

Response 11: The table will be revised to correct the throwing distances for the hand grenades, include the M307 series HEAT and M308 series smoke projectiles, and correct the maximum range of the 8-inch howitzer. See above for changes related to hand grenades and 8-inch projectiles. The 57mm Recoilless Rifle Range entry will be changed as follows: Military Munitions that may be used Column – *57mm M306 Series HE projectile, M306A1 target practice projectile, M307 series HEAT projectile, and M308 series smoke (white phosphorous)*. The maximum range column will also be updated to include the maximum range for the M307 HEAT of 6,364 m and the maximum range for the M308 series smoke of 400 m).

Comment 12: **Section 3.5.1, Training Practices, page 62: The subsection entitled Recoilless Rifles-57mm does not list the M308 series smoke (white phosphorous) projectile and the M307 series HEAT projectiles, both of which have been found downrange. Please add these projectiles to the list as noted.**

Response 12: The text will be revised to include the M307 series HEAT and M308 series smoke projectile as follows: *“The maximum range for the 57mm projectile is approximately 6,500 meters. 57mm projectiles HE and practice could be found down range of the 57mm recoilless rifle range and could extend into the center of the Impact Area. In addition M307 series HEAT projectiles and M308 series smoke (white phosphorous) could be found downrange.”*

Comment 13: **Section 3.5.1, Training Practices, page 64: The subsection entitled Practice Hand Grenades lists the throwing range of the practice grenades as “about 25m.” The correct distance is 30 to 40 meters (depending on the model thrown) per FM 23-30 (Grenades and Pyrotechnics). Please make this correction.**

Response 13: The text will be revised as follows: *“Because practice hand grenades can only be thrown about 30 to 40 m, they would be expected to be localized near the targets and not be found further down range.”*

Comment 14: Section 3.5.3.2, Vertical Distribution, page 78: The first paragraph of the subsection entitled Watkins Gate Burn Area contains a sentence that reads, “The results of the survey indicate the potential for more buried items to be present in the areas with high anomalies per foot, than in areas with low anomaly per foot densities.” The use of the word “buried” in the cited sentence raises a question. Is it the intent of this sentence to state that there is a greater potential for subsurface MEC to be present as a result of firing, or that there is a greater potential for purposely buried MEC to be found there in burial pits? Please clarify this and, if the intent is to indicate the presence due to firing activities, please replace the word “buried” with the word “subsurface.” Also, if the intent is to express a potential for more burial pits, please expand this subsection to explain why this is the case.

Response 14: The text will be revised as follows: *“The results of the survey indicate the potential for more subsurface items to be present in the areas with high anomalies per foot densities.”*

Comment 15: Section 5.1.1, Site Use and Development, page 101: The first four bullets in this section are a listing of the types of training conducted at the installation prior to its closing. There are some omissions from the listings contained therein. Please review the listing and correct it as necessary to address the following concerns:

- When was training conducted with the larger artillery weapons listed in the tables contained in Section 3.5.1, Training Practices?
- When was the training with the 4.2-inch mortar conducted?
- Was any training conducted in the area using mines?
- Which weapons fired white phosphorous projectiles?

Also, in the fifth bullet on page 102, the word “in” appears to be a typographical error.

Response 15: The text will be revised to include the requested information.

Comment 16: Appendix B, MEC and Munitions Debris Removed from the Impact Area, Table B7, MRS-15 Range 30A, page 1 of 6: Line 16 of the table has an item listed with the nomenclature of “M430” in the column labeled “MM Item Description.” It would appear that the correct nomenclature for this item is Projectile, 40mm, HEDP, M430. If this is correct, please enter it into the table. If it is incorrect, please provide the correct entry in the table.

Response 16: The entry was cut off in the table. The full entry is Projectile, 40mm, high explosive dual-purpose, M430. The table will be reformatted so the entry is not cut off.

Comment 17: Appendix B, MEC and Munitions Debris Removed from the Impact Area, Table B7, MRS-15 Range 30A, page 4 of 6: Line 6 of the table has an item listed with the nomenclature of “M430” in the column labeled “MM Item Description.” It would appear that the correct nomenclature for this item is Projectile, 40mm, HEDP, M430. If this is correct, please enter it into the table. If it is incorrect, please provide the correct entry in the table.

Also, on lines 19 and 20 of the table, two items are listed that have the nomenclature of “series” in the column labeled “MM Item Description.” Please provide the correct nomenclature for these two items in the table.

Response 17: The entries were cut off in the table. The full entries are 40mm, high explosive dual-purpose, M430 and Projectile, 60mm, mortar, practice, M50 series. The table will be reformatted to the entries are not cut off.

Comment 18: Appendix B, MEC and Munitions Debris Removed from the Impact Area, Table B8, MRS-15 BLM: There are a number of entries in the table that have a red asterisk in the column labeled “MM Item Description.” All of these items have the words “Model Unknown” in their description as well. The purpose of the asterisk is not explained in the table. Please provide a note in the legend at the end of the table to explain the purpose of the red asterisks.

Also, there are a number of munitions items on page 5 of 11 that have a model number listed followed by the words “Model Unknown” in the “MM Item Description” column of the table. As these two situations are in conflict, please correct these entries as necessary.

Response 18: The table will be revised to provide a footnote identifying the information noted by the asterisks. Entries that have a model number followed by “Model Unknown” are the result of database quality control review process during which conflicting information concerning the item made it impossible to conclusively assign a correct model number.

SPECIFIC COMMENTS – Volume 2

Comment 1: Section 2.2.1, Application of Risk Assessment Results, page 12: The second bullet in this section reads as follows:

“The potential After Action MEC Risks associated with a removal to depth for all receptors intruding below 1 foot remain highest risk (E). For shallow intruding receptors (those intruding less than 1 foot) and surface only receptors, the risk is lowest (A). It was assumed that all MEC encountered

and detected on the surface and below ground surface would be removed. However, based on the potential limitations of the detection equipment and procedures, it would not be possible to verify that all MEC items were removed to all depths. Therefore, for the removal to depth scenario, the risk assessment assumed nearly all items would be removed in the top 1 foot below ground surface, and some MEC would remain below a depth of 1 foot below ground surface.”

While this is a very conservative approach that is to be applauded from a safety perspective, by assuming that the risk from MEC after a removal to depth is basically the same as that after a 1 foot removal, the assumption will tend to result in the removal to depth alternative being rejected due to its much higher cost. If this basic approach is followed during the risk assessment process on subsequent RI/FS, removal below the 1 foot depth could potentially be eliminated as a viable option at the former Fort Ord.

Please review the basis for determining that the risk is not reduced by a removal of all detectable MEC to depth for those individuals conducting intrusive activities below the 1 foot depth.

Response 1: Please see response to EPA General Comment 4.

The risk assessment will be revised to provide additional details on the factors used in the scoring. It is true that the protocol states that a score of 1 for depth below ground surface is likely to occur when considering remedial alternatives. For the removal to depth scenario where all detected MEC items are removed according to the data quality objectives, using a score of 1 for depth below ground surface and 1 for MEC density for all depths would result in a score of “A” (lowest risk) for all receptors. Although this is an approach that could be used, the MR BCT did not feel that a score of “A” (lowest risk) is appropriate scoring for the Impact Area MRA.

A very high density of MEC was observed at MRS- Ranges 43 through 48 during Interim Action. This indicates that the MEC density in the rest of the Impact Area MRA could be as high as that encountered at Ranges 43 through 48. In over 150 acres of Ranges 43 through 48, removal to depth using geophysical detection technology was not completed during the Interim Action due to the presence of high concentrations of metallic debris which made it impossible to identify individual anomalies to investigate. These areas would require a different approach in order to complete a subsurface MEC removal. In the periphery of such areas the density of debris is still very high. Though it has been shown that detection technologies can reliably detect most shallow subsurface MEC items, there may still be concerns about the ability of the BAT to detect MEC items at depth. In addition, because the site was used as a multi-range impact area for

decades, the possibility of Type 3 MEC items remaining in the subsurface cannot be ruled out. Therefore, an after-action scoring of “A” (lowest risk) was considered inappropriate for receptors intruding below 1 foot depth.

An alternative approach, also allowable under the Fort Ord Risk Assessment Protocol, was therefore used for calculating the risk for receptors that would intrude below one foot. Similar to the application of the protocol for the Parker Flats MRA, the MEC depth below ground surface and MEC density input factors were selected based on calculated after-action MEC density below the 1 foot depth. The resulting overall risk score is “E” (highest risk) for the deeper intruding receptors.

Additional text will be included to the uncertainty analysis that indicates that the risk score of E may not be an accurate reflection of the risk below one foot, because the risk would have been reduced through the removal action; however, the Army and the regulatory agencies does not believe that the risk score of “A” or lowest risk is accurate either, due to the uncertainties that exist with removals completed below a foot using current best available technologies.

The Army anticipates that, at the time the remedial actions are completed, better technologies may be available and it may be possible to meet the established DQOs, at which point the risks could be reevaluated using the Risk Assessment Protocol or other future method developed to evaluate risk at MRSs.

Comment 2: Section 3.2.3, Construction Monitoring, page 28: The first sentence in this section notes that, Construction monitoring would be performed by qualified MEC personnel (military munitions specialists) during any intrusive or ground-disturbing construction activities at the Impact area MRA...” While the use of the undefined terms “qualified MEC personnel” and “military munitions specialists” has been addressed in General Comment 1 above, the use of the term “military munitions specialists” deserves additional comment. The Army currently has a number of non-UXO qualified job titles that fit into the category of “military munitions specialists.” For example, an Ammunition Supply Specialist or an Ammunition Specialist would not be qualified to perform construction monitoring. Please correct the cited sentence in accordance with the comments provided here and in General Comment 1.

Response 2: The text will be revised as suggested.

Comment 3: Section 5.1, Evaluation of Remedial Alternatives, page 60: Alternative 2, Visual Surface MEC Remediation, found in the subsection entitled Overall Protection of Human Health and the Environment, has a sentence that reads as follows:

“However, because MEC would not be removed from the subsurface that would potentially pose MEC risks to reusers conducting intrusive activities during reuse, this alternative would be protective of human health for receptors conducting intrusive activities in combination with Land Use Controls that include MEC recognition training and escorted access by qualified personnel, and construction monitoring during any intrusive activities.”

This sentence is very long and is difficult to understand. Please revise the cited sentence to better express the intended meaning.

Response 3: The text will be revised as suggested.

Comment 4: Section 5.1.8, State Acceptance, pages 72-73: With the exception of Alternative 1, No Further Action, the assumption is presented that all of the alternatives are “...likely to be acceptable to the regulatory agencies...” This is somewhat questionable, as the removal of surface MEC with no subsurface removals on the roadways, trails, and fuel breaks would seem to be less acceptable than a complete subsurface removal throughout the entire impact area. Please review the wording of the quoted statement found in the listed alternatives and modify them as deemed necessary.

Response 4: The text will be revised as suggested to provide additional detail for each of the alternatives.

Comment 5: Section 5.1.9, Community Acceptance, pages 73-74: With the exception of Alternative 1, No Further Action, the assumption is presented that all of the alternatives are “...likely to be acceptable to the public...” This is somewhat questionable, as the removal of surface MEC with no subsurface removals on the roadways trails, and fuel breaks would seem to be less acceptable than a complete subsurface removal throughout the entire impact area.

Please review the wording of the quoted statement found in the listed alternatives and modify them as deemed necessary.

Response 5: The text will be revised as suggested to provide additional detail for each of the alternatives.

**USEPA Supplemental Comments
Letter dated November 9, 2006
COMMENTS**

GENERAL COMMENTS

Comment 1: The MRS-16 burn went very well and the Army team and POM fire department did an outstanding job. However, the 58 acre fire produced a significant amount of smoke. EPA is concerned with the large acreage the Army proposes for prescribed burns in the Track 3 RI/FS. As noted at the Track 3 RI/FS meeting in September 2006, EPA had the understanding after the 2003 prescribed burn at Ranges 43-48 that future prescribed burns would be 100 acres or less in size, like MRS-16. However, the Army said that EPA had misunderstood and that they had simply proposed that future prescribed burns would be smaller. EPA understands that the Army needs to burn the acreage to remove the MEC and that this is the overall goal. But we are concerned that in the RI/FS, the Army proposes (for Alternatives 2 and 4) 800 acres of prescribed burning per year in two 400 acre increments. We are concerned that significant smoke will be generated and no relocation offered to help minimize smoke impacts. EPA understands that the average impact area polygon is approximately 400 acres, but had understood that the Army was looking to make these polygons smaller and hence result in smaller prescribed burns. The Army should analyze the feasibility of creating these smaller polygons and additional fire breaks in the RI/FS. These subdivisions of polygons and creation of fuel breaks do not have to be permanent. They can be temporary. If feasible, the Army could split each 400 acre polygon into 4 smaller polygons with the creation of temporary fuel breaks that are only surface cleared. The Army could achieve 400 acre prescribed burns by conducting 100 acre prescribed burns over 4 consecutive days. Also, the Draft Track 3 RI/FS does not discuss the basis for the 400 acre sized (or 300 acre for Alternative 3) prescribed burns and up to 800 acres of prescribed burns per year or the implementability thereof in section 5 of the FS. This discussion should be added. Finally, please clarify the size of the fuel breaks proposed for the impact area. The draft RI/FS briefly discusses the size of existing fuel breaks (45-50 feet) but does not indicate whether these fuel breaks will be enlarged to 150 feet as they were for MRS-16.

Response 1: As described in the FS, a phased approach of conducting prescribed burning and MEC remedial actions on approximately 800 acres per year is allowed in accordance with the HMP for which prescribed burning is implemented in Habitat Reserve areas at the former Fort Ord. Each prescribed burn area will not exceed 400 acres (separated by a minimum of 25 acres to allow a mosaic pattern consisting of difference age classes of vegetation) as specified under the HMP,

unless specifically coordinated with USFWS. Therefore, under the Surface MEC Removal remedial alternative, prescribed burning and MEC removal could be conducted on up to 800 acres per year. The 300 acres per year assumed under the MEC Removal to Depth alternative is based on the longer duration to conduct the removals prior to vegetation regrowth.

It is anticipated that the prescribed burns will be conducted in stages and consist of several small burns rather than one large burn. An implementation work plan will be prepared prior to each phase of work. The implementation plan will include a burn plan. This burn plan will describe the locations and widths of temporary and permanent fuel breaks, and the number and size of burns that will be required. The text will be revised to clarify the basis for the proposed acreage, and provide additional details on the implementation plan.

Comment 2: If the RI data and conceptual site model derived from it can be used to determine where the high explosive, penetrating and most dangerous munitions are likely to be in the subsurface, should the Army consider trying to do some spot subsurface clearance to remove these dangerous munitions thereby giving more long term protection? Or if upon the surface removal it is clear that dangerous items are just below the surface – should the FS discuss the possibility of removing them?

Response 2: The response actions will be conducted in stages as described in the FS. A site specific implementation work plan will be developed for each phase of work. The plan will describe the anticipated distribution of MEC, the vegetation clearance plan, and the method for completion of the response. It is anticipated that following the surface removal, the digital geophysical scan will be completed and the data will be presented to the BCT. The BCT will review the data and determine if additional actions (subsurface removal) are necessary. The review will include an evaluation of whether additional actions are consistent with the ARARs including the HMP and Biological Opinions. The text of the FS will be revised to include additional information on this proposed approach. A Technical Memorandum will be prepared documenting the decision reached in the BCT. To avoid impacts to the rare, threatened and endangered species seed bank, completion of the TM will need to be expedited to allow any additional actions to be executed before the next growing season. Additional details on the BCT review step will be added to the FS. In general, factors that would be considered when determining whether additional action, such as subsurface removal are required, include, but are not limited to:

- Type of MEC encountered and danger associated with the MEC
- Proximity to potential receptors
- Density of items
- Consistency with ARARs.

The text of the FS will be revised to include additional information on this proposed approach.

Comment 3: **The Track 3 RI/FS should note upfront that only the physical hazards from MEC are being assessed and addressed (for example, the last sentence on page 82 – include this same sentence on page 1.)**

Response 3: The information appears on page 2, but will also be added to page 1.

Comment 4: **The Track 3 RI/FS uses MEC data from Ranges 43-48 and emphasizes that it likely represent a worst case MEC scenario in terms of nature of items and densities. If this is the case, the RI may overestimate MEC densities and hazards in the 6560 acre Track 3 RI/FS impact area and hence may overestimate the costs of cleanup as well. Since the major difference between the various alternatives in the Draft Track 3 RI/FS is cost, EPA wants assurances that the cost estimates are reasonable and supported. After reviewing the FS, EPA is not in full agreement with the cost assumptions and is concerned that costs for Alternatives 3 and 4 are not reasonable and may be too high. Also see general Comment 9 below about revising the FS to ensure it is clear that more than just cost distinguishes the FS Alternatives 2-4.**

Response 4: The text will be revised to provide additional discussion on the basis for the cost assumptions and differences between the alternatives based on the other criteria.

Comment 5: **Ensure updated 43-48 data from final Technical Information Paper (TIP) is included in the revised RI/FS for Track 3.**

Response 5: The report will be updated to incorporate data from the most recent version of the Ranges 43 through 48 TIP.

Comment 6: **EPA would like to discuss the possibility of the revised FS including an alternative with a MEC-cleared buffer along the impact area perimeter fence proximate to adjacent residential areas to protect them from MEC in the event of a wildfire and to better protect potential trespassers near the fence-line. A buffer might also protect firefighters responding to wildfire. EPA understands that preliminary cost estimates for such a buffer are high and that as a result the buffer would likely be no more than 100-200 foot wide.**

Response 6: The Draft Final Track 3 MR RI/FS includes, as part of Alternative 4, a 100 foot-wide removal-to-depth buffer along the inside of the habitat-development border of the Impact Area MRA. This buffer would act as an additional safety zone that would give firefighters an ability to fight wildfires that might occur within the Impact Area. The firefighters would be able to temporarily widen fuelbreaks under such circumstances, to protect life and property on the development side of the border.

Comment 7: Because of the prescribed burn/relocation history, The Army should provide a detailed explanation as to why relocation was not considered in any of the FS alternatives or perhaps include it in an alternative and thus through the 9 criteria analysis show why it is not necessary. Otherwise the public is left to wonder.

Response 7: The text will be revised to provide additional discussion of the reasons relocation was not included as a component of prescribed burning.

Comment 8: For alternatives including the preferred alternative where MEC is left in place in the subsurface, there should be a prohibition on unrestricted uses such as residential.

Response 8: The text will be revised to include the prohibition on unrestricted uses such as residential.

Comment 9: For the FS alternatives and comparative analysis of alternatives, the primary difference between the alternatives is cost. Please provide additional discussion and summary in Table 2 to more clearly separate the various alternatives and provide clearer support for the preferred alternative. For example, Alternatives 2-4 are all protective but clearly just removing surface MEC could be interpreted as less protective particularly for potential subsurface users than an alternative that proposes removing all MEC to depth. Same with long term effectiveness – the more MEC that is left in place, the more long term controls will be required to protect future users. Also, for Alternative 3, there may be so called special case areas (SCAs) that cannot be fully excavated due to the high density of anomalies. As a result Alternative 3 may not be as protective in the long term or as implementable. Also it is probably worthwhile stating that as far as implementability, Alternative 3 is not highly implementable or likely to be in full compliance with endangered species ARARs because of the likely necessary destruction of endangered habitat. Also, it would be reasonable to provide assumptions for state (regulatory) and community acceptance. For example it is likely that the community would support cleaning up more MEC but not the destruction of endangered habitat. Also may want to note that the members of the community have voiced concerns with prescribed burns in the past so Alternative 3 which proposes many more years of prescribed burning would likely be less acceptable to the community. Any of the alternatives with prescribed burning will likely result in some community concern because relocation is not being offered but the community should also support the overall goal of removing dangerous MEC from the impact area. For the state (regulatory) acceptance, more cleanup (BLM, DTSC) is preferred but destruction of habitat is not (USF&W). State/regulatory acceptance could also discuss that DTSC will likely want and support alternatives with institutional

controls like construction support and land use controls (e.g., prohibiting unrestricted uses) that provide additional protection for future users. These are just some initial thoughts on revisions to the alternatives discussion in the RI/FS. Please revise the FS alternatives sections to include more information by which to compare the alternatives vs. the 9 criteria and each other.

Response 9: The text and associated tables will be revised to provide additional discussion on the differences between the alternatives based on the 9 criteria.

VOLUME 1 OF 2, REMEDIAL INVESTIGATION

Comment 1: Page 1, second paragraph, Second word. Typographical error, “distingues” – is it supposed to be distinguishes or designates?

Response 1: The text will be revised to correct the error to be “distinguishes”.

Comment 2: Page 9, section 2.1.2, first sentence: add “in 1991,” after “Fort Ord.”

Response 2: The text will be revised as suggested.

Comment 3: Page 10, Summary of Existing MR Program. Shouldn’t this also include interim actions at 43-48 and MRS-16 and various RI/FSs on Tracks 0-2? Otherwise, change the title of the section to better clarify.

Response 3: The text will be revised to include information on the Interim Action ROD and actions taken at Ranges 43 through 48 and MRS-16.

Comment 4: Page 12, Section 2.2.3.3. SUMP (1995b) – please provide additional information on this document. This is a USACE document about how BLM will manage the site? How does it relate to the 2004 Draft Proposed Management Plan by BLM Hollister office? Also may want to include the Draft BLM 2004 plan as an appendix to the Track 3 RI/FS.

Response 4: Since base closure, the Army has been coordinating with BLM regarding the management of habitat reserve within the former Impact Area. The 1995 SUMP and 1997 HMP outline agreements on conceptual reuse and management of the Impact Area based on MEC cleanup expectations at the time. Since then, BLM has provided several updates on its plans for reuse and habitat management. These documents include the 2004 draft Proposed Management Plan, 2006 Proposed Resource Management Plan/Final Environmental Statement, and 2006 draft HCP (provided as part of the BLM comments to the draft Track 3 MR RI/FS). The Army recognizes that detailed plan for managing the habitat reserve in the Impact Area may change as new information becomes available during the HCP process.

However, this RI/FS considers all available information in order to construct a remedial alternative that ensures habitat management requirements of the HMP/HCP can be implemented within the Impact Area habitat reserve. The text will be revised to include additional information on the SUMP as well as the draft HCP which replaces the Draft BLM 2004 plan.

Comment 5: Page 13, first paragraph –“three unique future reuse designations” – the text appears to mention 4. Also the unrestricted/ urban development designation per the first bullet needs additional detail here – what is BLM proposing?

Response 5: The text will be revised to eliminate the reference to unrestricted/urban development reuse. This reuse is not planned for the Impact Area MRA.

Comment 6: Page 14, second paragraph, first sentence. Regarding 2004 BLM Proposed Management Plan. Note that this was BLM’s first, draft attempt at proposing potential future uses for the former impact area in response to the Army’s request. Note that the plan is draft and may change.

Response 6: The Draft 2004 BLM Proposed Management Plan was not the first attempt by BLM to propose potential uses within the Impact Area. The SUMP was developed in close coordination and signed by BLM as the first attempt to identify potential uses of future BLM lands within the Impact Area. The text will be revised to reference the document as draft. The HCP is draft, and the BLM resource plan is final (*BLM, 2006*). Please also see response to Comment 4 above.

Comment 7: Page 20, Regulatory background. Note USF&W/HMP? Refer back to page 17?

Response 7: The text will be revised to include a discussion on the regulatory participation by the U.S. Fish and Wildlife Service (USFWS). Consultation with the USFWS on remediation of MEC has been completed resulting in a biological opinion including incidental take limits. If the Track 3 RI/FS results in impacts to HMP species not previously considered, the Army will consult with the USFWS in accordance with the Endangered Species Act.

Comment 8: Page 21, second and third paragraphs. Please provide additional detail in the text regarding the November 1998 and April 2000 agreements. Please note who the agreements are with, etc.

Response 8: The text will be revised to provide additional detail regarding the agreements.

Comment 9: Page 24, Impact Area Investigations, first bullet. Where was the 100 percent sampling performed? Is it the grid pattern shown on Plate 2? If so, these include the excluded areas of the Track 3 RI/FS impact area. Also, the 43-48 grids are not shown.

Response 9: The 100 percent sampling is shown on the map. The grids completed within the Track 3 Impact Area Munitions Response Area will be presented in a different color than grids completed outside the boundary. The grids completed at Ranges 43 through 48 will be added to Plate 2.

Comment 10: Page 28. First paragraph. The impact area is described here as being 6560 acres in size. In other documents EPA has seen it described as 8000 acres and 7000 acres. If one adds up the individual acreage noted in the polygon map (10/31/03) it is closer to 7500. So what is the acreage? Is the 6560 in the RI/FS excluding the various parcels like Seaside 1-4? Please clarify. Also, it would be helpful to have a map clearly showing the excluding parcels and their acreage.

Response 10: The 6,560 acre number excludes the parcels inside the Impact Area that would not be transferred to BLM. A new map will be generated to better show the areas of the Impact Area that are included in the Impact Area MRA.

Comment 11: Page 28, section 3.1 vs. Page 30, second paragraph, last sentence: At time of base closure – 30 ranges or 29 ranges active? Earlier in the RI, 30 ranges was used (page 11, last sentence).

Response 11: Based on review of the October 7, 2002 Standard Operating Procedures (SOP) 28 ranges were active at Base Closure.

Comment 12: Plates 3 and 4. If possible, please ensure that the titles of these plates are visible while folded the clear sleeves in the document.

Response 12: The plate folds will be modified to ensure that the titles of the plates are visible within the sleeves.

Comment 13: Page 32-33, Fuel breaks. Fuel breaks are 45-50 feet in width. At MRS-16 the perimeter fuel breaks were 150 feet wide. The Track 3 RI/FS should also include clearance of fuel breaks to 150 feet.

Response 13: Permanent fuel breaks within the Impact Area are maintained at 45 to 50 feet wide. However, wider temporary fuel breaks are created by cutting vegetation (not grubbing or disking) within a distance established by the Fire Department to reduce risk of an escape. In the case of MRS-16, a 150-foot wide perimeter surrounding the MRS site was cleared of vegetation with larger oak trees being pruned. Three sides of MRS-16 were also bounded by asphalt roads creating a total of approximately 200 feet of “fuel break.” These wider breaks are temporary and will not prevent protected habitat and species from recovering per the requirements of the HMP.

Please see response to Supplemental EPA Comments, General Comment 1.

Comment 14: Page 36-38. Discuss high density special case areas. Ensure this section is updated based on the final 43-48 TIP.

Response 14: The text will be revised to include a discussion of the high density MEC areas and incorporate data from the most recent version of the Technical Information Paper.

Comment 15: Page 41, last bullet. Is Badger Flats on Plate 2 or another plate? Not sure where it is.

Response 15: Badger Flats will be added to Plate 2 and subsequent plates.

Comment 16: Page 42, Range 36A. Please update in revised RI/FS.

Response 16: The text will be revised to include a discussion of the most recent information regarding Range 36A.

Comment 17: Page 52, second paragraph. Please show BRA areas in the impact area sampled for chemical contamination on a map/plate.

Response 17: An additional plate will be provided to the report showing the areas of the Impact Area that were sampled. The plate will also show areas where site walks were completed.

Comment 18: Page 82, Section 3.6.3. Need more information on area of coverage. Map/plate?

Response 18: Please see Response to Comment 17. A plate will be prepared showing the areas where sampling and reconnaissance have been completed.

Comment 19: Page 85, last paragraph, reference to Attachment A. Where is this attachment? Did the Army mean to reference Appendix B?

Response 19: The data were going to be provided as Attachment A following final QC; however, they are now provided as Table B12 to avoid providing the same information in two locations.

Comment 20: Pages 93 and 99 – typo – delete extra period: “from E to A..”

Response 20: The text will be revised as suggested.

Comment 21: Page 97, Section 4.2. Update BRA information. Please give more detail on BRA areas in the impact area sampled and evaluated for chemical contamination threats. Note when the document is due to be completed etc.

Also note in this section that threats to groundwater from MEC in impact area not a concern because concentrations not high enough, groundwater is very deep, etc. – just be clear that this pathway was considered.

Response 21: A plate will be prepared that identifies the areas that have been sampled, and will be added to the report. A Feasibility Study for Site 39 is being prepared that will describe the remedial actions anticipated for the site. This document is scheduled for 2007. The threat to groundwater from MEC was considered as part of the 1994 Basewide RI/FS. This is not a concern because groundwater is very deep and sampling indicated that the impacts to soil are generally confined to the top foot.

Comment 22: Page 103, second bullet. Is this statement true for 43-48 so-called special case areas? Please clarify as the report argues that 43-48 is a worst case for MEC in the impact area.

Response 22: It is anticipated that the conditions will be similar in the special case areas; however, because removals to depth have not been completed in the special case areas, the depth distribution in the SCAs cannot be determined. A statement will be added to the text stating that the vertical distribution in the SCA is unknown.

Comment 23: Appendix A – are these SOPs still appropriate for reference as HLA no longer involved. These SOPs are 5 to 6 years old. Please clarify.

Response 23: The SOPs are still being used for addition of data to the GIS. The SOPs will be updated as MACTEC documents.

Comment 24: Appendix B, Again please update as appropriate based upon final TIP data.

Response 24: The Appendix was updated to include the TIP data.

Comment 25: Appendix D, Note that After Action Reports (AARs) are available online or if not all are place an asterisk next to those that are available online. Also please note the Army's Fort Ord cleanup website address.

Response 25: Appendix D will be revised as suggested.

VOLUME 2 OF 2, FEASIBILITY STUDY

Comment 1: Page 1, Section 1.1. Note in the objectives that this document only addresses physical MEC risks.

Response 1: The text will be revised as suggested.

Comment 2: Page 4, first sentence. Should “potentially” be potential?

Response 2: “potentially remaining MEC risks” is the intended terminology.

Comment 3: Page 6, Impact area acres – please clarify per comment RI above. Also show acreage on Plate 2 or another plate if possible. Note in text at bottom of page 6, the acreage for Eucalyptus Fire and the WGB areas.

Response 3: The text will be revised as suggested.

Comment 4: Pages 7-8, Section 2.2, Please just state: “the RAOs for Track 3 are:” This section as written is confusing.

Response 4: The text will be revised as suggested.

Comment 5: Page 11, third paragraph and elsewhere in FS. Instead of using term visual surface clearance, just use surface clearance. The surface clearance should be instrument aided or at least include the option of using an instrument.

Response 5: The surface only removal would include use of a hand held magnetometer or equivalent instrument in areas where the ground surface is not visible such as areas covered with ash. The use of the hand held magnetometer will be added to the description of the surface removal provided in the FS.

Comment 6: Page 13, second paragraph, item (3) containment of MEC. Please explain what is meant here by containment of MEC.

Response 6: Containment of MEC would consist of placement of physical barriers to prevent contact.

Comment 7: Page 13, Section 2.2.2, last sentence, reference to Section 4.5. Section 4.5 doesn’t actually have anything in it. It says look at Table 1. Should you have more discussion in Section 4.5?

Response 7: The text will be revised to provide additional detail and clarify references to potential ARARs that are presented in Table 1.

Comment 8: Page 14, Chemical specific ARARs. Do these even apply if only looking at physical hazards in this RI/FS. Please clarify.

Response 8: The text will be revised to provide additional detail and clarify references to potential ARARs that are presented in Table 1, including the chemical-specific (MEC-specific) ARARs identified in the table.

Comment 9: Page 20-21 (DTSC LUC policy) and 22-24 (deed notices etc) – Please better clarify how applicable to a Fed to Fed transfer and better define the

“Assignment” vehicle. Is there a deed at the time of transfer – how do restrictions run with the land? Also 5-year review – the reviews are every 5 years as long as waste remains on site so not just conducting a 5 year review once within 5 years of the remedy implementation. Also note the next Fort Ord basewide 5 year review is 2007.

Response 9: The text will be revised as suggested to clarify the scope of the Assignment and basewide five-year review schedule.

Comment 10: Page 24, Second paragraph on community involvement – note the Fort Ord web site address after the web site is referenced in the text.

Response 10: The text will be revised as suggested.

Comment 11: Page 24, Local and state Ordinances. Need more here. These would not apply to impact area because Fed to Fed transfer? Or could explain that outer portions of impact area (Seaside, etc.) and MOU will go to municipalities etc and so they would be covered.

Response 11: The text will be revised as suggested to clarify the applicability of local and State ordinances.

Comment 12: Page 26. First bullet and 3.2.1. Again more needed on “assignment”. Who enforces? Another important land use control if go with preferred alternative: No unrestricted reuse.

Response 12: The text will be revised as suggested to clarify the scope of the Assignment and restrictions on reuse.

Comment 13: Page 27, section 3.2.2. If items left below surface as per the preferred alternative, will need escort and construction support.

Response 13: The text will be revised to clarify how each of the stand alone components described are combined in the development of comprehensive remedial alternatives.

Comment 14: Page 28, section 3.2.2, last sentence. Please delete. Can’t be discontinued, as too much MEC will remain in subsurface.

Response 14: The text will be revised to clarify the decision process regarding long term requirements for MEC recognition and safety training.

Comment 15: Page 28-29, section 3.2.3. 5-year review – the reviews are every 5 years as long as waste remains on site. Also, would not expect the cessation of construction monitoring if MEC remains in subsurface – please delete or revise.

Response 15: The text will be revised to clarify the decision process regarding long term requirements for construction monitoring.

Comment 16: Page 29, section 3.2.4, second sentence, “may be” should be “will be” as MEC will remain below surface.

Response 16: The text will be revised to clarify how the range of options described that may be implemented are combined in the development of comprehensive remedial alternatives.

Comment 17: Page 31, third paragraph. Selection of vegetation clearance also depends on type and density of surface and shallow subsurface MEC.

Response 17: The selection of vegetation clearance methods will be driven by the requirement to conduct prescribed burning in Central Maritime Chaparral Habitat. The type and density of surface munitions will be considered, but is not the driver on the method of vegetation clearance suggested.

Comment 18: Page 32, first bullet. Up to 800 acres proposed for burns per year need more detail on basis for this annual acreage amount.

Response 18: Please see Response to Supplemental EPA General Comment 1 that indicates the text will be revised to clarify the basis for the proposed acreage, and that it is anticipated that the prescribed burns will be conducted in stages and that several small burns will be conducted rather than one large burn.

Comment 19: Page 34, first paragraph. Give more details on notification. Also include the language that smoke not good for your health (per earlier fact sheets/reports prepared by the Army for prescribed burns) and ways the community can take precautions to minimize impacts (staying indoors, relocating themselves, etc).

Response 19: The text will be revised as suggested to provide additional information regarding notification.

Comment 20: Page 35, Worker safety and top of page 36 – instead of “suitable distance” use minimum safe distance based upon MEC. Workers would not be harmed if minimum safe distance maintained.

Response 20: The text will be revised as suggested.

Comment 21: Page 38, second paragraph – revise – sentence cites section below which is actually in the paragraph above to emphasize history of successful prescribed burns as discussed in the second paragraph.

Response 21: The text will be revised as suggested.

Comment 22: Page 39, section 3.3.2 – Again – source/basis of 800 acres – please explain.

Response 22 Please see Response to Comment 18 and Supplemental EPA General Comment 1 that indicates the text will be revised to clarify the basis for the proposed acreage, and that it is anticipated that the prescribed burns will be conducted in stages and that several small burns will be conducted rather than one large burn.

Comment 23: Page 40, section 3.3.2.1.1. Visual surface clearance can include instrumentation.

Response 23: See response to EPA Supplemental Comments, Volume 2 of 2, Feasibility Study, Comment 5.

Comment 24: Page 44, section 3.3.2.3. Digital Mapping – please better explain purpose of this mapping and how it is of benefit to future users.

Response 24: The text will be revised as suggested to provide additional details regarding the purpose and benefits of digital mapping.

Comment 25: Page 46-47, section 4.1. Should this be in Section 4.0? If yes then why is it included the first section of the development of alternatives discussion? Also – again need more information if possible on “Assignment.”. Also, 5-year review – per CERCLA, 5 year reviews continue as long as waste remains on site.

Response 25: The description of Long Term Management Measures Specific to the Impact Area MRA in Section 4.1 is specific to the site and is a component included in the development of remedial alternatives discussed in Section 4.0. The text will be revised as suggested to provide additional details regarding the Assignment and 5 year review process.

Comment 26: Page 48, second bullet – basis for 800 acres?

Response 26: Please see Response to Comment 18 and Supplemental EPA General Comment 1 that indicates the text will be revised to clarify the basis for the proposed acreage, and that it is anticipated that the prescribed burns will be conducted in stages and that several small burns will be conducted rather than one large burn.

Comment 27: Page 50, fuel breaks. Should remedial alternatives include 150 foot wide fuel breaks as were developed for MRS-16?

Response 27: Please see Response to Supplemental EPA General Comment 1 that indicates the text will be revised to provide additional details regarding the implementation plan that will describe the proposed widths of MEC removals on temporary fuel breaks.

Comment 28: Pages 50-56, For FS alternatives (2 and 4 and maybe even 3 if SCAs) where MEC is left in place in the subsurface, there should be a prohibition on unrestricted uses such as residential.

Response 28: Please see Response to Supplemental EPA General Comment 8.

Comment 29: Page 52, section 4.4.3, Alternative 3. Explain that just as at 43-48, there may be SCAs that due to high density and MEC hazard, cannot be excavated. This will help explain, in addition to cost, why Alternative 3 is not preferred.

Response 29: The text will be revised as suggested, and include a discussion of potential ecological impacts.

Comment 30: Page 53, Section 4.4.4, Alternative 4. Regarding the up to 10% additional MEC clearance to depth – does this include existing roads and trails? The 10% would be approximately 656 acres of the 6560 total impact area acreage. Please note in the text of this section the total acreage of the existing roads and trails. Also may want to mention a buffer clearance and thus increase the percentage to include buffer acreage, perhaps 100 feet along inside of perimeter fence where it is adjacent to residential areas.

Response 30: The text will be revised to clarify the types of areas within the Impact Area MRA where MEC removal to depth would be implemented under Alternative 4.

Comment 31: Page 55, bullets. Add bullet(s) to address possible buffer clearance and possible removal of HE, highly dangerous shallow subsurface MEC items as appropriate.

Response 31: Please see response to EPA Supplemental General Comments 2 and 6. The text will be revised to include removal to depth within a 100 foot wide buffer adjacent to development areas and to describe the BCT review process that could result in the subsurface removal in areas such as those containing highly dangerous shallow subsurface MEC items, as appropriate.

Comment 32: Page 56, Section 4.5 and Table 1. See comment 7 above. Also are BLMs policies To Be Considered (TBC) that should be noted and discussed? Are the state's land use control policies also TBCs?

Response 32: The text will be revised to provide additional detail and clarify references to potential TBCs and potential ARARs that are presented in Table 1.

Comment 33: Page 57- 83, Section 5 and Section 6, Evaluation and comparison of Alternatives and Preferred Alternative. See general comments above

particularly general comment 9. Preferred alternative should include a prohibition on unrestricted reuse.

Response 33: The text will be revised to include the prohibition on unrestricted uses such as residential. Please see response to Supplemental EPA General Comments 8 and 9.

Comment 34: Page 84, Section 7. Should this be renamed Track 3 RI/FS Next Steps?

Response 34: The section title is consistent with EPA's *Guidance for Conducting Remedial Investigation/Feasibility Studies Under CERCLA*.

Comment 35: Appendix A, Tables. Please include the Alternative number in the titles. Also need more information on cost assumptions as the costs for Alternatives 3 and 4 seem too high even for estimates and given the +50/-30 allowed for FS cost estimates under CERCLA.

Response 35: The titles will be revised as suggested, and additional details will be provided to clarify cost assumptions.

Department of Toxic Substances Control
Letter dated October 31, 2006
COMMENTS

Comment 1: The document uses data from prior removal actions conducted mostly outside the Impact Area boundary. The Ranges 43-48 Interim Action Munitions Response data is extensive, but the data have not been validated by Quality Assurance. A large portion of acreage located within the Impact Area does not have adequate data collected or the data was collected without the benefit of Data Quality Objectives being in place at the time. The Impact Area has many unknowns regarding the density and location of Munitions and Explosives of Concern (MEC) that must be fully evaluated. The Feasibility study should not be based on data that do not give an accurate representation of the entire site.

Response 1: The Army acknowledges that the available characterization data is limited to surface removals over a portion of the site, subsurface removal actions primarily on roads and trails, and site walks conducted as part of the basewide range assessment; however the Army maintains that there is sufficient data to prepare a risk assessment using the Fort Ord Risk Protocol and to prepare a feasibility study for removal of MEC.

Much of the subsurface data was gathered during fuel break and roads and trails removal actions. The fuel breaks cross east west and north south and are similar to running transects across the site. The fuel break data in conjunction with the surface removal data, historical records, and basewide range assessment data do provide data from across the Impact Area and indicate that MEC is present throughout the Impact Area. Based on the constraints of the HMP it is not feasible to collect additional characterization data to further refine characterization areas. Much of the Impact Area not previously visited, sampled, or cleared is within thick maritime chaparral which would require burning to access. Once burned, the area could not be burned again to facilitate removal for more than a decade. This would greatly impact the ability to complete a timely characterization or removal action.

To address concerns raised on the characterization of the site, the report will be revised to better represent the current conceptual site model and the probable distribution of MEC based on historical documentation and sampling and surface and subsurface removals conducted within the Impact Area. In addition, the historical sampling, removal actions and site walks will be illustrated on additional plates.

Comment 2: DTSC recommends that the Impact Area be divided into operable units of a more manageable size. The “plug-in” concept may be appropriate, in this case. One possibility would be to use the existing defensible polygons as area

boundaries. Once the first of these areas is surface cleared, then the evaluation of that area can occur. The MEC found on the surface should guide the additional investigation and cleanup work. The cleanup work should be based upon the amount of MEC found, proximity to popular trails and population, the explosive hazard of the MEC items, etc. Characterization of each area in this manner will provide more meaningful data versus a generalized assumption of unknowns based on incomplete data. The BCT can learn from each subsequent area investigated and cleaned up. The intensity of the investigation and cleanup can be modified as the areas are addressed.

Response 2: The response actions will be conducted in stages as described in the FS. A site specific implementation work plan will be developed for each phase of work. The plan will describe the anticipated distribution of MEC, the vegetation clearance plan, and the method for completion of the response. It is anticipated that following the surface removal, the digital geophysical scan will be completed and the data will be presented to the BCT. The BCT will review the data and determine if additional actions (subsurface removal) are necessary. The review will include an evaluation of whether additional actions are consistent with the ARARs including the HMP and Biological Opinions. The text of the FS will be revised to include additional information on this proposed approach. A Technical Memorandum will be prepared documenting the decision reached in the BCT. To avoid impacts to the rare, threatened and endangered species seed bank, completion of the TM will need to be expedited to allow any additional actions to be executed before the next growing season. Additional details on the BCT review step will be added to the FS. In general, factors that would be considered when determining whether additional action, such as subsurface removal are required, include, but are not limited to:

- Type of MEC encountered and danger associated with the MEC
- Proximity to potential receptors
- Density of items
- Consistency with ARARs.

The text of the FS will be revised to include additional information on this proposed approach.

Comment 3: The document states that the Army will clear MEC to depth in a 200 foot “buffer zone” around each defensible polygon. DTSC’s position is that the width of this “buffer zone” may not be adequate to be protective of proposed nearby development, including residential. Please provide more information regarding how proposed residential and commercial development will be protected during prescribed burns and Munitions Removal actions.

Response 3: It is anticipated that temporary fuel breaks will be cut and surface cleared around each burn area prior to burning. This could include cutting a wider fuel break

along the development boundary prior to conducting the burn. In addition, safety set back distances will be identified that will protect the public during vegetation clearance activities. The details of these measures will be documented in the Implementation Work Plan. In addition, the Army proposes a removal to depth in a 100 foot wide zone adjacent to development areas to reduce the potential impacts of wildfires on the surrounding area.

Comment 4: In its preferred remedy, the Army proposes to provide a surface clearance and limited (10 percent) clearance to depth for most of the Impact Area. Because these cleared areas will be subject to erosion and other soil moving forces, frequent “operation and maintenance”, in the form of additional surface clearance, will be needed. If the areas are cleared to depth, this additional surface clearance will not be needed. Please include this analysis in the Feasibility Study.

Response 4: The description and estimated costs for Alternative 2 in the FS will be revised to include a post-removal erosion survey and monitoring for each area. The initial survey within 1 year of MEC removal would be performed to identify areas where erosion may be occurring and MEC may be present at the surface. Follow up monitoring would be conducted yearly until the vegetation grows backs. Any areas where erosion and/or MEC were identified would then be placed in a monitoring program and additional surface removal would be conducted as appropriate.

Comment 5: The conceptual Site Model assumptions are based on limited sampling and transect surveys in the Impact Area. We question whether there is enough information to construct the Conceptual Site Model.

Response 5: The conceptual site models presented in the RI/FS are based on the existing historical information (maps, aerial photographs, reports, and range SOPs) and the surface and subsurface removals completed within and adjacent to the site boundaries. The Army maintains that this is sufficient information to construct a CSM. The CSM may be refined as new information becomes available from remedy implementation.

Comment 6: Volume 2, Feasibility Study, Pages 19-21. Please revise the first sentence in the last partial paragraph to read: “...Section 1472, which allows an owner of...”

Response 6: The text will be revised as suggested.

Comment 7: Please revise the first sentence in the first full paragraph on page 20 to read: “These regulations specify that a Land Use Covenant....”

Response 7: The text will be revised to be consistent with the regulations.

Comment 8: Please revise the last partial paragraph on page 20 to read: “For sites requiring land use covenants, DTSC policy and Title 22, Division 4.5, Chapter 39, Section 67391.1 require that the property owner....”

Response 8: The text will be revised to be consistent with the regulations.

Comment 9: Please revise the last paragraph on page 21 to read: “...would be described in further detail in the Record of Decision and in the Land Use Control....”

Response 9: The text will be revised as suggested.

Comment 10: Please add a final sentence to last paragraph on page 21: “The Army intends that this will comply with Title 22, Division 4.5, Chapter 39, Section 67391.1(e)(2).”

Response 10: The text will be revised as suggested.

Comment 11: Special Case Areas (SCAs) and Pending Areas in the Impact Area have not been fully evaluated. The Interim Action Munitions removal at Ranges 43-48 identified approximately 264 acres of SCAs and Pending Areas. The Army states that Ranges 43-48 can be assumed to be the worst case example of what might be in the Impact Area, so it is realistic to assume that other areas within the Impact Area will also be designated as Special Case or Pending Area. How will the Army address SCAs?

Response 11: It is possible that additional areas of high anomaly density will be identified within the Impact Area. As described in response to EPA Comments 1 and 2 and DTSC Comment 2, a process will be developed to evaluate areas after the surface removal is completed to determine whether additional removals are required. High density areas identified in the future would be addressed through this process.

Comment 12: The current fence and signage is a deterrent that cannot be considered adequate to protect the community. The Army states that the fences and signs will be maintained in addition to security patrols. Given that significant additional human population will move to the developments adjacent to the Impact Area, additional site security measures (enhanced fencing, patrols, etc.) will likely be needed. Please elaborate on how these security measures will be enhanced.

Response 12: Site security will continue as an Army function until the property is transferred. The site security program is updated as necessary to reflect any additional security measures that may be needed in the future to ensure the safety of nearby populations. At the time the property is transferred or reassigned, it is expected that a site security plan will also be prepared by the property recipient and that the

agencies will have an opportunity to review and comment on the plan. The text will be revised to indicate that the site security plan will be modified as necessary due to changes in the nearby human populations.

Comment 13: Volume 2, Feasibility Study, Section 3.3.1, Vegetation Clearance via Prescribed Burning. The Army lists additional vegetation clearance activities that have been studied or require further study, such as Crush and Burn; however, for the purposes of this Feasibility Study the Army assumes that prescribed burning will be implemented using a phased approach of burns and MEC removal of up to 800 acres per year of the 6,560 acre Impact Area. Each prescribed burn would not exceed 400 acres with a minimum of 25 acres of separation. Previous discussing in BCT and SMART meetings, following the 2003 prescribed burn at Ranges 43-48, have focused on conducting more frequent smaller (100 acres or less) burns per year. Please explain the rationale for the increase in acreage.

Response 13: Please see response to Supplemental EPA Comment 1.

Comment 14: Volume 2, Feasibility Study, Section 3.3.2.1.2 Removal to Depth and Section 3.3.2.3 Digital Mapping of Anomalies. Section 3.3.2.3 states that a digital geophysical survey will be provided to the future recipient, yet Section 3.3.2.1.2 states that a digital geophysical survey may not be conducted due to site conditions and difficult terrain features that would prevent equipment use. Please discuss how will these areas be addressed in the future to support reuse, since MEC can be expected in shallow soils below the surface?

Response 14: The text will be revised as suggested to clarify that any areas where a digital survey can not be conducted will be noted in the record provided for planning purposes for future reuses, and additional long term management measures will be evaluated for the area.

**Human and Ecological Risk Division
(Department of Toxic Substances Control)
Letter dated October 31, 2006
COMMENTS**

GENERAL COMMENTS

Comment 1: Relationship to evaluation of munitions constituents.

- A. A major source of confusion in the document is precisely what areas are covered (General Comment 2) and how these areas relate to areas evaluated for munitions constituents. For the most part, this document refers only to the “*Track 3 Impact Area*”. Section 4.2 does mention “*the impact area (Site 39)*”. The relationship between “*Track 3 Impact Area*” and “*Site 39*” should be explicitly stated.
- B. Human health risk assessment for chemical toxicity is discussed in Section 4.2. This apparently includes both munitions constituents (chemicals directly related to munitions) and other contaminants. Curiously, the Department of Defense term “*munitions constituents*” doesn’t appear in the text.
- C. The discussion of human health risk assessment for chemical toxicity (Section 4.2) refers to the Basewide Range Assessment program, the Basewide Remedial Investigation/Feasibility Study and the ensuing Record of Decision. The text should explicitly state what portions of the impact area were covered in these documents.
- D. The text in Section 4.2 begins with the statement that “*The potential for risk to human receptors from the exposure to chemicals associated with MEC is being addressed as part of the Basewide Range Assessment program (BRA).*” Presumably, the present tense verb refers to the additional sampling that was done when the reuse plan was changed. According to the last paragraph in Section 4.2, “*The results of this sampling are being evaluated under the BRA.*” The status of the human health risk assessment for chemical toxicity should be explicitly stated.
- E. We describe deficiencies in the Conceptual Site Model in General Comment 7. The Conceptual Site Model for MEC should be very similar to that prepared for the human health risk assessment.
- F. Ecological risk assessment for chemical toxicity is discussed in Section 4.3. The text states that evaluation “*will continue*” under the Basewide Range

Assessment program for Ranges 33, 36, 43, 45, and 48. This suggests that ecological risk assessment is ongoing for these ranges.

- Response 1: Relationship to evaluation of munitions constituents.
- A. The report will be revised to more clearly define the area that is being evaluated as part of the RI/FS. The relationship between Site 39 and the Track 3 Impact Area will be explained in the text.
 - B. Munitions constituents are defined on page 1 of the document. The text in Section 4.2 will be revised to clearly identify that the chemical hazards consist of both munitions constituents and other chemicals such as TPH.
 - C. The BRA includes all of the historic Impact Area as well as areas outside the historic Impact Area that were, or were potentially, used for military munitions training (e.g., Parker Flats). A plate has been added to the report showing the site walk and locations of samples collected within the Impact Area.
 - D. The text will be revised to state that “The results of this sampling are being evaluated under the BRA to determine if any changes to the cleanup goals presented in the Basewide RI/FS and Basewide ROD (Army 1997) are necessary. The primary focus of the BRA for areas within the Impact Area is to further characterize the extent of explosive compound and lead contamination related to military training and to collect data for assessment of the risk to ecological receptors from munitions constituents.”
 - E. The Conceptual Site Model will be modified to include additional information that was provided in the BRA. It is expected that there will be differences in the Conceptual Site Model for the physical hazards associated with MEC based on the exposure pathway differences between MEC exposure and munitions constituent exposures.
 - F. The ecological risk assessments for ranges within the Impact Area including Ranges 33, 36, 43, 44, and 48 are ongoing. Additional soil samples are still being collected. Revision 1C to the Comprehensive Basewide Range Assessment includes additional sample results and was recently released for review. Soil values for metals and explosive constituents protective of ecological receptors throughout the Impact Area are being developed in the Site 39 Feasibility Study Addendum.

Comment 2: Descriptions of the Subject Areas.

- A. **This report only addresses part of the Impact Area. Although the description in Section 1.0 references Plate 2, it is difficult to understand which portions are included and which are excluded.**

- B. The text in Section 1.0 states that the portion of the Impact Area addressed in this report is the “*Habitat Reserve in the Installation-Wide Multispecies Habitat Management Plan (HMP)* (Plate 2)”. In spite of this specific reference in the text, neither the *Habitat Reserve in the Installation-Wide Multispecies Habitat Management* nor “HMP” is shown on Plate 2
- C. The text in Section 1.0 states that MRS-SEA.1 through MRS-SEA.4, MRS-DRO.1 and DRO.2, MRS-MOCO 1 and 2, MRS-46, MRS-47, and a list of other areas are excluded from this report. Plate 2 has an area labeled “MRS-15 SEA 01”, which may or may not be the same as “MRS-SEA.1”. Similarly, “MRS-15 SEA 04” may or may not be the same as “MRS-SEA.4”. None of the designations we checked in the text in Section 1.0 correspond to the designations in Plate 2.
- D. The text in Section 1.0 states that “*The area does include the Eucalyptus Fire and Watkins Gate burn Area (Plate 2).*” We assume that this means that the Eucalyptus Fire Area and the Watkins Gate Burn Area are addressed in the report. This should be clarified. Also, the legend for Plate 2 indicates both areas in the same color, so that the reader cannot tell which is which. The two areas are distinguished in Plate 5.
- E. The legends for Plate 2 and other plates indicate “*Fuel Breaks*”, but they don’t appear on the map itself. The term “*Fuel Breaks*” is also used in Section 2.3.2. Please provide a definition and please locate the “*Fuel Breaks*” on Plate 2.
- F. The locations of the firing ranges are discussed in Section 2.2.1 with a reference to Plate 2. Ninety-nine firing ranges are listed in Tables 3.1 and 3.2. Plate 2 shows the location of one firing range (Range 30A).

Response 2: Descriptions of the Subject Areas.

- A. Plate 2 will be modified and shading will be added to highlight the portions of the Impact Area included in this RI/FS. This RI/FS only includes the portion of the Impact Area currently identified for transfer to BLM.
- B. The HMP is the habitat management plan. The plan identifies areas designated as habitat reserve within the boundaries of the former Fort Ord. A note will be added to Plate 2 indicating that the shaded area is a habitat reserve area identified in the HMP and that the area is currently identified for transfer to BLM.
- C. The naming conventions for sites have undergone modification during the past year. The text and plates will be modified to use the same site naming conventions.

- D. The text will be modified to clarify that the Eucalyptus Fire Area and Watkins Gate Burn Area are included in the Impact Area MRA. Plate 2 will be modified to show a different color or pattern for each of the burned areas.
- E. Section 2.3.2 will be modified to provide a definition of fuel breaks including both permanent maintained fuel breaks and temporary fuel breaks that may be created prior to prescribed burns. The permanent fuel breaks are shown on Plate 2, but the color is difficult to distinguish. A different color will be used for the fuel breaks so they stand out. A definition of the fuel breaks will be provided in the text.
- F. The reference will be changed to Plates 3 and 4 that show the historical ranges.

Comment 3: Abbreviations.

- A. **Little is gained and much comprehension is lost by the unrelenting use of abbreviations. For example, one single sentence in Section 1.2.1 includes “RI”, “MR”, “AARs”, “TIPs”, “ASRs” and “ODDS”.**
- B. **This overuse of abbreviations is exacerbated by inconsistencies. For example, a particular area is referred to as “MRS-SEA.1” in Section 1.0, as “MRS-SEA.01” in Section 3.1, and as “MRS-15 SEA 01” in Plate 2. See also General Comment 2, C.**

Response 3: Abbreviations

- A. The abbreviations are defined upon first use and an acronyms list is provided in the document. Most of the abbreviations are related to program titles and report types. The use of abbreviations will continue.
- B. Please see response to Comment 2C. The site names will be made consistent between the text, tables, and plates.

Comment 4: Site Characterization.

- A. **The report (Section 4.1.1) lists four areas where surface removal was carried out. These areas consisted of 1,005 acres in the Watkins Gate Burn area, 367 acres in the Eucalyptus Fire Area, 295 acres in the fuel breaks and roads and trails, and 499 acres in Ranges 43 through 48, for a total of 2,166 acres. This is only 33% of the total impact area (6,560 acres, as reported in Section 3.1).**
- B. **The report (Section 4.1.1) lists two areas where subsurface removal was carried out. These areas consisted of 133 acres in the fuel breaks and roads**

and trails and 272 acres in Ranges 43 through 48, for a total of 405 acres. This is 6% of the total impact area (6,560 acres).

- C. However, the report (Section 4.1.1) states that “*It should be noted that only a portion of MRS-Range 43 through 48 is included with the Track 3 Impact Area MR RI/FS boundaries and that most of the subsurface removal occurred outside of the area addressed in the RI/FS (Plate 2).*” Thus, it appears that most of the impact area has not been characterized at all with respect to subsurface MEC.**
- D. The discussion of uncertainty (Section 4.1.5) states that “*The data used in performing this risk assessment may not represent all areas of the Impact Area MRS [EMPHASIS ADDED] as noted above.*” This is a startling understatement.**
- E. The report states that the Base Realignment and Closure Cleanup Team (BCT) decided that “*...the full removal data set from Ranges 43 through 48 could be used for this risk assessment...*” Please clarify precisely what the BCT recommended, what the BCT’s rationale was, and provide a reference to document the BCT decisions.**

Response 4: A. Comment noted.

B. Comment noted.

- C. The roads and trails transect through most of the Impact Area and can be interpreted to represent the areas between the roads. In addition, the historical information (training maps, aerial photographs, and SOPs) when compared to the existing data indicates that for munitions used after World War II are found within the range fans where the items were authorized for use. Please see Response to DTSC Comment 2 which outlines a procedure for presenting additional data to the BCT following surface removal and digital geophysical mapping.
- D. The Army agrees that the Ranges 43 through 48 data set does not represent all areas of the Impact Area; however, as stated in the report, the density of high explosives within Ranges 43 through 48 is expected to be one of, if not the highest, in the historical Impact Area, based on the historical usage of the ranges and observations by UXO Safety Specialists working within the Impact Area. Because, as noted in comments A and B, the data set for the area within the Track 3 Impact Area MRA boundaries is limited, the Ranges 43 through 48 data set was used to perform the risk assessment. Additional detail will be added to the text to better explain the statement referenced above.

- E. The use of the Ranges 43 through 48 data set for the risk assessment was discussed at an August 30th 2005 Technical Approach meeting attended by the Army, EPA, and DTSC. At the meeting the rationale for using the Ranges 43 through 48 data set was discussed. The rationale was that the Ranges 43 through 48 area represent a high density area and that running a separate risk assessment for lower density areas, small arms training areas on the outer edges of the Impact Area and areas between range fans) within the Impact Area was not necessary because the results would not vary (The risk would still be an E based on the presence of some Type 3 items). Other areas within the Impact Area have the same risk type items and the density would not vary enough to change the score.

Comment 5: Data Quality.

- A. The ***“Data Usability”*** discussion in Section 3.3.3 concludes that ***“Based on the QA/QC procedures described above and a review of the after action reports associated with the activities performed within the Impact Area MRS, the existing Impact Area MRS data are of sufficient quality for use in the risk assessment and feasibility study.”*** This appears to include the data from the Ranges 43 through 48 Interim Action.
- B. The ***“Data Usability”*** discussion in Section 5.1.2 in the ***“Conclusions and Recommendations”*** section (5.) consists of one sentence, almost identical to that quoted above from Section 3.3.3. One curious difference is that Section 3.3.3 states that the data are appropriate for the risk assessment and feasibility study, while Section 5.1.2 states that the data are appropriate for the risk assessment and the remedial investigation.
- C. The ***“Data Usability”*** discussion in Section 4.1.1 states that all data in the Military Munitions Response Program database have gone through Quality Control/Quality Assurance (QC/QA) but that the data from Ranges 43 through 48 Interim Action are excluded from the database because they have not yet been evaluated. This appears to directly contradict the statements in both Sections 3.3.3 and 5.1.2. Please make the appropriate corrections.
- D. Please clarify the status of the data used in the risk assessment with respect to QC/QA.
- E. The text in Section 4.1.1 suggests that ***“Although it is possible that some data may need correction during the upcoming data QC/QA process, it is anticipated that the updates would not result in significant changes that could alter the input factors used in the risk assessment.”*** Please provide a rationale to justify this suggestion in both Sections 4.1.1 and 4.1.5.1.

- F. Data quality Objectives (DQOs) are not mentioned in Section 4.1.1, but Section 3.3.4 references DQOs for the Basewide Range Assessment and for the site reconnaissance phase of the current Munitions Response site investigation program. Please state explicitly whether DQOs were developed for the data used in the risk assessments in this report. If they were not, please discuss the implications.**
- G. Please state explicitly whether the BCT has evaluated the QC/QA. If it has, please summarize its conclusions and provide a reference to document the BCT decisions.**

Response 5: Data Quality

- A. This section includes a description of the Ranges 43 through 48 QC/QA procedures, and the data usability statement includes use of the Ranges 43 through 48 data.
- B. The text will be revised to state in both sections that the data are appropriate for preparing the Remedial Investigation, Risk Assessment, and Feasibility Study.
- C. The QC and QA for the Ranges 43-through -48 data set have been completed. The QC/QA section will be updated to reflect the most current information.
- D. Please see Response to Comment 5C. The text will be updated to reflect the most current QC/QA status.
- E. The Ranges 43 through 48 data set has completed the QC process and QA of previous data sets has not resulted in significant changes to the data set. Most of the changes to historical data sets have occurred during the QC process. The report will be updated to include the most current data set. The status of the QC/QA process will be documented in the next version of the RI/FS.
- F. Specific DQO sections were not provided in the work plans for the Munitions Response activities completed within the Impact Area; however the work plans do document quality control requirements and contractual requirements. The QA/QC and contractual requirements fulfill the same purpose as DQO sections in HTW work plans.
- G. The BCT has reviewed the After Action Reports, Technical Information Papers, and Technical Memoranda associated with data collected within the Impact Area MRA.

Comment 6: Conservatism:

- A. The report repeatedly characterizes the risk assessment for MEC as “conservative”. This characterization appears no less than four times in Section 4.1.1 alone. The assertion also appears in Section 4.1.5.1 and in the first bullet in the conclusions section. The characterization as “conservative” appears to be unwarranted.
- B. The premise of the assertion of “*conservatism*” is that the risk assessment was based on the types and densities of MEC removed from Ranges 43 through 48 and the assumption that these ranges are the most impacted. There are several problems with this premise.
 - (1) The portions of Ranges 43 through 48 from which MEC were removed lie mostly outside the Impact Area (General Comment 4C). Therefore, use of these data is neither “*conservative*” nor “*liberal*”. It appears to be mostly irrelevant.
 - (2) Even if these data were relevant to the Impact Area, it is not “*conservative*” to apply them across a large area. The use of data from one area to characterize a different area is not “*conservative*”. It is misleading and could well underestimate risks.
 - (3) The text in Section 4.1.1 states that “*It is suspected, based on historical information, that MRS-Ranges 43 through 48 may represent one of the highest MEC density areas within the Impact Area.*” The text in Section 4.1.5.1 has been changed to the bolder statement that “*The MRS-Ranges 43 through 48 dataset most likely represents one of the highest MEC density areas present within the historical Impact Area based on the length of use (from at least 1945 through base closure), and the type so military munitions that were used (mostly HE).*” Finally, the first bullet in the Conclusions section states that “*The use of this data is considered conservative because it is expected that areas between range fans will have lower MEC densities than were present within MRS-Ranges 43 through 48.*” Thus, the careful statement that “*It is SUSPECTED, BASED ON HISTORICAL INFORMATION [EMPHASIS ADDED].*”, that “*...MRS-Ranges 43 through 48 MAY [EMPHASIS ADDED].represent ONE OF THE HIGHEST [EMPHASIS ADDED].MEC density areas within the Impact Area.*” has evolved throughout the report to be replaced with an overreaching conclusion. The word “*suspected*” has become “*most likely*” or “*expected*” and the verb “*may*” has become “*will*”. Furthermore, instead of characterizing Ranges 43 through 48 as “*one of the highest MEC density areas*”, the conclusion implies that Ranges 43 through 48 will have the highest MEC density of any area.

(4) Please revise the report to identify the considerable uncertainties with what has been done. Please provide a consistent and defensible description of the data for Ranges 43 through 48.

Response 6: Conservatism

- A. The Army believes the description of the assumptions used in the Risk Assessment Protocol, and the basis for each factor considered that are described in the Risk Assessment sections of the report are conservative.
- B1. MRS-Ranges 43 through 48 is within the historical Impact Area. The majority of MRS-Ranges 43 through 48 are not included in this RI/FS because portions are not being transferred to BLM, and this RI/FS only includes the portions of the historical Impact Area that are proposed for transfer to BLM as habitat reserve. The text will be revised to clarify that Ranges 43 through 48 are within the boundaries of the historical Impact Area and that based on review of historical information and data collected within the Impact Area the area does represent one of the highest use areas.
- B2. The Army believes the risks calculated throughout the rest of the Impact Area based on the Ranges 43 through 48 data would potentially overestimate risk.
- B3. The text will be revised to use consistent terminology throughout the report.
- B4. Please see Responses to Comments B2 and B3 above.

Comment 7: Conceptual Site Model.

- A. The text (Section 3.6) discusses the Conceptual Site Model. It references Plate 15 as presenting “...a conceptual site model showing previous use and proposed reuse of the Impact Area.” Neither the text in Section 3.6 nor Plate 15 presents a complete Conceptual Site Model. Plate 15 provides useful information about past use and proposed future use, but is insufficient as a Conceptual Site Model. The text discusses planned reuse, human receptors, and “*Potential Human Exposure Routes*” for physical hazards and for chemical hazards.
- B. We strongly recommend U.S. EPA literature, such as www.epa.gov/superfund/resources/soil/attacha.pdf for the elements of a complete Conceptual Site Model.
- C. We recommend that the authors of this report coordinate with the authors of the Conceptual Site Model for the chemical risk assessment in the Basewide Range Assessment Report. The Conceptual Site Models in the two reports should be consistent.

- D. In risk assessment, ***“Potential Human Exposure Routes”*** are the ways in which chemicals enter the human body (U.S. EPA, 1989). These routes are through ingestion, inhalation or dermal contact. What is intended in Section 3.6 is ***“Potential Human Exposure Pathways”***. An exposure pathway is the way that a chemical moves from its point of release to a receptor (U.S. EPA, 1981). In this case (Section 3.6), an exposure pathway is the way in which a receptor comes into contact with a MEC item.

- Response 7:
- A. Additional information will be added to the text to present a more detailed conceptual site model. The sections will be reorganized to clearly indicate that all of the required sections are present.
 - B. The provided reference was reviewed. Most of the information is related to developing conceptual site models for potential chemical releases associated with HTW sites.
 - C. The conceptual site models in the BRA will be reviewed and the conceptual site model provided in this document will be updated as necessary.
 - D. The heading of Section 3.6.2 will be revised to “Potential Human Exposure Pathways – Physical Hazards”.

Comment 8: Future Land Use.

- A. The text (Section 2.2.3.3) states that ***“The SUMP identified three unique future reuse designations with the Impact Area MRA. These designations include unrestricted/BLM areas, limited-access areas, and restricted/administration areas.”*** The text then lists four anticipated future reuse designations, which are the three previously listed plus ***“Unrestricted”***. The unrestricted designation includes ***“Urban development, recreation development, and transportation”***. Please clarify: (1) whether there are three or four designations for the BLM Site Use Management Plan and what the designations are, and (2) how there can be ***“Urban development”*** on BLM land.
- B. The text (Section 2.2.3.3) also states that ***“A general goal of the HMP is to promote preservation, enhancement, and restoration of habitat and populations of HMP species while allowing development on selected properties on the former Fort Ord, which promotes economic recovery after base closure. Parcels designated for development are intended for economic recovery and have no restrictions in terms of habitat management.”*** Please clarify this apparent contradiction. We do not understand how the general goal of promoting ***“Preservation, enhancement, and restoration of habitat and populations of HMP species”*** can be consistent with allowing ***“development***

on selected” and with having “no restrictions in terms of habitat management”.

C. In contrast to Section 2.2.3.3, the Conceptual Site Model discussion (Section 3.6.1) lists six categories of planned reuse. The diagram of “Reuses after Property Transfer” (Plate 15) shows a small arms range and a “Military Operations in Urban Terrain (MOUT)”. Neither of these is mentioned in Section 2.2.3.3 or Section 3.6.1.

D. Please clarify the planned reuses and ensure that the report is internally consistent.

- Response 8:
- A. There are only three designations. The text will be revised to eliminate the reference to urban development.
 - B. The referenced sentence was copied from the HMP. The HMP is designed to accommodate disposal and reuse of property by defining development areas where loss of species and habitat is allowed. Those losses are offset by requiring habitat conservation measures in other areas and designating large areas as habitat reserve. The successful management of habitat reserve is essential for economic recovery through development of designated parts of the former Fort Ord.
 - C. The MOUT and the small arms range are not part of the Impact Area MRA and were not included in the discussion of proposed reuses within the MRA. Plate 15 will be modified to indicate that these parcels are not part of the Impact Area MRA.
 - D. The report will be modified to ensure that the descriptions of the planned reuses are consistent throughout the report.

Comment 9: Receptors.

- A. **The report (Sections 3.6.2 and 4.1.2) lists five groups of receptors. Two of these groups (trespassers and construction workers) are actually receptor groups. The other three groups are “surface only receptors, shallow intruding receptors, deeper intruding receptors”. These categories by intrusion depth are inconsistent with general risk assessment practice and inconsistent with Appendix E of the Fort Ord Ordnance and Explosives Risk Assessment Protocol (Malcolm Pirnie, 2002). The report provides no rationale for this unorthodox approach.**
- B. **One problem with the approach is that the categories are overlapping. The trespasser is also a shallow intruding receptor. The construction worker is also a deeper intruding receptor.**

- C. **The first paragraph in Section 3.6.2 states that “It is expected that contact with shallow soil would be the most likely exposure route for chemicals within the Impact Area.” This is true for many receptors, but not for construction workers or trench workers.**
- D. **The last paragraph in Section 3.6.2 discusses the construction worker. It asserts that the construction worker is a likely receptor during the initial development of the area, but is unlikely following development. We disagree with this statement. Because land use may change, or buildings may be remodeled, expanded, or replaced, construction will be a concern into the future. Furthermore, the construction worker represents other workers who perform intrusive activities. Trenching for utilities is an example of such activities and such trenching can occur at any time.**
- E. **We recommend that once a complete Conceptual Site Model has been completed, it should be used to identify the appropriate human receptors.**

- Response 9:
- A. Grouping of receptors by intrusion depth was discussed in a conference call on June 26, 2006 with EPA and DTSC. Verbal approval was received by DTSC to group receptors by intrusion depth on June 29, 2006. Because the approach to receptor groupings in this Risk Assessment is different than identified in the protocol, additional text will be added to the document explaining the grouping of receptors.
 - B. The trespasser was identified as a separate receptor group because they are not expected to enter the site as frequently as the other receptors or to intrude as deeply. The construction work intrusion depth is deeper than the deeper intruding receptor (5 feet vs. 3 feet) and was therefore grouped separately from the deeper intruding receptor.
 - C. The construction worker and trench workers would still be in contact with the shallow soil. In addition, based on the sampling results the contamination is present at the highest levels in the top 1 foot.
 - D. The text will be revised to identify the possibility that construction may occur following initial development, but would not be expected to be as intensive as the initial development phase.
 - E. The potential human receptors are identified in Section 3.6.2. This section will be updated based on comments received on the draft report.

Comment 10. Ecological Receptors and MEC.

- A. **The text (Section 4.1) states that “*The explosive risks to plants and animals are not addressed in the risk assessment protocol and are expected to be low. Based on BCT concurrence, the explosive risk to plants and animals are not addressed in this document.*”**
- B. **Please provide an explanation of why the explosive risks to plants and animals are expected to be low.**
- C. **Please provide a reference to document the BCT concurrence with excluding ecological receptors.**
- D. **It is true that the Ford Ord Ordnance and Explosives Risk Assessment Protocol (Malcolm Pirnie, 2002) does not address ecological receptors. However, the Munitions Response Site Prioritization Protocol (Department of Defense, 2005) includes ecological receptors in all three aspects of munitions sites (explosives, chemical warfare agents, chemical toxicity). Please provide a rationale for not evaluating the risks to ecological receptors from explosives at the impact area.**

- Response 10:
- A. The text will be revised to include observational data on why the risks are expected to be low. In addition, a statement will be added to the report indicating that specific studies are not available for use in addressing the potential risk to plants and animals.
 - B. Please see Response to Comment A. Observational data will be provided to support the statement.
 - C. The exclusion of physical risks to ecological receptors was discussed in a scoping meeting with the EPA and DTSC on August 30, 2005. During the meeting it was agreed that physical hazards of MEC are not a concern for ecological receptors.
 - D. As stated above the impacts to ecological receptors from physical hazards are expected to be low. Observational data will be added to the text to support this statement.

Comment 11: After Action Risk Assessment.

- A. **Two after action risk assessments were performed (Section 4.1.4.2), one assuming surface clearance only and the second assuming removal of MEC to depth. It should be explicitly stated that both risk assessments are hypothetical, based on assumed actions and assumed results.**

- B. The risk assessment for subsurface removal assumes (pages 92 and 99) that “nearly all MEC in the zero to one foot bgs is expected to be removed”. The Parker Flats work demonstrated that for some MEC items, this is an inappropriate assumption.**
- C. The risk assessment for subsurface removal assumes 32% detection efficiency for MEC densities deeper than one foot (page 92), based on the Parker Flats work. Please provide a rationale for why Parker Flats data can be applied to the Impact Area.**
- D. The text (Section 4.1.4.2) states that “The use of a ‘6’ for receptors below 1 foot and use of a ‘1’ for MEC below ground surface is based on BCT concurrence for use of this assumption for the Track 2 Parker Flats site.”**
 - (1) Please clarify what is being scored with the “6” and the “1”.**
 - (2) Please provide a reference to document the BCT concurrence with these choices.**
 - (3) Please provide a rationale for extrapolating this decision from the Parker Flats risk assessment to this risk assessment.**

- Response 11:
- A. The text will be revised to state that the after action risk assessments are hypothetical.
 - B. It is anticipated that work completed in the future will be done with the best available technology which could include both analog and digital equipment. This should result in better detection rates than those demonstrated for Parker Flats. The work will be completed according to agency approved work plans that have appropriate DQOs and would therefore receive a “1” for MEC below ground surface and density based on the protocol.
 - C. The detection efficiencies used for Parker Flats were considered conservative because the Parker Flats removal action was completed using a handheld magnetometer whereas it is anticipated that future subsurface removals completed within the Impact Area will be conducted using the Best Available Technology which could include a dual instrument survey and increased QA/QC. Therefore, the Army maintains that the use of the Parker Flats data is conservative. It should be noted that using any number for detection efficiency other than 100 percent would result in the same calculated risk score if type 3 items are included.
 - D1 The 1 is for MEC depth below ground surface for shallow intruding receptors (receptors intruding less than 1 foot) and the 6 is used for MEC depth below

ground surface for deeper intruding receptors (receptors intruding below 1 foot). The text will be modified to make the score selection more clear.

- D2 Discussions were conducted with the BCT on June 26, 2006. Concurrence was received following the discussions.
- D3 The Army believes a conservative approach was used. According to the risk assessment protocol a score of “1” could be used for OE density and depth below ground surface for all intruding receptors based on the risk assessment protocol which states that a “1” is likely to occur when considering alternatives in the feasibility study for OE density and depth below ground surface factors. Use of the “1” will result in a score of A for all intruding receptors in the after action risk assessment (as demonstrated by EPA General Comment 4).

SPECIFIC COMMENTS

Comment 1: Section 1.2. The text states that *“This section describes the elements and the purpose of the Track 3 Impact Area Munitions Response Area (Impact Area MRA) and presents background information on the information that will be included in the MR RI/FS.”* First, *“the elements and purpose”* do not pertain to the area. They pertain to the RI/FS. Second, the *“...background information on the information....”* should be rephrased.

Response 1: The sentence will be revised as follows: “This section describes the elements and the purpose of the Track 3 Impact Area Munitions Response Area (Impact Area MRA) RI/FS.”

Comment 2: Page 23; Impact Area Investigations. The paragraph needs clarification. First, the significance of the second sentence is presumably that none of the sampling was in fact in the Impact Area, since MRS-47 is excluded from the Impact Area. This should be explicitly stated. Second, the last sentence presumably means that the exact locations of the grids are unknown, since the first sentence states that they were located” *...in and around the southeastern portion of the Impact Area MRA.”*

Response 2: The text will be revised as follows. “Review of the HFA After Action Report (HFA, 1994) indicates that 80 grids were established in and around the southeastern portion of the Impact Area MRA. Of the 80 grids established, 3 grids were sampled; however, all of the sampled grids are outside of the Impact Area MRA boundary. The exact locations of the established grids and whether any were established within the Impact Area MRA boundary are unknown.”

Comment 3: Section 3.6.3. The text here and elsewhere refers to the Draft Final Comprehensive Basewide Range Assessment Report. Please add the appropriate reference to the text and to the reference list in Section 6.0.

Response 3: The reference will be added to the text.

Comment 4: Section 4.1.4.2. The text states that a score of “7” was assigned for MEC depth below ground surface for all receptors. As defined in the Fort Ord Ordnance and Explosives Risk Assessment Protocol (Malcolm Pirnie, 2002), this score indicates that there is no MEC on the surface but that there is MEC below the surface. This seems appropriate based on the assumptions. However, the text argues that a score of “1” would be valid for MEC depth below ground surface. As defined in the Fort Ord Protocol, this score requires 100% removal of detected MEC, considering data quality for the sector. Given the questions about DQOs and QA/QC (General Comment 5), this score seems unlikely.

Response 4: According to the Risk Assessment Protocol a score of 1 is likely for MEC depth below ground surface and MEC density when used for an after action risk assessment for a surface removal scenario.

Comment 5: Section 4.3. The text includes a reference to “EPA (1997)”. Please add the appropriate citation to the reference list in Section 6.0.

Response 5: The reference will be added to the text.

CONCLUSIONS

Comment 1: The text should clearly define what areas are included in the assessment and which are not.

Response 1: Plate 2 will be revised to provide a better graphic illustration of the areas included in the Impact Area MRA.

Comment 2: The relationship between the Impact Area and Site 39 should be explicitly stated.

Response 2: The relationship between the Impact Area and Site 39 will be added to the text.

Comment 3: It appears that most of the Impact Area has not been characterized for MEC.

Response 3: Please see Response to DTSC Comment 1 and HERD Comment 4.

Comment 4: The data for MEC used in the risk assessment are not representative of the Impact Area. Therefore the risk assessment results are not representative of the Impact Area.

Response 4: Please see Response to HERD Comment 6. Ranges 43 through 48 are within the historical Impact Area and based on historical information and observational data appear to represent one of the most heavily used areas of the Impact Area. The Army agrees that the Ranges 43 through 48 data do not represent the entire Impact Area, but rather represent one of the highest density areas with regards to high explosive items; therefore the results of the risk assessment would be considered conservative when applied across the Impact Area.

Comment 5: We do not agree with the report that it is “*conservative*” to apply MEC data from one area (MRS-Ranges 43 through 48) to the entire Impact Area. Much of the area of these ranges is outside the Impact Area. The assumption that these ranges are the most problematic with respect to MEC may or may not be correct. Finally, it is simply uninformative to apply data from one area to another.

Response 5: Please see Response to Conclusion Comment 4

Comment 6: The risk assessments suffer from the lack of a complete Conceptual Site Model.

Response 6: The conceptual site model will be revised to include additional information.

Comment 7: The baseline risk assessment concludes that the risk is at level “E” for all receptors. Given the nature of the Impact Area, this, the highest risk level, seems appropriate.

Response 7: Comment noted.

Comment 8: The after action risk assessment, assuming visual surface clearance found that the risk was reduced to medium or “C” for receptors who do not intrude below the surface, while all receptors with intrusive activities remain at the highest risk level or “E”. Similarly, the after action risk assessment which assumed subsurface clearance found that the risk was reduced to lowest or “A” for receptors intruding to less than one foot below the surface or not at all, but remained at highest risk (level “E”) for all receptors who intrude to greater depths.

A. The reduction in risk level from “E” to “A” for receptors intruding to less than one foot below the surface results from the assumption that “*nearly all MEC in the zero to one foot bgs is expected to be removed*”. This assumption is questionable (General Comment 11).

- B. In spite of the considerable uncertainties in these risk assessments, they demonstrate that risks from intrusive activities will remain high after clearance. This is because of the inability to ensure that all MEC has been removed.**

Response 8: Please see response to General Comment 11.

Comment 9: In its present form the risk assessments are not acceptable. We recommend that the approach be reconsidered, beginning with the all important issue of site characterization.

Response 9: As stated above, the Army maintains that there is sufficient characterization to prepare the Remedial Investigation, Risk Assessment, and Feasibility Study. The approach for remediation has been revised to include a second review step following surface removal, so that additional subsurface removal could be considered and implemented if deemed necessary by the BCT.

**United States Department of the Interior
Fish and Wildlife Service
Letter dated November 1, 2006
COMMENTS**

Comment 1: The Service is supportive of prescribed burning as the vegetation clearance technique, as specified in Alternatives 2 through 4. Prescribed burning, as opposed to clearing by other techniques, is essential for the long-term management of listed and sensitive species on Fort Ord because maritime chaparral is a fire-adapted ecological system that regenerates more completely after disturbance by fire than after other physical disturbances that do not utilize fire (like mechanical clearing).

Response 1: Comment noted.

Comment 2: **Environmental Effects Analysis:** The draft document does not sufficiently address the environmental effects of the various alternatives outlined in the Track 3 Remedial Investigation/Feasibility Study (RI/FS). We recommend you include additional analysis of the following potential environmental effects:

(a) The increased difficulty in conducting prescribed burns due to land access limitations where only surface clearance is proposed and/or increased difficulty in responding to non-prescribed burns. For example, the document should describe the changes in fire fighting capabilities that would occur and how this might influence fire prevention or suppression measures, such as fuel break size.

(b) The ways in which long-term plant monitoring, restoration, weed control, and erosion control would be altered where only surface clearance is proposed, including an increased reliance on herbicide for invasive plant control rather than hand removal methods.

Response 2: Prescribed burning can be designed to be surface-activity with appropriate planning. A combination of fire management methods can be applied to manage the risk of wildfires that could occur in the Impact Area, including fuels management and developing an ability to fight fires from the perimeter to protect life and property. The Army is committed to developing a remedial alternative that would support effective management of the area as a habitat reserve, including prescribed burning as a critical component of the management strategy.

The Army acknowledges the concerns related to increased costs associated with planned management activities in areas where removal actions are limited to

surface removal only. However, the Army maintains that habitat management activities can be completed using alternative methods that would likely involve UXO escort and support. The costs of MEC removal and long-term UXO support are presented for a 30 year period in the FS consistent with USEPA Guidance for preparing cost estimates in the FS.

Comment 3: **Cost Analysis:** As we indicated above, the Service is working with numerous entities on the HCP for former Fort Ord. The 6,500 acres of Track 3 MRAs are a substantial part of the conservation strategy identified in that HCP. It is a requirement of all HCPs that they identify the estimated costs of implementing their proposed conservation strategy. Up to this point, the draft HCP for former Fort Ord has anticipated that the 6,500 acres of Track 3 would be transferred to BLM and managed in a manner similar to the lands supporting maritime chaparral that have already been transferred to them. Under an alternative where Munitions and Explosives of Concern (MEC) are left beneath the ground surface, it appears that construction support and escorts would be required for even simple activities, such as the corner-staking of plant monitoring plots. The document should estimate the increased costs of habitat management activities (annually and for the next 100 years) that are likely to be associated with lands that have a surface clearance rather than clearance to depth.

The cost estimates included in the draft RI/FS for implementation of remedial alternatives do not appear to sufficiently address differences in costs between surface clearance only (Alternative 2) versus clearance to depth (alternative 3) or the combination of surface clearance plus clearance to depth in high priority areas (Alternative 4). For example, the cost of land use controls (such as construction monitoring and escorted access) are the same under all three alternatives (Alternatives 2, 3, and 4). We would expect that land use controls would be more expensive on lands that have not been cleared of MEC-to-depth. Likewise, one would think the 5-year reviews should be more complex and expensive for lands that had not been cleared of MEC.

The “Habitat Management” section of the cost estimates varies (years 2-13 for Alternative 2, years 2-27 for alternative 3, and years 2 to 18 for Alternative 4); yet habitat management will presumably be required for the entire 30-year period analyzed under all of the alternatives. We recommend you include the Federal government costs (whether BLM or Army) for habitat management for the entire period for all alternatives.

Response 3: Please see Response to DTSC Comment 4 and DFG Comment 2. The cost assumptions will be revised to clarify the components and durations of monitoring, maintenance, land use controls, erosion monitoring, and UXO support and services for each of the alternatives. The cost estimate for each alternative includes

estimated costs and durations of habitat management activities required by the HMP.

Comment 4: The Army states that Alternative 4 complies with Applicable or Relevant and Appropriate Requirements (ARARs), the Habitat Management Plan (HMP), and the biological opinions from the Service. However, it is not clear that the management actions specified in the HMP, biological opinions, and draft HCP (which are intended to comply with the Endangered Species Act, an ARAR) can be carried out as intended if the habitat management area is left with subsurface MEC. Our primary concern is whether the additional costs of executing the required habitat management activities when subsurface MEC is present can reasonably be expected to be funded over the long term. Please describe how this issue can be addressed.

Response 4: Long-term UXO safety support to assist implementation of post-disposal habitat management is identified as a component of each remedial alternative. Estimated cost of long-term UXO safety support is included in the FS. Please also see Response to Comment 3 and DFG Comment 2. Procedures for requesting funding of cleanup and long-term monitoring requirements are in place and will be followed for actions identified as part of the selected remedy.

Comment 5: For Alternatives 3 and 4, the draft document assumes (Tables A4, A5) that 30 acres of lands will require “excavation/sifting” due to the high density of anomalies. Our understanding (from the Track 3 meeting at Fort Ord on September 6, 2006) is that high density areas may be abundant and excavation and sifting could be needed in 50 percent or more of Track 3 under alternative 3 (i.e., 3,200 acres of the 6,500-acre area) and up to 50 percent of the estimated 650 acres selected for clearance to depth in Alternative 4. Please provide a more detailed description of the assumptions used to estimate the area requiring excavation/sifting in alternatives 3 and 4, and proposed means to reduce the uncertainty associated with this issue. Excavation and sifting on large scales could have a significant effect on listed species and the plant communities in which they occur.

Response 5: It is not possible at this time to quantify the exact number of high anomaly density areas that could be present in the Impact Area. However, for costing purposes in the FS, the Army has assumed 30 acres. As part of the approach to further refine removal options for each polygon, an additional step has been proposed as outlined in Response to Supplemental EPA Comment 2. The text will also be revised to clarify the impacts on habitat that would be significant for areas that may be subjected to excavation/sifting. Please also see Response to DFG Comments 3 and 4.

Comment 6: We recommend the Army consider an alternative that clears to depth all areas except those “special case” areas that require excavation and sifting. This

would allow a greater level of freedom for BLM, as the future land managers, to conduct habitat management activities as required. It appears that the costs and time to completion would be intermediate between Alternatives 2 and 3, but long-term habitat management costs and MEC monitoring costs should be reduced. The “special case” areas would still require access controls.

Response 6: Please see Response to Supplemental EPA Comment 2 and BLM Comment 5.

Comment 7: The estimated time required to implement the various alternatives may influence the decision of which alternative is ultimately chosen. The time estimate for the alternatives that involve surface clearance only (Alternatives 2 and 4) seem short, given the challenges of prescribed burning in the Monterey Bay area. Please include the assumptions on which the time estimates for the various alternatives are based.

Response 7: The text will be revised to clarify the basis for assumptions on the time required to implement prescribed burning.

Comment 8: The Service would like to see or discuss planning, scheduling, and environmental analysis that integrates the plans for chemical (e.g., lead) remediation, explosive compounds remediation, and MEC removal activities on lands where more than one of the three is required.

Response 8: Based on the Basewide Range Assessment (BRA) program, soil contamination areas that would require remediation have largely been identified. The Army has consulted with U.S. Fish and Wildlife service on the ecological impacts from identified soil characterization and remediation activities. The Army intends to enter into consultation with the U.S. Fish and Wildlife Service on the cleanup of metals and explosives compounds when the Draft Feasibility Study on Site 39 and the Draft Final Ecological Risk Assessment for Site 39 are completed. It is anticipated that these documents will be completed in 2007. The consultation would request agreement on what metals and explosive constituents need to be removed from Site 39 and what could remain.

Comment 9: Alternative 4, the preferred alternative, specifies clearing the vegetation by burning followed by surface clearance only (except for fuel breaks and roads and other select areas), then scanning the remaining areas for subsurface anomalies and digitally mapping them. Alternative 3, the removal-to-depth alternative, requires the additional step of removing the subsurface anomalies. We request that you include a discussion in the text that isolates the costs of the actual subsurface removal under Alternative 3 and compares it to the increased costs that the long-term management of the habitat reserve would require under Alternative 4’s surface-only MEC clearance. Discussing these relative costs in the text will help reviewers compare the alternatives.

Assuming Alternative 4 is selected, if at any point in the future further subsurface MEC removal becomes required(e.g., due to desire for increased recreational access or refined risk assessment) then the costs to clear the vegetation will have to be re-incurred, along with the administrative costs of returning. These additional potential costs of selection Alternative 4 should be acknowledged in the text.

Response 9: The cost assumptions will be revised to clarify the components and durations of monitoring, maintenance, land use controls, erosion monitoring, and UXO support and services for each of the alternatives. The description of Alternative 4 will be modified in the FS to incorporate a process to further refine removal options for each polygon, in order to address priority areas as outlined in Response to Supplemental EPA Comment 2. Please also see Response to DTSC Comment 4 and DFG Comment 2.

Department of Fish and Game
Letter dated November 2, 2006
COMMENTS

Comment 1: The HMP and the HCP (which is still in draft form) identify a number of listed and sensitive species which will be conserved and managed in habitat areas, providing mitigation for impacts of development base-wide. A significant portion of the habitat area (approximately 6,500 acres) is part of the Impact Area which is addressed in the RI/FS, and provides habitat for a number of the target species and sensitive natural communities which are the focus of the HMP and HCP. Both the HMP and the HCP commit to management of the maritime chaparral and other plant communities on the former Fort Ord via the use of prescribed fire: restoration of habitat utilizing direct planting of seeds and plants; control of non-native invasive exotic plants; and monitoring of the effects of prescribed fire on the target species and natural communities.

Response 1: Comment noted.

Comment 2: We are concerned that the Preferred Remedial Alternative identified in your document, Alternative 4, would compromise the ability of future managers of that area from implementing management that is a required element of the HMP and the HCP, such as prescribed fire management, vegetative restoration and control of exotic plant species. Surface-only clean up of habitat areas would severely restrict many of the planned management activities in the habitat area, such as the ability of fire crews from providing pre-treatments; aggressively controlling prescribed fires and wildfires, except from a distance; providing exotic plant control efforts; implementing habitat restoration activities; and monitoring the effects of management on target species and communities. In addition, the cost of planning, conducting and monitoring prescribed burns and exotic plant removal in these areas would be higher given the need for escorts for any work on the ground. These costs need to be factored into the analysis of the alternatives, over the 50-100 year life of the HMP/HCP.

Response 2: The Army acknowledges the concerns related to increased costs associated with planned management activities in areas where removal actions are limited to surface removal only. However, the Army maintains that habitat management activities can be completed using alternative methods that would likely involve UXO escort and support. The costs of MEC removal and long-term UXO support are presented for a 30 year period in the FS consistent with USEPA Guidance for preparing cost estimates in the FS.

Comment 3: Alternatives 3 and 4 also specify that some areas would need excavation/sifting for adequate remediation. We are concerned that remediation via excavation/sifting would require a much higher level of effort to restore those areas to high quality habitat. The impacts of excavation/sifting on the habitats and species of interest in the habitat areas and costs identified for efforts needed to fully mitigate the impacts of that style of remediation should be evaluated.

Response 3: The text will be revised as suggested to clarify the impacts on habitat that would be significant for areas that may be subjected to excavation/sifting, and incorporate the clarifications in the evaluation and comparison of alternatives.

Comment 4: Additionally, we are concerned that the analysis of MEC in the Impact Area is based on information from an area which has more munitions, and may overestimate remediation needs, including the “special case” areas which need excavation/sifting. This in turn may overestimate the effort and cost which would be needed for remediation to depth over a larger portion of the Impact Area. The RI/FS should identify a refined methodology for estimating remediation needs over the entire 6,500-acre habitat area, and clarify how “special case” areas were identified and quantified. This could modify the cost figures which are presented in the RI/FS, and given the as yet undisclosed increased costs for management of the habitat areas over the next 50-100 years, could change the preference given to Alternative 4.

Response 4: It is not possible at this time to quantify the exact number of high anomaly density areas that could be present in the Impact Area. However, for costing purposes in the FS, the Army has assumed 317 acres for Alternative 3 and 85 acres for Alternative 4. As part of the approach to further refine removal options for each polygon, an additional step has been proposed as outlined in Response to Supplemental EPA Comment 2.

Comment 5: We recommend that the Army refine the estimate of remediation needs, including “special case” areas. This would facilitate the habitat management required by the HMP, and anticipated in the HCP, to be conducted over the long term, and would lessen costs for such management except in the “special case” areas.

Response 5: Please see Responses to Comments 3 and 4.

**California Department of Fish and Game, Office of Spill Prevention and Response,
Resource Assessment Program
Letter dated October 24, 2006
COMMENTS**

Comment 1: The Impact Area risk assessment in the RI is based on site characterization data from the portion of the Impact Area that has been burned. Thus, there is a great deal of uncertainty regarding how well the assessment applies to the uncharacterized portions of the Impact Area. It is stated that the existing data likely overestimate the density of items containing MEC (Section 4.1.1). DFG-OSPR is concerned that relying on existing data to make decisions for the entire MRA may result in limiting MEC remediation to depth in less contaminated area and unnecessarily restricting activities. The RI/FS should outline a process for adjusting remedial decisions as more site-related data becomes available.

Response 1: Please see Response to Supplemental EPA Comment 2. A process will be developed to allow for review of the surface removal data by the BCT to further refine removal options for each polygon. This process will be described in the FS and further refined in follow on work plans.

Comment 2: The RI focuses on physical risks to humans and does not address potential physical risks to wildlife. A statement on page 84 (Section 4.1) indicates that the explosive risks to plants and animals are expected to be low but no discussion is provided to support this conclusion. Additionally, the proposed access management measures and MEC recognition training will not prevent wildlife exposure to MEC items. We recommend that additional discussion be included to outline and address physical hazards to wildlife from MEC.

Response 2: The text will be revised to include observational data on why the risks are expected to be low. Please also see Response to HERD Comment 10D.

Comment 3: The RI/FS only addresses physical risks and does not evaluate potential chemical hazards to humans or wildlife (Section 3.63.). In order to fully evaluate potential risks and remedial alternatives, the results of the ecological risk assessment for the Impact Area should be integrated into the RI/FS to support the decision-making process.

Response 3: As stated in the RI/FS, the chemical hazards to humans and ecological receptors are being evaluated as part of the Basewide Range Assessment. At this time, there are areas of the Impact Area that cannot be fully evaluated due to the presence of thick vegetation and MEC. Completing the RI/FS for the physical hazards related to MEC and conducting remedial action would allow further evaluation of

chemical hazards in such areas to take place. The programs are designed to work together and progress on addressing the physical risks associated with MEC will result in further progress in addressing the chemical risks in the same area.

Comment 4: Please add the Fish and Game Commission Wetlands Policy as a “to be considered” polity under the potential applicable or relevant and appropriate requirements (ARARs) listed in Table 1.

Response 4: This policy will be included in the table of potential ARARs as TBCs, as suggested.

Comment 5: Staff of the Central Coast Region of DFG will be providing comments on the significance of habitat destruction and restoration alternatives in the Impact Area and implications for the ongoing development of the Habitat Conservation Plan. Comments from the Region will be sent under separate cover directly to the Army. The Regional contact is Deborah Hillyard, Staff Environmental Scientist; she may be reached by phone (805) 722-4318 or email (dhillyard@dfg.ca.gov).

Response 5: Responses to Central Coast Region comments are provided below.

Conclusion: DFG-OSPR believes the key limitation of the RI/FS is the selection of a remedial alternative for the MRA before all areas have been characterized, human and ecological hazards have been identified, and potential ecological impacts from remedial activities have been described. We look forward to reviewing the revised RI/FS that addresses our concerns, as provided herein. If you have any questions or require further details, please contact Patty Velez by phone (831-649-2876) or email (pvelez@ospr.dfg.ca.gov).

Response: Please see Response to Supplemental EPA Comment 2.

EcoMunition Corporation
Letter dated October 27, 2006
COMMENTS

Comment 1: Fifty-eight references are made to 40mm projectiles throughout the document. Please be specific by nomenclature or type. The 40mm projectiles range by type from antiaircraft to grenades. The differences in materials, functioning, fillers, and hazards are significant.

Response 1: The type of 40mm projectiles present will be added to the text as appropriate.

Comment 2: Section 3.3.2.3, Shaw Environmental, first bullet, change waking to walking.

Response 2: The text will be revised as suggested.

Comment 3: The usability of ranges 43 through 48 data is suspect. References are made to the data as not being in database, not QC/QA, preliminary, and possibility requiring correction. Additionally, the draft MRS 43-48 IA TIP does not contain the required digital QA report which addresses the quality of digital QC and the MEC removal. Why is suspect data being analyzed to form significant determinations concerning the occurrence and removal of MEC?

Response 3: Please see Response to HERD Comment 5. The digital QA report is included in the draft final MRS-Ranges 43-48 Interim Action Technical Information Paper dated October 31, 2006.

Comment 4: Section 4, Risk Assessment, does not address receptor exposure to physical hazards contained within MEC uncleared and MEC partially cleared land such as Special Concern Areas (SCAs) that are adjacent to, or contained within, MEC cleared grids.

Response 4: The Baseline Risk Assessments assume that all of the MEC removed from Ranges 43 through 48 is still present. Although high density MEC areas were not considered as separate items in the risk assessment, the density of MEC removed and the type of MEC removed results in the highest risk score, an E for the Baseline risks. Assuming a higher density due to high density areas would not result in a change to the Baseline Risks.

In calculating the theoretical After Action Risks for use in the Feasibility Study, for the removal to depth scenario, the assumption was made that all detected surface MEC would be removed and that all detected MEC present between the surface and 1 foot would be removed. It was assumed that some MEC would remain below 1 foot. Following a removal action in a specific area of the Impact Area the

After Action Risks would be evaluated using the removal specific data. If high density MEC areas are present and not removed, this information would be factored into the evaluation.

Comment 5: Section 3.3.2.2, Parsons, addresses analog QA but does not contain digital QA results. The digital QA findings should indicate the overall quality of the MEC removal process. It should be noted that draft MRS 43-48 IA TIP also does not address digital QA results.

Response 5: This information is included in the draft final MRS-Ranges 43-48 Interim Action Technical Information Paper dated October 31, 2006.

Comment 6: Section 3.5.3.1, Spatial Distribution, Fuzes, is not consistent with Section 3.5.1, Training Practices, Fuzes. The M48 fuze is used primarily in high explosive (HE) projectiles. It is commonly found installed in 75mm, 76mm, 90mm, and 105mm HE projectiles. It should be assumed that a functioned M48 fuze has functioned a more hazardous high explosive projectile unless evidence presents otherwise.

Response 6: The text will be revised to indicate that prior to WWII the M48 fuze was used primarily in high explosive projectiles; however, after WWII the fuze was used primarily in smoke producing and training items.

**United States Department of the Interior, Bureau of Land Management
Letter dated October 13, 2006**

In the case of the Track 3 RI/FS, the document will need to disclose the likely consequences of implementing the various remedial alternatives to determine whether the clean up options will lead to a MEC remediation that the BLM can support. This is consistent with the National Contingency Pla[n] that explains that the RI/FS remedies must be evaluated in relation to how they are protective of human health and the environment. In this regard, the BLM recommends that the RI/FS clearly disclose the following:

Comment 1: What is the risk of implementing the various remedial alternatives on the MEC clean up crews and contractors performing the remedies?

Discussion: While the Track 3 RI/FS discloses the MEC risks to some re-users of the area, there is no discussion of the risk to clean up teams performing the remedial actions. As such, we assume that all remedial options are feasible from a safety standpoint and that MEC clean up risks can be alleviated to an acceptable level using procedures and equipment that would minimize MEC exposures. Should this not be the case, the Track 3 RI/FS should disclose the associated risks to clean up crews so that the options can be better compared.

Response 1: Information will be provided on the potential risks to MEC cleanup crews; however, it should be noted that the clean up is performed by specially trained individuals within the requirements of a site specific health and safety plan.

Comment 2: What are the likely short-term (i.e. less than 10 years) and long-term effects of the various remedial alternatives on species protected under the *Installation-Wide Multispecies Habitat Management Plan for Former Fort Ord, California (HMP)* and the pending *Fort Ord Habitat Conservation Plan (HCP)*?

Discussion: The Track 3 RI/FS does not disclose the anticipated short-term and long-term effects of the remedial options on the natural environment. For alternatives that prescribe excavations for MEC remediation, the Track 3 RI/FS should disclose how many acres of various habitat types might be subjected to such procedures. We recognize that the remedial program is part of the reuse scenario evaluated by the Army within the Environmental Impact Statement covering the 1997 Supplemental Disposal and Reuse Plan; however, that plan does not differentiate between remedial options for the Track 3 Area and does not provide the level of detail necessary to evaluate the environmental effects of the individual options.

We recognize that the Track 3 RI/FS is striving to comply with the HMP and

subsequent U.S. Fish and Wildlife Service Biological Opinions related to such, and included the HMP as an applicable or relevant and appropriate requirement (ARAR). While the HMP provides a solid foundation to help guide the remediation, the Track 3 RI/FS discloses that alternatives 2-4 all comply with the HMP. Because there is no disclosure of short-term and long-term environmental affects on HMP/HCP species, there is no way to judge one option as being more protective of the environment over another option.

It is our experience based upon 10 years of habitat restoration activities at the former Fort Ord, that the maritime chaparral habitats are fairly resilient. Small to medium-sized areas that require full excavations for MEC cleanup can usually be restored with some effort as long as the seedbed is protected. The seedbed can be protected by ensuring that the vegetation is removed through prescribed burning (as opposed to large scale cutting) and by using the sifted topsoil to reclaim the site. Some of these areas may require plan[t]ing maritime chaparral seedlings to speed the recovery. Weed abatement of invasive species is very important following the disturbance to ensure that vegetation recovery is form target species.

For large-scale sifting operations at Fort Ord, there is little information available to determine how long the denudation effects persist. It is reasonable to assume that it would take over 5-10 yeas for large sites to begin to reflect the species diversity and relative abundance that was found in the reference (pre-existing) community. As an ARAR, the HMP's goal of restoring habitat to pre-remedial conditions within 5 years of the cleanup is problematical. The BLM is supportive of a longer time frame to be used in evaluating restoration success for a remediation effort.

Response 2: The text will be revised as suggested to clarify the impacts on habitat would be significant for areas that may be subjected to excavation/sifting, and incorporate the clarifications in the evaluation and comparison of alternatives. Please also see Response to DFG Comment 3.

Comment 3: Comments on the Description of the Future Land-Use (Volume 1, Section 2.2.3.3 and Section 3.6.1). On July 30, 2004, we provided the Army a copy of a Draft Proposed Management Plan, Multiple Range Area, Former Fort Ord, California. That management plan has been refined over the last two years to better describe our management intentions at the former Fort Ord. Working with the Fort Ord Reuse Authority (FOR A), U.S. Fish and Wildlife Service (USFWS), California Department of Fish and Game (CDF&G), local governments and others, we have revised the management program that we hope soon will be released for public review within the HCP. The current HCP management program for the BLM lands in the Natural Resource Management Area is provided in Attachment A. Please refer to that management program as it will supersede the management program within

the HMP that formulates our current generic direction.

Furthermore, the Track 3 RI/FS should disclose the 1,000-foot-wide study corridor for consideration of a new State Route 68 running along the southern boundary of the project area. While this alignment may never be used for a transportation system, the fact that the easement is in place should be disclosed and assessed within the document. Should this alignment ever be needed by the State Department of Transportation (CalTrans), the reuse would certainly be considered a “deeper intruding receptor” within the easement (see below).

Response 3: The Risk Assessment will be updated to more accurately reflect the types of activities anticipated for management of the habitat reserve based on information provided by BLM. The Highway 68 Easement will be described in the report; however, the current anticipated reuse for that area is habitat reserve because of the uncertainties involved with the project. The Army would still maintain responsibility for completing any necessary removal actions that would be associated with any future construction of the highway.

Comment 4: Comments on the Description of Human Exposure Routes (Volume 1, Section 3.6.2). The Track 3 RI/FS describes potential MEC receptors based upon the identified reuse options and classifies the receptors as being either: trespassers, surface only receptors, shallow intruding receptors or deeper intruding receptors. The description and classification of these receptors should be reevaluated to more accurately reflect the types of land-management activities necessary for implementation of the HMP and HCP. Below are a few examples. Refer to Attachment A for a more complete list of HCP management actions/activities that should be included in the Track 3 RI/FS.

The list of activities found under the header “surface only receptors” should be modified as follows: 1) Fire-fighters conducting prescribed burns will frequently need to scratch hand lines around spot fires that ignite beyond the containment lines, or “chunk” (i.e. pick away at with hand tools such as pulaskis) smoldering logs that remain within burn units. These types of activities are more appropriately described as “shallow receptors”. While some fire-fighting operations are less intrusive on the ground (i.e. hand crews). Successful prescribed burning at Fort Ord involves use of both hand crews and fire engines. 2) Habitat monitors will frequently need to penetrate the soil when performing plant and animal inventories and should be listed as “shallow receptors”. For example, surveys for black legless lizards often include “cover board” surveys where biologists look under plywood squares and scratch under the squares to unearth black legless lizards that are attracted to the micro habitats under the cover boards. Similarly, HMP/HCP animal monitors will likely require inspection of underground burrows that

involves some penetration of the subsurface. Also, plant monitors often use pin flags to mark plant locations, or set up transects that involve palcing stakes in the ground. These types of activities are more appropriately described as “shallow receptors”.

The list of activities found under the header “shallow intruding receptors” should be modified to include the following common land management activities: 1) Weed abatement using handtools includes digging out plants and their root systems. On the existing BLM lands at Fort Ord, herbicide spraying (a surface only receptor) accounts for only a small percentage of our efforts in controlling noxious weeds. For example, in 2005 the BLM spent 2,144 hours in weed abatement at Fort Ord – of which, 12% was herbicide use, 82% was manual removal (shallow intruding receptor), and 6% using other techniques (i.e. flaming). 2) Fire-fighters (conducting prescribed fire operations and fighting wildfire) frequently scratch away at the surface to develop firebreaks. While there are about 50 miles of existing fuelbreak in the Track 3 Assessment Area, additional firebreaks will be needed to support burn operations. Fuelbreaks are constructed using both hand crews and rotary mowers (such as an ASV machine). Both types of fuelbreak operations scarify and penetrate the soil to some extent. 3) Habitat restoration workers dig holes to plant native plants on restoration sites. While some holes are shallow (i.e. planting rose-pot sized seedlings) other shrubs may require digging holes below 12 inches (i.e. planting one gallon pot sized plants).

Response 4: The Risk Assessment will be updated to more accurately reflect the types of activities anticipated for management of the habitat reserve based on information provided by BLM.

Comment 5: Comments on the Remedial Options Evaluated (Volume 2, Section 4.4). The suite of remedial options evaluated includes Alternative 1 (No Further Action), Alternative 2 (Visual Surface MEC Remediation), Alternative 3 (Removal to Depth MEC Remediation), and Alternative 4 (Combination of Visual Surface Removal and Removal to Depth MEC Remediation). Based upon the Army’s experience in the Ranges 43-48 remedial response, it is unclear whether Alternative 3 would include a complete subsurface removal, or only a surface removal in some areas that were considered “special case” areas. In the case of the response within Ranges 43-48, the Army only surface cleared several areas (most notably Range 47) that were designated as “special case areas” although the *Record of Decision for the Interim Action for Ordnance and Explosives at Ranges 43-48, Range 30A, and Site OE-16* called for a removal to depth over the entire site.

Perhaps another alternative could be evaluated that would be a modification of Alternative 3 – we will call this Alternative 3b. This additional alternative would prescribe a removal to depth MEC remediation for the entire area;

however, only a surface removal in areas designated as “special case area”. “Special case areas” would need to be clearly defined but would presumably mean areas that would: 1) expose clean-up workers to unacceptable risk from exposure when performing a subsurface remediation; or 2) require large-scale subsurface sifting operations over rare plant and animal habitats that could not be reasonably restored within a given timeframe (we recommend something longer than 5 years); or 3) be excessively expensive to clean-up subsurface areas on a per unit basis. Army munitions experts would need to make an informed estimate of how many acres would be classified as such for purposes of cost estimating and disclosing impacts.

The Army’s preferred Alternative 4 describes a MEC clearance to depth of up to 10% to support fuelbreaks and other limited areas. It is unclear, however, where this 10% figure is derived. For example, in volume 2 – Section 4.3, the Track 3 RI/FS explains that fuelbreak MEC clearances might include 200’ widths on either side of a 15’ wide fuelbreak road. If there are about 50 miles of fuelbreaks (our estimate) within the 6,560 acre study area, then this would mean that the MEC removal to depth within and near the fuelbreaks would be 2,039 acres of 31% of the study area.

Response 5: Please see Response to DTSC Comments 2 and 11, and Supplemental EPA Comments 2 and 6. The text will be revised to clarify the types of areas within the Impact Area MRA where MEC removal to depth would be implemented under Alternative 4. It is possible that additional areas of high anomaly density will be identified within the Impact Area; a process will be developed to evaluate areas after the surface removal is completed to determine whether additional removals are required. High density areas identified in the future would be addressed through his process.

Comment 6: Comments on the Complexities of Managing Surface Cleared Areas Only. One of the balancing criteria that the Army uses to evaluate the effectiveness of a remediation is the long-term effectiveness and permanence of the action. Areas that are known to contain subsurface MEC and undergo only a surface clearance are challenging to manage even under the most custodial of management programs. As mentioned above (and shown in Attachment A), many of our habitat enhancement, monitoring and protection programs involve scratching below the surface from time to time. On the sandy soils of the range areas, even the act of walking from one point to another reasonably penetrates the soil surface to some extent.

Soil movement is a common phenomenon in the maritime environment – with wind and rain causing erosion and deposition of sandy soil particles. This soil movement would likely cause some subsurface MEC to become exposed through time, and other MEC to become further buried through depositional processes. The Track 3 RI/FS discloses that soil loss may be 3/100 inches per

year in some places under Section 4.1.3.1. However, more massive, usually storm-related, erosion events and gully formation processes have been observed to occur on Fort Ord at much faster rates with the result that MEC could be expected to occasionally be exposed on the ground surface. The document does not disclose how long Alternative 2 (Visual Surface MEC Remediation) and Alternative 4 (Combination of Visual Surface Removal and Removal to Depth MEC Remediation) would remain effective. It is reasonable to assume that after some period of time, additional surface MEC remediation would be required to maintain a surface MEC remediation.

Response 6: The Risk Assessment will be updated to more accurately reflect the types of activities anticipated for management of the habitat reserve. The Army does not consider the activity of walking on the surface as a subsurface activity; therefore, for potential receptors that may only walk the site, surface only receptors will be retained for consideration in the risk assessment.

The description and estimated costs for Alternatives 2 and 4 will be revised to include a post-removal erosion survey and monitoring for surface removal areas. Please also see Response to DTSC Comment 4.

Please see Response to USFWS Comment 9 that indicates the text will be revised to provide additional detail on the aspects of the remedial alternative costs associated with long term maintenance, monitoring, and land use controls and UXO services and support. The Army acknowledges the concerns related to increased costs associated with planned management activities in areas where removal actions are limited to surface removal only; however, the Army maintains that the activities required can be completed using alternative methods that will include UXO services and support.

Comment 7: Summary.

The BLM appreciates the efforts of the Army in their MEC remediation efforts at the former Fort Ord. The Track 3 RI/FS is an important step in developing a MEC remediation that can accommodate a reuse program that will be effective. To assist our agency in making an informed decision on the transfer of additional lands at Fort Ord, we request a more thorough review of the environmental consequences of implementing the various options – including a map and estimate of acres showing suspected “special case areas” and known or suspected locations of HMP animal and plant species. We also feel that there should be consideration of an additional alternative (i.e. Alternative 3B) that would include a subsurface MEC remediation, but only a surface remediation in “special case areas”. We encourage the Army to evaluate within the Track 3 RI/FS our prescribed management programs under the pending HCP that are shown in Attachment A. Finally, we encourage the Army to consider the long-term effectiveness of the various remedial options.

Response 7: Please see Responses to EPA General Comments 1 and 2. The Army is committed to developing a remedial alternative that would support effective management of the area as a habitat reserve. The RI/FS will incorporate updated descriptions of habitat management activities provided by BLM. Additional information about potential impacts to the habitat, and mitigations, will be included in the discussion of each alternative.

Monterey Bay Unified Air Pollution Control District
Letter dated October 25, 2006
COMMENTS

- Comment 1:** Volume 1, Section 2.2 “Physical Setting”, p. 10: To adequately describe the physical setting of the project, mention should be made of the close proximity of residential areas to the areas being remediated.
- Response 1:** The text will be revised to include this information. It is included in Section 2.2.1 Location.
- Comment 2:** Volume 1, Section 2.2.4 “Site Features”, p. 15: There is not an adequate discussion of air and meteorological features, including detailed local wind characteristics, since these are critical elements in determining the transport of emissions from the methods chosen for vegetation clearing and disposal of MECs.
- Response 2:** The text will be revised to include this information.
- Comment 3:** Volume 2, Section 3.3.1 “Vegetation Clearance Via Prescribed Burning”, p. 31, para. 2: The methods included in Table 12 of the “Vegetation Clearance Technical Memorandum” should be retained for future consideration.
- Response 3:** The text will be revised to clarify that the other methods would be retained for consideration on a limited basis depending on area-specific conditions identified in the work plan for each area.
- Comment 4:** Volume 2, Section 3.3.1, pp. 31-32: The options briefly presented but not further considered should be included in a periodic re-evaluation of potential options as part of the remediation process. For example, since the efficacy and rebound of vegetation after a cut and burn scenario has not been determined, it seems premature to exclude its future re-evaluation as an option.
- Response 4:** The text will be revised to clarify that the other methods would be retained for consideration on a limited basis depending on area-specific conditions identified in the work plan for each area.
- Comment 5:** Volume 2, Section 3.3.1, p. 32, first bullet and throughout the document: It has not been successfully demonstrated that annual removal of such large amounts (up to 800 acres) of vegetation by prescribed burning is feasible without adverse impacts to the surrounding communities.

- Response 5: Please see Response to Supplemental EPA Comment 1. It is anticipated that the vegetation will be removed in several small burns as was completed for MRS-16. Details of the burn plan for each year will be provided in an Implementation Work Plan. This work plan will be available for review and comment.
- Comment 6: volume 2, Section 3.3.1., p. 32, second bullet and throughout the document: It has not been successfully demonstrated that the clearance of 400 acres of vegetation by one prescribed burn is feasible without adverse impacts to the surrounding communities. In addition, the width of necessary firebreaks might be a better measure of separation, rather than acres.**
- Response 6: Please see Response to Comment 5.
- Comment 7: Volume 2, Section 3.3.1.1, “Potential Impacts to the Public”, p. 34: The smoke levels recorded during the October 2003 event exceeded state and federal standards for particulates. There are increased risks for adverse health affects associated with such high rates of smoke exposure to even healthy individuals. Please refer to the document “Wildfire Smoke: A Guide for Public Health Officials”, published by the U.S. EPA, Region X. In addition, a recent study (March 8, 2006) published in the Journal of the American Medical Association by Francesca Dominici at Johns Hopkins University pointed out a strong correlation between increased daily hospital admission rates (for cardiovascular diseases and respiratory diseases) and increases in the concentration of particulate matter from one day to the next.**
- Response 7: Please see Response to Supplemental EPA Comments 18 and 19 on Volume 2. The text will be revised to provide additional detail on potential impacts to the public associated with conducting prescribed burns.
- Comment 8: Volume 2, Section 3.3.1.1, p. 35, middle paragraph: Historically, smoke impacts have been the problem. Unlike normal prescribed burns, burns for the clearance of vegetation in preparation for removal of MECs typically cannot be safely or easily terminated.**
- Response 8: Please see Response to Comment 7 that indicates the FS will be revised to provide a more detailed discussion of the potential impacts to the public associated with conducting prescribed burns, including smoke impacts and preparations and protocols that will be implemented for safe management of the burns.
- Comment 9: Volume 2, Section 3.3.1.1, p. 36, para. 2: It is unclear whether this would be several consecutive days of continuous burning or several discrete burns.**
- Response 9: Please see Response to Comment 5 and Supplemental EPA Comment 1.

Comment 10: Volume 2, Section 3.3.1.1, p. 38, para. 2: It is unclear whether the frequency of escapes is for general prescribed burns or for those specific to Fort Ord; if the latter, that would not be consistent with the District's records. There is a definite difference when there is no MEC involved.

Response 10: Please see Response to Comment 8.

Comment 11: Volume 2, Section 5.2.7 "Cost", p. 77, last para. and Table 3: It does not appear that relocation (listed under the Remarks for row 2 on p. 3 of Table 1) costs were included in these estimates. See also District comment 13 below.

Response 11: The text will be revised to provide additional discussion of the reasons voluntary temporary relocation program was not included as a component of prescribed burning, and Table 1 will be revised to delete the reference to relocation as a potential component under the Remarks.

Comment 12: Volume 2, Section 6.0, items (5) and (7), p. 82: Due to the complexity of the project, 800 acres per year for a period of 8 years is not a realistic objective.

Response 12: Please see Response to Supplemental EPA Comment 1.

Comment 13: Volume 2, Table 1, pp. 3 and 5: Relocation is mentioned in the Table as a mitigation measure to minimize public exposure to smoke. It is not mentioned elsewhere in this document.

Response 13: Please see Response to Comment 11.

Fort Ord Environmental Justice Network (FOEJN)
Letter dated October 31, 2006
(Prepared by Environmental Stewardship Concepts [ESC])
COMMENTS

RECOMMENDATIONS

- Comment 1:** **The Army should discontinue its use of prescribed burns as a method of vegetation clearance. Contrary to the claims in the report, any action that involves prescribed burns like those proposed will not gain public acceptance.**
- Response 1: Comment noted. Based on the results of the RI/FS, the Army believes prescribed burns conducted in phases to clear vegetation and allow for MEC removal in a manner that is safe for workers is the best vegetation clearance method for implementation in the Impact Area MRA. The Army acknowledges the concerns identified by some members of the public regarding the potential impacts of conducting the burns, and will address those concerns through area-specific plans.
- Comment 2:** **The risk assessments for “surface only receptors,” or individuals working on the surface but not performing activities in deeper soil, cannot be trusted in the area where limited surface removals occurred in Mortar Alley and MRS-30A. No formal inspections were documented for these removals, a process usually done through a quality assurance/quality control (QA/QC) analysis.**
- Response 2: The surface removals completed in Mortar Alley and Range 30A were conducted as time critical removal actions to address the MEC most likely to be encountered by an individual trespassing in the Impact Area. Vegetation was not removed so less than 100% of the areas were inspected. These areas are not considered completed, and are part of the Impact Area MRA that is being addressed in this RI/FS. These areas will be subject to additional removal actions.
- Comment 3:** **Site security still needs significant improvement, shown by the security failures in 2005.**
- Response 3: Please see Response to DTSC Comment 12. The Site security plan continues to be updated and improved based on past experience. The Army will continue to provide site security until the property is transferred.
- Comment 4:** **All workers performing intrusive activities in the entire Fort Ord should be required to receive MEC (munitions and explosives of concern) recognition and safety training just as the workers in the Impact Area now receive.**
- Response 4: This RI/FS addresses only the Impact Area MRA. Areas outside the Impact Area MRA are addressed under separate documents. If appropriate, these documents

address the requirements for intrusive worker training in areas outside the Impact Area. In addition, the Army offers ordnance recognition training to anyone who requests it, and all future Fort Ord deeds will include a contact number and instructions about what to do in case of a discovery of military munitions.

DOCUMENT SUMMARY:

Track 3 sites are those “areas where MEC (munitions and explosives of concern) is suspected or known to exist, but investigations are not yet complete or need to be initiated, or an area identified in the future.” These sites present a significant hazard to public health through possible exposure to unexploded ordnance, which can be potentially fatal. The remedial investigation and feasibility study (RI/FS) is a review of previous investigations and actions from which various alternatives for cleanup are identified and selected based on risk analysis and other criteria.

Using data primarily from MRS Ranges 43-48 where the prescribed burn/uncontrolled burn took place in 2003, the Army evaluated potential risks to individuals performing activities both on the ground surface and digging beneath the surface, involving significant penetration into the soil. Visual surface removals were determined to only reduce risks to individuals working on the surface to be “medium” while removals to depth reduced risks to these receptors’ risks to the “lowest” designation. Individuals performing intrusive activities greater than one foot below the surface remained at the “highest” designation, no matter the remedial action taken. Based on this information, the RI/FS recommends that a combination of surface removals and removals to depth (removing all identified items no matter their depth) to clean up UXO (unexploded ordnance) from within the impact area. The Army’s preferred method of vegetation clearance for these removal actions remains prescribed burning, which is not acceptable.

GENERAL COMMENTS

Comment 1: ESC agrees with the Track 3 RI/FS document that individuals performing intrusive activities are at high risk of harm, principally from unexploded ordnance (UXO). While many of the conclusions regarding risk are based on the heavily used MRS-Ranges 43-48 (where some of the highest densities of UXO have been found) and therefore can be considered to be fairly conservative, they have significant implications for other areas where removal actions have taken place. According to this document, deeper intrusions under any area where any removal action has taken place will place individuals at a high risk because of the failure rates and uncertainties surrounding even the best available detection methods of UXO. ESC has noted the problems that the Schonstadt magnetometer has in detecting deeper items in previous comments, and appreciates the Army acknowledging these issues.

Given this information, we again recommend that all workers performing soil

intrusive activities within the boundaries of the former Fort Ord receive a required MEC recognition and safety training. No removal action or investigation can completely assure that workers will not be exposed to UXO during these sub-soil activities. Therefore, there remains a great deal of uncertainty regarding the use of many areas of the base throughout its entire history, and consequently all such workers should be aware of the precautions needed to be taken in such areas. This training is not extensive (only 30 minutes) and should not be a burden to the future development of the base. The lack of such training could result in the injury or death of one or more workers and grind future redevelopment efforts to a halt. Given the minimal amount of effort required to prevent such an event, there is no justification for not explicitly requiring these safety measures.

Response 1: Please see Response to Comment 4 above.

Comment 2: Another issue involving uncertainty is determining the risk for individuals entering the areas designated as “Mortar Alley” and MRS-30A. Page 45 of the RI/FS notes that these two areas were subjected to limited surface removals, but that the relevant documents do not indicate if formal inspections were performed (QA/QC inspections). Until it can be established that these two areas did in fact undergo a thorough QA/QC process, risks to “surface only receptors” in the area should be ranked as “E” (highest) instead of the medium level that would otherwise be assigned to them based on the limited surface removal actions. If no QA/QC inspections took place at either of these sites, one should be performed as soon as possible to insure that the removal actions were sufficient.

Response 2: Please see Response to Comment 2 above.

Comment 3: The high levels of risk to surface only receptors identified within the report in areas where no UXO removal action have taken place, further demonstrates the need for better site security at Fort Ord. Numerous security breaches have taken place, some of which like those outlined in the “Draft MRS Ranges 43-48 Technical Information Paper” have been severe. The lack of security puts trespassers at risk, but more importantly it also puts the general public at risk if trespassers take UXO or MEC from the site. The RI/FS should note these security breaches and offer suggestions as to how to improve site security.

Response 4: Please see Response to Comment 3 above.

Comment 4: Prescribed Burns: ESC, FOEJN, and the public are dismayed that the Army continues to be unwilling to consider options for vegetation clearance other than prescribed burns. The public is strongly opposed to these burns since the 2003 burn escaped the control of the Army and its contractors and burned

three times the intended area. The Army has not acknowledged this opposition in any meaningful way, continuing to rely on the very short and incomplete (only 19 page including tables and figures) ATSDR report of 2005, and the 2002 Record of Decision where many of its core assumptions regarding the cost, safety, and effectiveness of prescribed burns were disproved by the 2003 burn of MRS Ranges 43-48. These assumptions are repeated in this RI/FS, which is an ideal venue to reexamine methods of vegetation clearance at Fort Ord. Unfortunately, the document makes no such effort.

Despite the objections noted above, the Army continues to maintain in this RI/FS that remediation options including prescribed burns are “likely acceptable to the public and other stakeholders.” The 2005 “Community Relations Plan” noted that the prescribed burn generated the most interest of all topics, most of it in opposition to the 2003 and future burns. The evidence and record of the safety and effectiveness of prescribed burns at Fort Ord is dubious and the public is well aware of this fact.

The draft MRS Ranges 43-48 Technical Information Paper earlier this year confirmed the public’s concern over the burning and the belief that burning is more expensive. One passage in particular demonstrates the failure of prescribed burns to even effectively clear vegetation. According to Table 12-1 of that report, nearly \$850,000 worth of extra expenditures were required to “mechanically and manually cut the unburned brush and leftover standing burnt stems and branches from the surface cleared grids.” With these costs, it can be safely assumed that the mechanical clearance of vegetation and debris did not occur on a small scale and was not a side effect of that burn’s escape from containment. The scale of this manual clearance is not noted and the text minimizes these implications in the RI/FS, stating only that it “may be conducted if necessary” in one sentence of the entire document. In the same paragraph prior to this tacit acknowledgement, the Army asserts that:

“Safety procedures require the vegetation be cleared to bare ground of approximately 6 inches above the ground surface....This level of clearance would be achievable using burning. Fire clears the vegetation and leaves the range in a condition that typically provides MEC with a clear, unobstructed view of the ground surface.” (Vol 2, pg 39)

These statements are in direct contradiction with the evidence from the draft Technical Paper. The clearance of unburned vegetation and more commonly the burnt stems and branches appears to be inevitable, implying that a more accurate title for removing vegetation via prescribed burns would be “prescribed burns with additional manual clearance.” Local residents and visitors understand and support the Army in trying to protect its contractors and clean up MEC at Fort Ord in the most expeditious manner possible. But

the Army must accept reality over official documents like the ROD when selecting solutions.

The first listed Threshold Criterion in Section 5 of the Feasibility Study is “Overall Protection of Human Health and the Environment,” and its definition states that “An alternative must eliminate, reduce, or control potential threats to public health and the environment through treatment or institutional controls.” Prescribed burning at locations like Fort Ord which are adjacent to densely populated residential areas fails to meet this requirement because it actually *creates* risk where there was none before. Even excluding the adverse health effects caused by smoke, the alternative still creates risk by creating situations where fires can burn out of control and threaten communities as they did in 2003. No matter the precautions taken, the risks remain and past experience supports this fact. These risks are compounded when the adverse health effects of smoke are considered.

ESC has noted in numerous comments and official correspondence the well documented risks associated with exposure to smoke. Increased chances of asthma, respiratory difficulty, cardiovascular disease, and other long term health effects are all well documented in the literature, including studies that have been sent directly to the Army by ESC. To date, none of the technical data presented by ESC in comments or correspondence regarding the toxicity of smoke have been refuted by either the Army or ATSDR. The Army’s only response appears to be noting that ATSDR is a federal public health agency, and that the Army must rely on their opinions as stated in the health consultation.

This approach fails to note that the information presented by ESC is from numerous articles from a variety of peer reviewed journals, while ATSDR’s consultation has not undergone such a review and would likely fail such a test with assumptions dismissing high concentrations of respiratory irritants because “...the pungent smell combined with its irritant effect on the eyes and nose [means] it is likely that someone breathing acrolen would make an effort to avoid further exposure to smoke from the prescribed burn” (ATSCR Health Consultation: Former Fort Ord Site, pg. 4). The ATSDR report does not mention that by the time concentrations of acrolen have reached the levels where its smell is apparent, an individual may already be having respiratory difficulty. As stated in previous comments, the ATSDR Health Consultation was flawed, incomplete, and inaccurate. ESC would have come to this conclusion even if ATSDR were not a federal agency.

Even with voluntary relocation programs, some portions of the population will not be able to avoid smoke exposure and will therefore be put at risk for severe asthma attacks and cardiovascular complications such as heart attacks. Noting that future burns will be smaller than the 2003 event is irrelevant to

this face, because it should be remembered that the 2003 burn was intended to be significantly smaller as well. Combining these facts with the demonstrated ineffectiveness of prescribed burns in removing brush without significant additional mechanical clearance, the major difference that prescribed burns have over other methods is its impact to ecological habitat.

ESC does not dispute the fact that fire is a naturally occurring event in chaparral communities. However, if this is the only reason for using prescribed burns over other options then it is not acceptable. It places the short term health of the ecosystem over the long term health of the community (as demonstrated in the Leikauf 2002 paper in Environmental Health Perspectives, which has been previously forwarded to the Army by ESC). While burned chaparral may recover faster than clear cut areas, it is not clear that in the long term mechanically cut areas of chaparral would fare any worse than if they were burned. The Army, the Bureau of Land Management, and the US Fish and Wildlife Service should all examine this question and how it pertains to the development of alternative vegetation clearance methods such as the “crush and burn” method cited in both the Track 3 RI/FS and the HMP.

The Track 3 RI/FS provides an excellent opportunity to examine these alternatives. Considering the known health effects of smoke and the Army’s poor track record in containing prescribed burns, there is no reason not to at least reevaluate these methods. In the aftermath of the escaped 2003 burn, no formal failure analysis was conducted and prescribed burning was not compared with other alternatives using the results of the burn. These analyses should not have to wait for the five year review of the ROD to be performed. It is disappointing that they were not here.

FOEJN & Communities around Fort Ord are willing to work with the Army to solve these problems and find a solution that is acceptable to all parties. However, before any meaningful discussions can take place the Army must first begin to accept the reality of prescribed burns: they are:

- a) Not as effective in clearing vegetation as previously thought, and**
- b) Smoke from these burns poses a hazard to public health. Communities want to be dealt with openly and honestly, and while the Army continues to dispute these very clear facts local community members will not feel like they are.**

Response 4: Please see Response to Comment 1. The comment regarding the assumption that some manual vegetation removal is inevitable after a prescribed burn is accurate. Cutting of vegetation after a prescribed burn on an MRS is often necessary for the safety of workers and for the effective operation of MEC detection equipment. Manual and mechanical cutting of maritime chaparral immediately following a

prescribed burn is protective of the seedbank and is consistent with the HMP and Biological Opinions. Cutting alone as a vegetation removal technique is not only unsafe to workers and result in conditions unsuitable for the application of the best available technology for digital mapping, it is also contrary to the HMP and the Biological opinions. The cost estimates provided in the FS present assumptions regarding the level of effort anticipated for manual vegetation removal after a burn based on recent Fort Ord-specific data.

In response to the comment “while burned chaparral may recover faster than clear cut areas, it is not clear that in the long-term mechanically cut areas of chaparral would fare any worse than if they were burned,” the FS summarizes information that supports prescribed burning as the primary vegetation removal method in maritime chaparral that contains several rare, threatened and endangered plants at the site. In addition, the Army refers the commenter to a trends analysis which specifically evaluated the trends in the recovery of maritime chaparral using annual monitoring results of vegetation impacted by prescribed burning, manual/mechanical cutting, and UXO removal at the former Fort Ord. Based on this and other information USFWS concluded that “adequate evidence exists that large-scale mechanical and manual clearing of vegetation, in the absence of fire, is a management option likely to result in the degradation of the Monterey-area maritime chaparral community and loss of key species of concern that occur there.”

The comment regarding prescribed burning creating risk where there was none before is noted. As stated in the FS, the Army and regulatory agencies believe these health risks need to be balanced with health and safety risks to MEC removal workers. Conducting a prescribed burn within the Impact Area MRA is not expected to have significant adverse impacts on the public. The prescribed burn would be conducted under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Burns may cause smoke impacts under most meteorological conditions; however, development of the burn prescription would include assessment of meteorological conditions and design of the prescription to minimize potential impacts to the public. Prior public notification and smoke management while conducting the burn would minimize potential impacts from smoke.

In addition, the following information is provided in response to the comment concerning the 2005 Community Relations Plan and the level of public interest about the 2003 and future prescribed burns. The response below provides additional breakdown on the survey results.

Surveys and interviews for the Fort Ord Community Relations Plan (finalized in 2006) were collected from January through December 31, 2005. In addition to these surveys, seventeen community members participated in the interviews. The number in the parenthesis indicate the number of times each interest was

mentioned in the 200 surveys. Key areas of community interest are identified from these surveys and interviews:

- The presence of unexploded ordnance (UXO) on the former Fort Ord (122)
- The location and impact of contaminated groundwater (116)
- The suitability of property for transfer and reuse (97)
- Soil contamination (90)
- Vegetation burning (85)

In the 2005 survey, respondents who expressed interest in vegetation burning had opinions ranging from opposition to vegetation burning to support for more burns as well as support for burns related to habitat management. The analysis of the survey results in the Community Relations plan did not conclude that most of the community interest was in opposition to the 2003 and the future burns. Other community members participating in this survey also expressed concern about the potential health effects of smoke from vegetation burning associated with munitions and explosives of concern removal activities.

Because of the community interest in the prescribed burns the Army held many special outreach events related to burning that included publication of Community Bulletins sent to over 50,000 Salinas Valley-Monterey Bay addresses, special meetings, as well as phone and email notifications regarding fire status. For the 2003 and 2006 prescribed burns, the Army reimbursed individuals who relocated outside of Monterey County during the fire.

SPECIFIC COMMENTS

Volume 1:

Comment 1: Section 3.5.3.1: It may be better to organize this section by location rather than ordnance. Reorganizing it in this manner would be much more useful to obtain information about the spatial distribution of UXO and MEC.

Response 1: The graphics will be modified to provide a better representation of where different MEC types might be expected based on the MEC sampling and removal data available and historical information. The text will be revised to include a section that describes the distribution anticipated in each of 4 sections of the Impact Area.

Comment 2: Section 4.1.4.2, page 93: The table at the top of this page should be given a title and number. It would also be useful to include examples of Type 1, 2, and 3 munitions in an additional column.

Response 2: The Table will be given a title and number as suggested. Examples of the Type 1, 2, and 3 munitions will also be provided.

Volume 2:

Comment 1: Section 2.3, page 24, Community Involvement: ESC and FOEJN note that these community involvement measures have proven inadequate, as demonstrated by the low public turnout at these Army sponsored events.

Response 1: Community outreach and notification meets or exceeds all CERCLA (Superfund) outreach requirements. The Fort Ord cleanup outreach program continues to look for ways to increase accessibility, provide opportunities for the public to learn about the cleanup and provide a variety of ways for the public to participate.

Various outreach events and community participation (attendance) are included in the Community Involvement Record in Appendix J in the Fort Ord Community Relations Plan. In addition, the Fort Ord newsletters are regularly distributed to numerous businesses and residences in the surrounding Fort Ord communities including churches, schools, restaurants, and grocery stores.

Comment 2: Section 5.1.9: Again we emphasize that any alternative involving prescribed burns is not likely to be acceptable to the public. Statements to the contrary are inappropriate as they assume the public backs a position favorable to the Army's when there is ample evidence they do not. The document should note these objections here.

Response 2: This comment is noted.

APPENDIX F

RESPONSE TO COMMENTS ON THE DRAFT FINAL TRACK 3 IMPACT AREA
MUNITIONS RESONSE AREA REMEDIAL INVESTIGATION/FEASIBILITY STUDY

APPENDIX F

RESPONSES TO COMMENTS ON DRAFT FINAL TRACK 3 IMPACT AREA MUNITIONS RESPONSE AREA MUNITIONS RESPONSE REMEDIAL INVESTIGATION/FEASIBILITY STUDY FORMER FORT ORD, CALIFORNIA JANUARY 26, 2007

Comments from U.S. Environmental Protection Agency (EPA) [February 22, 2007]

GENERAL COMMENTS

Comment 1. On August 8 and November 9, 2006, the EPA provided a series of comments on the Draft Track 3 Impact Area Munitions Response Area Munitions Response Remedial Investigation/Feasibility Study, Former Fort Ord, California. A number of the Army responses to these comments are either insufficient or have not been implemented as stated in the response document found at Appendix A in the Draft Final Track 3 Impact Area Munitions Response Area Munitions Response Remedial Investigation/Feasibility Study, Former Fort Ord, California (hereinafter referred to as the DF Track 3 Impact Area MRA MR RI/FS). The responses and the noted concerns are as follows:

August 8, 2006 comments:

- a. General Comment 3 and Specific Comment 14 on Volume 1 of the DF Track 3 Impact Area MRA MR RI/FS: The responses are acceptable as written, but not implemented as stated. The deficiencies in the responses to these two comments are as follows;**

Responses to General Comment 3: The acronym FFA still has two different definitions – one in Volume 1 and another in Volume 2. Also, the definition of ITRC has not been corrected as stated in the response. The original incorrect definition remains in the Glossary Sources listed in the DF Track 3 Impact Area MRA MR RI/FS. This should be corrected.

Response to Specific Comment 14 on Volume 1: This comment noted that the term “buried” has a different connotation than the term “subsurface” when referring to ordnance material present under the surface of the ground, specifically with respect to how the ordnance came to be located underground. The Army response indicated that the word “buried” would be replaced with “subsurface” in the cited sentence. However, the term “buried” is still used a number of times in the same paragraph when referring to the ordnance material referenced in the cited sentence, negating

APPENDIX F

the effect of the change and reinforcing the confusion caused by the prior use of “buried.” The term “buried” should be replaced with the term “subsurface” throughout Section 3.5.3.2, Vertical Distribution, and at any other use in the document where ordnance material is present below ground and was not intentionally buried.

Response 1a: General Comment 3- The final text will be revised to correct the ITRC acronym as requested. The acronym FFA was changed to Federal Facility Agreement.

General Comment 14 The text will be revised to change the term “buried” to “subsurface” as appropriate.

November 9, 2006 comments:

b. General Comment #1: EPA agrees that the HMP allows for up to 400 acres of prescribed burns and appreciates Army’s response that the prescribed burns will be conducted in stages and consist of several small burns rather than one large burn. However, based on the experience of the last successful burn (50 acres) and the fact that no relocation will be offered for the future burns, EPA believes 100 acre burns would be more appropriate. EPA recommends that the following language be inserted after the second sentence on page 3-6 of the Draft Final FS, under the heading Potential Impacts to the Public: In general, each prescribed burn area will be 100 acres or less unless DTSC and EPA concur via the Implementation Work Plan that a larger burn can be effectively managed (fire control, smoke management, etc.) within the prescribed condition.

Response 1b: The text will be updated to provide additional clarification on vegetation clearance methods.

The Impact Area MRA is densely vegetated; therefore, in order to provide safe access for workers to conduct MEC removals, Alternatives 2, 3, and 4 all require vegetation clearance as a first step. Methods of vegetation clearance for different plant communities at the former Fort Ord were evaluated. The Impact Area MRA is designated habitat reserve, and is primarily covered by Central Maritime Chaparral (CMC), *The Evaluation of Vegetation Clearance Methods Technical Memorandum, Ordnance and Explosives Remedial Investigation/Feasibility Study, Former Fort Ord, California* (Vegetation Clearance Technical Memorandum; *Harding ESE, 2002*) identified prescribed burning as the only method that can be used on a large scale within CMC and Coastal Scrub plant communities.

The Vegetation Clearance Technical Memorandum evaluated several vegetation clearance methods that may be applicable in different plant communities, and identified prescribed burning as the only method that can be used on a large scale

APPENDIX F

within CMC and Coastal Scrub plant communities. Other vegetation clearance methods were evaluated, but their use is allowable on a limited basis only, or further study is required. The major elements of prescribed burning include:

- Preparation of a burn prescription/burn plan outlining the objectives of the burn, burn area, and the range of environmental conditions under which the burn will be conducted; workforce and equipment resources required to ignite, manage and contain the fire; and communication procedures;
- Site preparation, including establishment and maintenance of containment lines;
- Conducting the burn within the range of environmental conditions established in the burn prescription; and
- Follow-up operations to ensure that the fire is fully contained.

Based on past experience and habitat conservation considerations, it is anticipated that prescribed burns would be conducted in stages and consist of several smaller burns, approximately 100 acres in size (actual size could be more or less than 100 acres depending on site-specific considerations) over several days rather than one large burn.

Regularly-maintained roads and fuelbreaks that are accessible by vehicles and fire management equipment currently divide the site into several sections (300 to 500 acres in size). These sections would be further divided by utilizing established roads and trails that can be expanded as temporary fuel breaks (instead of creating brand new fuel breaks through thick vegetation that would involve higher level of effort and potential avoidable habitat impacts). The sizes of the burn areas are contingent on many factors, the most important being the location and condition of major fuelbreaks (well maintained, substantial fuel breaks where a fire could be held from spreading past that location). Other factors considered are topography, slope aspect, fuel type, fuel loading, fire behavior, and the proximity of urban/wildfire interface. The actual size and configuration of burn areas would be determined by the Army fire department in charge. The fire department would determine these parameters to minimize the size and duration of each burn, to best maintain control of the burn, to minimize smoke impacts, to be able to execute the burn within the narrow meteorological window, minding also explosives safety and other technical and practical considerations. The fire department also must select areas to strategically create a buffer between the Impact Area MRA and the surrounding communities to protect the communities from any potential wildfire or fire hazard. Proposed burn areas, containment lines, and supporting rationale would be described in site-specific implementation work plans (anticipated to be prepared for each year of planned cleanup work) that would be submitted for DTSC review and EPA concurrence.

Each contiguous prescribed burn area would not exceed 400 acres (separated by a minimum of 25 acres to allow a mosaic pattern consisting of different age classes

APPENDIX F

of vegetation) unless specifically coordinated with USFWS. Under the HMP, no more than 800 acres would be allowed to be prescribed burned in any given year.

The Army will provide public notification of planned prescribed burns. A prescribed burn will be started only when optimum burn conditions are confirmed. Mobilization of fire management personnel and equipment, and public notification, will occur when optimum burn conditions are reasonably expected. Once mobilized, fire and management personnel, equipment, and supplies may be in place and standing by for several days. Because the Army will be waiting for appropriate atmospheric conditions rather than trying to anticipate them, the Army will not know conclusively until moments before the fire is lit that the burn will occur that particular day. In addition, multiple burn events may be conducted over a period of several days that could be interrupted by one or more days of no burning. Through community notification, the public will be advised of reasonable precautions they can take to minimize exposure to smoke from prescribed burns, such as staying indoors with doors and windows closed, and limiting outdoor activity when smoke is present.

- c. Specific comment 5, 16, and 30 on Volume 2 of the DF Track 3 Impact Area MRA MR RI/FS: The responses are acceptable as written, but not implemented as stated. The deficiencies in the responses to these three comments are as follows:**

Response to Specific Comment 5 on Volume 2: The EPA comment requested that the term “visual surface clearance” be replaced with “surface clearance” to indicate that instrumentation would be used as needed during the removal. The Army response stated that the “surface only removal” would include use of a hand held instrument and this statement would be included in the description of the “surface removal” provided in the document. However, a review of the DF Track 3 Impact Area MRA MR RI/FS found the term “visual removal” used in the document in a number of instances. This is not in accordance with the Army response to the cited EPA comment, and should be corrected as requested.

Response to Specific Comment 16 on Volume 2: The EPA comment requested that the second sentence in Section 3.2.4 should have the words “may be” replaced with the words “will be.” This was not done as requested, and this should be corrected.

Response to Specific Comment 30 on Volume 2: The EPA comment requested that the Army provide information as to whether or not the 10% additional MEC clearance to depth mentioned in Section 4.4.4 would include the existing roads and trails. It also asked that the total acreage of the roads and trails be listed in the text. Neither of these

APPENDIX F

requests was answered in the response to the comment nor in the revised text in the DF Track 3 Impact Area MRA MR RI/FS. This should be corrected.

Response 1c: Comment 5: The text will be reviewed and the term “visual removal” will be changed to “technology-aided surface removal” instead of “surface removal” in accordance with subsequent discussions within the MR BCT.

Comment 16: The text will be modified as requested.

Comment 30: The existing roads and trails will receive a technology-aided surface removal as part of the remedial action in the associated polygon. The roads and trails would also geophysical mapping with the rest of the polygon. If anomalies are detected on the roads and trails they will be investigated and identified MEC will be removed.

- d. Specific Comment 11 on Volume 1 and Specific Comment 2 on Volume 2 of the DF Track 3 Impact Area MRA MR RI/FS: The responses are unacceptable as written. The deficiencies in the responses to these two comments are as follows:**

Response to Specific Comment 11 on Volume 1: The response indicates that there were 28 operational ranges at base closure, but the narrative in the fifth paragraph of Section 3.2, Track 3 Impact Area MRA Munitions Response Site History and Development (page 3-2), states that, “At the time of base closure twenty-nine ranges (numbered 18 through 48) were active or considered operational within the Impact Area [Army, 1992].” This number should be consistent throughout the DF Track 3 Impact Area MRA MR RI/FS.

Response to Specific Comment 2 on Volume 2: The response indicates that the intended terminology was “potentially remaining MEC risks.” However, the subject sentence in the DF Track 3 Impact Area MRA MR RI/FS still contains the phrase “potentially ARARs” instead of the intended terminology. This should be corrected.

Response 1d: The text will be reviewed and references to 29 ranges will be modified to 28 ranges. The text in Section 2.0 of the FS was reviewed again, and was corrected to state “(2) the RAOs, potential ARARs, and land use control guidelines will be considered in the development and analysis of remedial alternatives”.

- e. Specific Comment 13. Volume 1: EPA agrees with the Army that the 150-foot wide fuel break within MRS-16 was a temporary fuel break and served an important function in controlling the burn at MRS-16. EPA**

APPENDIX F

believes that 150-foot temporary fuel breaks are also necessary for the Track 3 burns. Please revise the Report to include 150-foot temporary fuel breaks.

Please respond to the cited deficient responses to the EPA comments on August 8 and November 9, 2006, by providing the additional information requested and/or by modifying the text of the DF Track 3 Impact Area MRA MR RI/FS in the final version thereof as necessary.

Response 1e: Please see Response to EPA Comment 1b.

Comment 2. The DF Track 3 Impact Area MRA MR RI/FS was provided for review in hard copy and on a disk (CD). The pagination between the two different formats varied. As a result, the comments provided in this review are based on the pagination found in the hard copy version of the DF Track 3 Impact Area MRA MR RI/FS. Also, the page numbering protocol was changed in the transition from the draft version to the draft final version. This resulted in some difficulty in tracking and comparing the changes and comment responses, as they are identified primarily by page numbers in the EPA supplementary comments of November 9, 2006.

Response 2: Formatting was lost during the creation of the disk. The electronic version of the document provided on the disk and the hard copy version were compared, and although the page numbers are different, there were no content differences between the electronic copy and the hard copy version.

SPECIFIC COMMENTS:

- 1. Acronym List, page x: The Acronym for the U.S. Naval School, Explosive Ordnance Disposal is listed as “NAVSCOLEDD.” This is incorrect. It should read “NAVSCOLEOD.” Please make this correction. Also, the acronym for cyclotrimethylenetrinitramine is incorrectly listed as “RPX.” It should read “RDX.” Please make this correction on page x and on page 1-1 in the second paragraph of Section 1.0, Introduction.**

Response to Specific Comment 1: The acronym will be revised as requested.

- 2. Glossary, page xii: In the definition for Explosive Soil, Subparagraph (b) contains a comma between the word “Lead” and the word “Azide.” This comma is in error and results in the primary explosive Lead Azide being improperly described and Lead being improperly listed as a primary explosive. Please remove the cited comma.**

Response to Specific Comment 2: The correction will be made as requested.

APPENDIX F

3. **Table B-8, MRS-15 BLM, Draft 3 Impact Area Munitions Response Area, Munitions Response Remedial Investigation/Feasibility Study, Former Fort Ord, California, pages 1 through 10 of 10: The title of this table is missing the words “Final” and “Track.” The title should read, “Table B-8, MRS-15 BLM, Draft Final Track 3 Impact Area Munitions Response Area, Munitions Response Remedial Investigation/Feasibility Study, Former Fort Ord, California.” Please make this correction.**

In addition, on page 3 of 10 of the subject table, one of the items listed in the column “MM Item Description” is described as “CLAYMORE CLACKER WITH WIRE (Model Unknown).” The term “Claymore Clacker” is a munitions slang term and is not the correct nomenclature for the items found. Please replace the term “Claymore Clacker” with “Firing Device, Antipersonnel Mine, Electric, M57,” which is the nomenclature for the firing device used with the M18A1 antipersonnel mine (also known as the “Claymore” mine).

Response to Specific Comment 3: The “Claymore Clacker” was identified in 1997 by EOD in response to a call from BLM personnel who were conducting erosion control activities in the Impact Area. Based on review of the Incident Report, the item was reclassified as range related debris and was removed from the data table.

APPENDIX F

Comments from California Department of Toxic Substances Control (DTSC) [March 9, 2007]

Comment 1. The document uses data from prior removal actions conducted mostly outside the Impact Area boundary. The Ranges 43-48 Interim Action Munitions Response data is extensive, but the data have not been validated by Quality Assurance. A large portion of acreage located within the Impact Area does not have adequate data collected or the data was collected without the benefit of Data Quality Objectives being in place at the time. The Impact Area has many unknowns regarding the density and location of Munitions and Explosives of Concern (MEC) that must be fully evaluated. The Feasibility study not be based on data that do not give an accurate representation of the entire site.

Army Response 1: The Army acknowledges that the available characterization data is limited to surface removals over a portion of the site, subsurface removal actions primarily on roads and trails, and site walks conducted as part of the basewide range assessment; however the Army maintains that there is sufficient data to prepare a risk assessment using the Fort Ord Risk Protocol and to prepare a feasibility study for removal of MEC. Much of the subsurface data was gathered during fuel break and roads and trails removal actions. The fuel breaks cross east west and north south and are similar to running transects across the site. The fuel break data in conjunction with the surface removal data, historical records, and basewide range assessment data do provide data from across the Impact Area and indicate that MEC is present throughout the Impact Area. Based on the constraints of the HMP it is not feasible to collect additional characterization data to further refine characterization areas. Much of the Impact Area not previously visited, sampled, or cleared is within thick maritime chaparral which would require burning to access. Once burned, the area could not be burned again to facilitate removal for more than a decade. This would greatly impact the ability to complete a timely characterization or removal action. To address concerns raised on the characterization of the site, the report will be revised to better represent the current conceptual site model and the probable distribution of MEC based on historical documentation and sampling and surface and subsurface removals conducted within the Impact Area. In addition, the historical sampling, removal actions and site walks will be illustrated on additional plates.

DTSC Response: DTSC does not agree with the Army rationale used in evaluating the distribution of MEC throughout the Impact Area. Utilizing the fuel break data only indicates MEC found in fuel breaks and trails and are not

APPENDIX F

a substitute for characterizing within each defensible polygon. Transects can be useful to evaluate MEC distribution for large areas, when adequate characterization is not complete; however, transects require an equally spaced number of data points within the transect line to accurately represent the site characteristics. The data points from fuel breaks, roads and trails are located several hundreds and/or thousands of feet apart. Please provide information as to the spatial distribution and location of MEC along these transects. If this information has been added to the Draft Final document, please indicate the location of this text.

Response 1: Data was collected along the entire length and removal width of the roads and trails where removal actions were completed. The data shown on Plates 6 through 13 that show where a MEC or munitions debris item was found during removal actions. Plate 2 shows the grids that were 100 percent surveyed as part of each of the investigation and removal actions and the areas where visual surface removals were performed. These grids represent the “transect” that was sampled. Additional information on the nature of the roads and trails removals and the visual surface removals will be added to Section 3.5.3 prior to the discussion of the nature and extent of munitions and explosives of concern.

Comment 2: DTSC recommends that the Impact Area be divided into operable units of a more manageable size. The “plug-in” concept may be appropriate, in this case. One possibility would be to use the existing defensible polygons as area boundaries. Once the first of these areas is surface cleared, then the evaluation of that area can occur. The MEC found on the surface should guide the additional investigation and cleanup work. The cleanup work should be based upon the amount of MEC found, proximity to popular trails and population, the explosive hazard of the MEC items, etc. Characterization of each area in this manner will provide more meaningful data versus a generalized assumption of unknowns based on incomplete data. The BCT can learn from each subsequent area investigated and cleaned up. The intensity of the investigation and cleanup can be modified as the areas are addressed.

Army Response 2: The response actions will be conducted in stages as described in the FS. A site specific implementation work plan will be developed for each phase of work. The plan will describe the anticipated distribution of MEC, the vegetation clearance plan, and the method for completion of the response. It is anticipated that following the surface removal, the digital geophysical scan will be completed and the data will be presented to the BCT. The BCT will review the data and determine if additional actions (subsurface removal) are necessary. The review will include an evaluation of whether additional actions are consistent with the ARARs including the HMP and Biological Opinions. The text of the FS will be revised to include additional information on this proposed approach. A Technical Memorandum will be prepared documenting the decision reached

APPENDIX F

in the BCT. To avoid impacts to the rare, threatened and endangered species seed bank, completion of the TM will need to be expedited to allow any additional actions to be executed before the next growing season. Additional details on the BCT review step will be added to the FS. In general, factors that would be considered when determining whether additional action, such as subsurface removal are required, include, but are not limited to:

- Type of MEC encountered and danger associated with the MEC
- Proximity to potential receptors
- Density of items
- Consistency with ARARs.

The text of the FS will be revised to include additional information on this proposed approach.

DTSC Response: DTSC's position is that response action stages (including prescribed burns) should be conducted as parcels of approximately 100 acres or less. The Army should also state that there will be an evaluation of whether additional actions are consistent with the ARARs, the HMP, Biological Opinions, future land use and adjacent parcel use. The Technical Memorandum must be a primary document and be subject to dispute resolution pursuant to the FFA and as such include input from the public. The BCT does not provide a forum for public involvement. The additional actions must have performance standards included in the Record of Decision. The BCT review step process could not be found in the FS text. Please indicate where the additional information on the proposed approach for determination of further action is located within the FS.

Response 2: The process for recommending additional removal while the cleanup is already in-progress was developed with BCT input, and was described in the Draft Final FS under Remedial Alternative 4 (Section 4.4.4). In response to the comment above, the process is further updated as follows.

The Remedial Design/Remedial Action Work Plan (RD/RAWP) and site-specific work plans will be FFA primary documents. Under Alternative 4, areas proposed for subsurface MEC removal (e.g. "buffer") would be identified in the site-specific work plans. During the remedial action, based on the results of the surface removal and digital mapping, if additional work (e.g. subsurface removal) is proposed, the Army would submit to EPA and DTSC a technical memorandum outlining the proposed work and supporting rationale, and request their concurrence. In general, factors that would be considered when determining whether additional action, such as subsurface removal, are required, include, but are not limited to:

- Type of MEC encountered and danger associated with the MEC,
- Proximity to potential receptors,

APPENDIX F

- Density of items, and
- Consistency with ARARs.

Each technical memorandum would be an addendum to the site-specific work plan, therefore associated with a primary document and is disputable under the Fort Ord FFA. To avoid impacts to the rare, threatened and endangered species seed bank, completion of the technical memoranda will be expedited to allow any additional actions to be executed before the next growing season. Therefore, the regulatory agencies would respond in writing within 14 days of the Army's request for concurrence. Absence of such correspondence after 14 days would be considered concurrence by the regulatory agency. Each technical memorandum and associated correspondence would be made available to the public in the Administrative Record.

Please also see response to EPA General Comment 1b for discussion about the anticipated sizes of prescribed burns.

Comment 3. The document states that the Army will clear MEC to depth in a 200 foot "buffer zone" around each defensible polygon. DTSC's position is that the width of this "buffer zone" may not be adequate to be protective of proposed nearby development, including residential. Please provide more information regarding how proposed residential and commercial development will be protected during prescribed burns and Munitions Removal actions.

Army Response 3: It is anticipated that temporary fuel breaks will be cut and surface cleared around each burn area prior to burning. This could include cutting a wider fuel break along the development boundary prior to conducting the burn. In addition, safety set back distances will be identified that will protect the public during vegetation clearance activities. The details of these measures will be documented in the Implementation Work Plan. In addition, the Army proposes a removal to depth in a 100 foot wide zone adjacent to development areas to reduce the potential impacts of wildfires on the surrounding area.

DTSC Response: A 100 foot wide removal to depth adjacent to development areas is not protective. There will most likely remain a large number of MEC items within the subsurface beyond the 100 foot wide removal to depth areas. The fencing adjacent to the proposed development areas currently is four strand barbed wire enhanced by razor wire and signage. Proposed development adjacent to the Impact Area will significantly increase the probability of trespass incidents. A 6 foot high chain link fence topped with three strand barbed wire should be erected to replace the current fence adjacent to development areas. As we understand it, the proposed development areas are located in an arc beginning at MRS-15 SEA.04 southward to include MRS-15 SEA.03, MRS-15 SEA.02, MRS-15 SEA.01, MRS-15DRO.01, MRS-15DRO.02, MRS-15MOCO.01, MRS-46, South Boundary Road to approximately the

APPENDIX F

intersection of Darwin and Orion Road. The fence construction should be adjusted to new or changed development areas.

Response 3: The fencing for the Impact Area MRA will be selected, constructed and maintained based on reuse and the potential for MEC risks. For this FS, it is assumed that existing fencing surrounding the Impact Area (4-strand barbed wire fence w/concertina wire in some portions) and signs would be maintained during MEC removal. In addition, temporary fencing may be constructed and maintained as necessary for public safety for the duration of the MEC removal around the perimeter of each of the areas where MEC remedial actions are conducted. The design of the perimeter fence may be modified based on site-specific considerations.

Comment 4. In its preferred remedy, the Army proposes to provide a surface clearance and limited (10 percent) clearance to depth for most of the Impact Area. Because these cleared areas will be subject to erosion and other soil moving forces, frequent “operation and maintenance”, in the form of additional surface clearance, will be needed. If the areas are cleared to depth, this additional surface clearance will not be needed. Please include this analysis in the Feasibility Study.

Army Response 4: The description and estimated costs for Alternative 2 in the FS will be revised to include a post-removal erosion survey and monitoring for each area. The initial survey within 1 year of MEC removal would be performed to identify areas where erosion may be occurring and MEC may be present at the surface. Follow up monitoring would be conducted yearly until the vegetation grows back. Any areas where erosion and/or MEC were identified would then be placed in a monitoring program and additional surface removal would be conducted as appropriate.

DTSC Response: DTSC agrees with the post-removal erosion survey and monitoring proposed by the Army. In addition, monitoring of subsequent burns, including a surface clearance after each burn, will be required to ensure that MEC has not been exposed. Recent observations at Ranges 44 Special Case Areas indicates that Munitions Debris, and the potential presence MEC items, will require continued operation and maintenance until vegetation growth renders the areas inaccessible. In addition, the Army must provide a 1000 foot clearance to depth adjacent to the development areas referred to in the previous comment. This would account for approximately 700 acres cleared to depth. This clearance would provide a wider “buffer” safety zone for the proposed development areas.

Response 4: As described in the Draft Final FS, the Army plans to complete a MEC removal to depth within the 100 foot buffer zone around the border of the Impact Area that is adjacent to developed areas. However, the width of the buffer could be widened based on area-specific conditions that will be specified in the site-specific

APPENDIX F

Remedial Action Work Plan. The Final FS will be revised accordingly for clarification.

As described in the Draft Final FS, annual surface reconnaissance/monitoring will be conducted following the prescribed burns and MEC removal actions by the Army until vegetation regrowth is sufficient to stabilize the site. In addition, after the property is reassigned UXO-qualified personnel will be available for long term support of reuse activities. The Final FS will be revised to clarify that after property transfer, the UXO-qualified personnel could perform additional surface reconnaissance if/as needed following prescribed burns that may be conducted by the property recipient.

Comment 5: The Conceptual Site Model assumptions are based on limited sampling and transect surveys in the Impact Area. We question whether there is enough information to construct the Conceptual Site Model.

Army Response 5: The conceptual site models presented in the RI/FS are based on the existing historical information (maps, aerial photographs, reports, and range SOPs) and the surface and subsurface removals completed within and adjacent to the site boundaries. The Army maintains that this is sufficient information to construct a CSM. The CSM may be refined as new information becomes available from remedy implementation.

DTSC Response: The Conceptual Site Model must be changed as data are generated. The proposed remedy could be changed as additional stage specific data is obtained.

Response 5: As stated in the Army Response, it is anticipated that the conceptual site model will be revised as additional data are reviewed.

Comment 6. Volume 2, Feasibility Study, Pages 19-21. Please revise the first sentence in the last partial paragraph to read: "...Section 1472, which allows an owner of ..."

Army Response 6: The text will be revised as suggested.

DTSC Response: Response is accepted. In addition, please correct the Section quoted as 1472 to read Section 1471.

Response 6: The text will be revised as requested.

Comment 7. Please revise the first sentence in the first full paragraph on Page 20 to read: "These regulations specify that a Land Use Covenant..."

Army Response 7: The text will be revised to be consistent with the regulations.

APPENDIX F

DTSC Response: Response is accepted.

Response 7: Comment noted.

Comment 8. Please revise the last partial paragraph on page 20 to read: “For sites requiring land use covenants, DTSC policy and Title 22, Division 4.5, Chapter 39, Section 67391.1 require that the property owner...”

Army Response 8: The text will be revised to be consistent with the regulations.

DTSC Response: Response is accepted.

Response 8: Comment noted.

Comment 9: Please revise the last paragraph on page 21 to read: “...would be described in further detail in the Record of Decision and in the Land Use Control....”

Army Response: The text will be revised as suggested.

DTSC Response: Response is accepted.

Response 9: Comment noted.

Comment 10: Please add a final sentence to last paragraph on page 21: “The Army intends that this will comply with Title 22, Division 4.5, Chapter 39, Section 67391.1(e)(2).”

Army Response 10: The text will be revised as suggested.

DTSC Response: Response is acceptable with inclusion of the following text. The Army will assure that other mechanisms, such as the BLM Master Plan and agreement between DTSC and BLM will ensure that future land use will be compatible with the levels of MEC which remain on the property. Refer to Title 22, Division 4.5, Chapter 39, Section 67391.1(e)(2). In addition, Title 22, Division 4.5, Chapter 39, Section 67391.1(h) states that responsible parties, facility owners or operators, or project proponents involved in land use covenants to pay all costs associated with the administration of such controls.

Response 10: The Final FS will be revised to include the information regarding Sec.67391.1(e)(2) and clarify that because the property transfer will be from one

APPENDIX F

federal agency (the Army) to another federal agency (BLM), the land use covenant described in Section 67391.1(h) does not apply.

Comment 11: Special Case Areas (SCAs) and Pending Areas in the Impact Area have not been fully evaluated. The Interim Action Munitions removal at Ranges 43-48 identified approximately 264 acres of SCAs and Pending Areas. The Army states that Ranges 43-48 can be assumed to be the worst case example of what might be in the Impact Area, so it is realistic to assume that other areas within the Impact Area will also be designated as Special Case or Pending Area. How will the Army address SCAs?

Army Response 11: It is possible that additional areas of high anomaly density will be identified within the Impact Area. As described in response to EPA Comments 1 and 2 and DTSC Comment 2, a process will be developed to evaluate areas after the surface removal is completed to determine whether additional removals are required. High density areas identified in the future would be addressed through this process.

DTSC Response: This process should be developed and provided to regulatory agencies such as BLM, Cal Fish and Game and US Fish and Wildlife Services for review, prior to completion of the Record of Decision. Any documents provided post-ROD to evaluate areas after surface removal must be provided as a primary document, subject to dispute resolution pursuant to the FFA.

Response 11: Please see Response to Comment 2 above. The process for recommending additional removal while the cleanup is already in-progress was developed with BCT input, and was described in the Draft Final FS under Remedial Alternative 4 (Section 4.4.4), and was reviewed by USFWS, BLM, and CDFG. .

Comment 12: The current fence and signage is a deterrent that cannot be considered adequate to protect the community. The Army states that the fences and signs will be maintained in addition to security patrols. Given that significant additional human population will move to the developments adjacent to the Impact Area, additional site security measures (enhanced fencing, patrols, etc.) will likely be needed. Please elaborate on how these security measures will be enhanced.

Army Response 12: Site security will continue as an Army function until the property is transferred. The site security program is updated as necessary to reflect any additional security measures that may be needed in the future to ensure the safety of nearby populations. At the time the property is transferred or reassigned, it is expected that a site security plan will also be prepared by the property recipient and that the agencies will have an opportunity to review and comment on the plan. The text will be revised to

APPENDIX F

indicate that the site security plan will be modified as necessary due to changes in the nearby human populations.

DTSC Response: Site security is part of the remedy and needs to be evaluated in the Feasibility Study. Army states that site security is a retained function until the property is transferred; however, the Bureau of Land Management (current proposed recipient) has not indicated a willingness to accept this responsibility. Without a confirmed site security program, the proposed remedy does not satisfy the NCP criterion of long term effectiveness. How will the Army assure that site security is continued? Will BLM be signatory to the Record of Decision, accepting this responsibility?

Response 12: The Draft Final FS described the remedial alternatives that all include maintenance of the existing perimeter fence as land use control components. The Final FS will be revised to include the additional land use control components of security (law enforcement) to reinforce the access management feature of the existing land use controls. Area-specific aspects of implementation will be decided at the time of property reassignment. The Army, EPA, and DTSC will be signatories to the ROD under the FFA; the future property recipient (BLM) is not a signatory to the ROD under the FFA.

Comment 13: Volume 2, Feasibility Study, Section 3.3.1, Vegetation Clearance via Prescribed Burning. The Army lists additional vegetation clearance activities that have been studied or require further study, such as Crush and Burn; however, for the purposes of this Feasibility Study the Army assumes that prescribed burning will be implemented using a phased approach of burns and MEC removal of up to 800 acres per year of the 6,560 acre Impact Area. Each prescribed burn would not exceed 400 acres with a minimum of 25 acres of separation. Previous discussing in BCT and SMART meetings, following the 2003 prescribed burn at Ranges 43-48, have focused on conducting more frequent smaller (100 acres or less) burns per year. Please explain the rationale for the increase in acreage.

Army Response 13: Please see response to Supplemental EPA Comment 1.

DTSC Response: DTSC does not agree with this response. A smaller burn of around 100 acres per event is required.

Comment 13: Please see response to EPA General Comment 1b.

Comment 14: Volume 2, Feasibility Study, Section 3.3.2.1.2 Removal to Depth and Section 3.3.2.3 Digital Mapping of Anomalies. Section 3.3.2.3 states that a digital geophysical survey will be provided to the future recipient, yet Section 3.3.2.1.2 states that a digital geophysical survey may not be conducted due to site conditions and difficult terrain features that would prevent equipment

APPENDIX F

use. Please discuss how will these areas be addressed in the future to support reuse, since MEC can be expected in shallow soils below the surface?

Army Response 14: The text will be revised as suggested to clarify that any areas where a digital survey can not be conducted will be noted in the record provided for planning purposes for future reuses, and additional long term management measures will be evaluated for the area.

DTSC Response: Response is accepted.

Comment 14: Comment noted.

APPENDIX F

Comments from Department of Toxic Substances Control, Brian K. Davis, Ph.D., Human and Ecological Risk Division, dated March 7, 2007

COMMENTS

Comment 1. DESCRIPTION OF THE SUBJECT AREAS.

- A. This report only addresses part of the Impact area. Our comments on the draft report (*DTSC, 2006*) stated that it was difficult for a reader to determine what is included and what is excluded. The description of the subject areas has been greatly improved, both in the text and in Plate 2.

Response 1a: Comment Noted.

- B. The text in Section 1.0 states that the portion of the Impact Area addressed in this report is the “*Habitat Reserve in the Installation-Wide Multispecies Habitat Management Plan (HMP) (Plate 2)*”. Based on the Responses to Comments (Responses 2A and 2B on page 39 of Appendix E), the Habitat Reserve is that portion of the Impact Area which will be transferred to the Bureau of Land Management (BLM). Thus, the Munitions Response Area (MRA), the Habitat Reserve, and the land to be transferred to the BLM all three appear to be synonymous. If this is correct, it should be stated explicitly. If it is incorrect, then please clarify the definitions.

Response 1b: The Final RI will be modified to clarify this issue. There are Habitat Reserves inside the Impact Area that are not being transferred to BLM and Habitat Reserves outside of the Impact Area that will be transferred to BLM. A statement will be added indicating that the Impact Area MRA only includes the portion of Habitat Reserve that is identified to be transfer to BLM and is located within the historical Impact Area. Please see Plate 2.

- C. The text in Section 3.1 lists areas that are excluded from the Impact Area MRA. One of the exclusions is “the Habitat Reserve parcels”. This appears to contradict the text in Section 1.0 quoted above.

Response 1c: The text will be modified as discussed above in Response 1b.

- D. The response (page 40 of the Responses to Comments in Appendix E) to our Comment 2 E (*DTSC, 2006*) states that “A different color will be used for the fuel breaks [in Plate 2] so they stand out.” The term “Fuel Breaks” continues to appear in the legend for Plate 2, but now there is no color associated. The locations of the “Fuel Breaks” remains unknown.

APPENDIX F

The locations of the “Fuel Breaks” are also ambiguous in other plates (e.g. 3, 4, 7, 8).

Response 1d: There are two types of fuel break removals shown on Plate 2. The dark blue represents the four-foot removal portions of the fuel break. The white (no color) grid pattern represents areas where only a surface removal was completed. The legend shows these patterns under the heading “Fuel Breaks”

E. Our comment 2 F noted that the discussion of the locations of the firing ranges (Section 2.2.1) incorrectly reference Plate 2. The response (page 40 of the Responses to Comments in Appendix E) states that the reference will be changed to Plates 3 and 4. Instead, the discussion of the firing range locations has been deleted.

Response 1e: Plates 3 and 4 are referenced in Section 2.2.1 (end of first paragraph). This paragraph has the discussion on the location of the range fans. A second paragraph was added to Section 2.2.1 which contains additional descriptive information about the Impact Area MRA.

Comment 2. SITE CHARACTERIZATION. Our Comment 4 (DTSC, 2006) noted that the site characterization is based on only 33% of the total 6560 acres in the impact area for surface removal and only 405 acres for subsurface removal. Furthermore, most of the 405 acres are outside the area addressed in this report. Therefore, the site characterization on which the risk assessment is based is tenuous. The response (pages 41-42 of the Responses to Comments in Appendix E) argues that the density of high explosives in the area on which the risk assessment was based “...is expected to be one of, if not the highest, in the historical Impact Area...” The response also argues that the risk for other areas “...would still be an E [the category with the most severe risk] based on the presence of some Type 3 items.”

It is true that the Fort Ord Protocol is structured so that the risk from MEC for a particular area is characterized by a letter ranging from A to E. Therefore, unlike the open ended risk estimates for risk assessment of hazardous chemicals, an area cannot receive any worse rating than a letter E.

Nonetheless, we continue to question the premise that risk assessment can be based on sample data from outside the area of interest, with assumptions about the outcome if data from the actual area of interest had been used. It is our opinion, as risk assessors, that the application of such an assessment is questionable. Ultimately, the purpose of risk assessment is to provide useful information for risk management. The risk managers for this project will have to determine whether this risk assessment provides sufficient information for decision making.

APPENDIX F

Response 2: As stated in the previous response, the rationale for using the Ranges 43-48 data was specifically discussed by the BCT when its use was approved. The risk assessment included in the Track 3 RI/FS provides useful information that can be utilized to construct and evaluate remedial alternatives, which is its intended purpose.

Comment 3. DATA QUALITY.

A. Our Comment 5 (*DTSC, 2006*) discussed issues with respect to data quality. We noted that Data Quality Objectives (DQOs) are not mentioned in Section 4.1.1. The response (page 43 of the Responses to Comments in Appendix E) acknowledges that there were no DQOs for the Munitions Response activities. The response states that “The QA/QC and contractual requirements fulfill the same purpose as DQO sections in HTW work plans.” We do not agree. DQOs serve a broader function than QA/QC and contractual requirements.

Response 3a: The Army agrees that DQOs serve a broader function than QA/QC and contractual requirements; however, as stated above, the BCT discussed and approved the use of the Ranges 43 through 48 data set for performing the risk assessment.

B. Our Comment 5 (*DTSC, 2006*) requested an explicit statement of whether the BRAC Cleanup Team (BCT) has evaluated the QC/QA. Our comment was that if there was an evaluation, its conclusions should be summarized and a reference to document the BCT decisions should be provided. The response lists documents that were reviewed by the BCT, but doesn’t address the BCT’s evaluation of the QC/QA.

Response 3b: QA and QC of munitions response work are typically documented in work plans and after-action reports. These documents are provided to EPA and DTSC for review and comment. In addition, the agencies reviewed the RI/FS that described the data used, QA/QC of the work from which data was generated, and how the data was used and evaluated. Various BCT decisions that have been made throughout the development and review of the RI/FS are documented in meeting minutes and e-mails; that information is on file with the Army and has been provided to the respective agency remedial project managers.

C. The questions about DQOs and QC/QA need to be answered. During the development of the Fort Ord Ordnance and Explosives Risk Assessment Protocol (*Malcolm Pirnie, 2002*), the team identified the importance of DQOs. It was recognized that some investigations and removals were

APPENDIX F

done without DQOs. Under those circumstances, the Protocol accepts the surrogate use of QC/QA with BCT approval.

Response 3c: As stated above in Response to Comment 3A, the BCT approved the use of this data set for preparation of the conceptual site model and the risk assessment. Data quality objectives will be described in the Remedial Action Work Plans for future cleanup activities so that post-remediation risk can be assessed.

Comment 4. CONSERVATISM

A. Our Comment 6 (*DTSC, 2006*) discussed issues with the repeated characterization of the risk assessment for MEC as “conservative” throughout the report. The responses to Comment 6 indicate that the Army continues to believe that the risk assessment is “conservative” and that the use of data from these ranges provides adequate risk assessment information. The representativeness of the data is a basic question (Comment 2).

Response 4a: As stated in response to comments on the Draft report, the Ranges 43 through 48 is likely more representative of the Impact Area than the limited road and trail removal data and the surface removal data. The road and trail removal data were collected along established travel paths that were likely cleared throughout the use of the Impact Area to allow safe travel and the remaining data sets are primarily surface only data.

B. We noted that the description of the data Ranges 43 through 48 evolved from careful wording in Section 4.1.1, through looser wording in Section 4.1.5.1, and finally resulting in overstated wording in the Conclusions (Section 4.4). The response is “The text will be revised to use consistent terminology throughout the report.” In fact, the text in Section 4.1.5.1 was revised to the careful wording in Section 4.1.1. Unfortunately, the overstated wording in the Conclusions remains unchanged.

Response 4b: The text in Section 4.4 will be modified as requested.

Comment 5. FUTURE LAND USE. Our Comment 8 (*DTSC, 2006*) identified inconsistencies in the descriptions of future land use. Section 3.6.2 is titled “Identified Reuse”. It identifies seven categories of future land use identified for the Bureau of Land Management areas. The seven categories are somewhat different from those listed in Section 3.6.2 of the earlier version of this document. Of particular note is that “Oil/gas/mineral management” appeared on the previous list but is absent on the current list. Please account for the changes in the list. If these represent changes in future land use

APPENDIX F

between the previous version and the present version of this document, are additional changes in land use likely in the near future?

Response 5: Since base closure, the Army has been coordinating with BLM regarding the management of habitat reserve within the former Impact Area. The 1995 SUMP and 1997 HMP outline agreements on conceptual reuse and management of the Impact Area based on MEC cleanup expectations at the time. Since then, BLM has provided several updates on its plans for reuse and habitat management. These documents include the 2004 draft Proposed Management Plan, 2006 Proposed Resource Management Plan/Final Environmental Statement, and 2006 draft HCP (provided as part of the BLM comments to the draft Track 3 MR RI/FS). The Army recognizes that detailed plan for managing the habitat reserve in the Impact Area may change as new information becomes available during the HCP process. However, this RI/FS considers all currently available information in order to construct a remedial alternative that ensures habitat management requirements of the HMP/HCP can be implemented within the Impact Area habitat reserve. The text of the draft final RI/FS was revised to include additional information on the SUMP as well as the draft HCP which replaces the Draft BLM 2004 plan. The deletion of oil and gas management as a proposed activity was based on the draft HCP provided by BLM. It is not anticipated that modifications to the HCP will result in changes to the proposed site reuse.

Comment 6. RECEPTORS. Our Comment 9 (*DTSC, 2006*) discussed receptors. The response to 9 D states “The text will be revised to identify the possibility that construction may occur following initial development, but would not be expected to be as intensive as the initial development phase.” Unfortunately, no revision was done to this text.

Response 6: The text will be modified as suggested.

Comment 7. ECOLOGICAL RECEPTORS AND MEC

A. Our Comment 10 (*DTSC, 2006*) discussed risk assessment for potential harm to ecological receptors from MEC. Whether it is necessary to evaluate ecological receptors was not discussed in the development of the Fort Ord Ordnance and Explosives Risk Assessment Protocol (*Malcolm Pirnie, 2002*).

Response 7a: Comment noted.

B. The response to Comment 9 is that “Observational data will be provided to support the statement [that risks are expected to be low].” The text in

APPENDIX F

Section 4.1 has been expanded and now includes the following statements: (1) “Plant and animal communities appear to be healthy.” and (2) “No evidence has been observed that indicate ecological receptors are being impacted by physical hazards associated with MEC. The site was used as a multi-range impact area for over 80 years, yet it still supports high diversity of plants and animals, including species considered rare, threatened and endangered.”

As a general matter, such anecdotal statements are not particularly useful for ecological risk assessment. The observations are attributed to “onsite personnel”. Whether plant and animal communities are healthy requires some investigation by a qualified biologist. This also applies to conclusions about the level of diversity.

We are not recommending that an assessment for ecological receptors be added to this report. We do recommend that any statement about ecological receptors should be defensible. We suggest deletion of both the anecdotal statements and the statement that the risks are expected to be low. The fact that the Fort Ord protocol doesn’t include ecological receptors and that the BCT decided that such assessment wouldn’t be done appears to be all that can be said.

Response 7b: The Army appreciates the clarification of the previous comment on this matter. However, to be responsive to other commentators, a general statement about the level of risk to ecological receptors was added to the report. Based on many years of site experience, the presence of MEC in the Impact Area MRA does not appear to be a concern in terms of physical risks to ecological receptors. Several iterations of biological resource evaluations and many years of monitoring show that the ecological environment in the Impact Area MRA is healthy and thriving. In fact, the USFWS has designated the entire Impact Area MRA as critical habitat necessary for the continued existence of Monterey spineflower, a federally threatened annual plant.

C. Our Comment 10 (*DTSC, 2006*) requested a reference to document the BCT concurrence with excluding ecological receptors. The response states that this decision was made in an August 30, 2005 meeting. Are there meeting minutes and do the minutes document the decision?

Response 7c: Various BCT decisions that have been made throughout the development and evaluation of the RI/FS are documented in meeting minutes and e-mails; this information is on file with the Army and has been provided to the respective agency remedial project managers.

APPENDIX F

Comment 8. AFTER ACTION RISK ASSESSMENT.

- A. Our Comment 11 (*DTSC, 2006*) requested that the report state explicitly that both after action risk assessments are hypothetical, based on assumed actions and assumed results. This was marginally addressed by inserting the word “hypothetical” in the first sentence of Section 4.1.4.2.**

Response 8a: Additional text will be added to clarify why the results are hypothetical.

- B. Our Comment 11 also asked for clarification of the statement in Section 4.1.4.2 that “The use of a ‘6’ for receptors below 1 foot and use of a ‘1’ for MEC below ground surface is based on BCT concurrence for use of this assumption for the Track 2 Parker Flats site.” The response states that “The text will be modified to make the score selection more clear.” Unfortunately, the text is unchanged.**

Response 8b: Additional text was provided in the Draft Final RI/FS in Section 4.1.4.2. The text addressed the rationale for not using a score of “1” for density and depth for all receptors including those expected to intrude below 1 foot.

- C. Our Comment 11 also asked for a reference to document the BCT concurrence with the choices of parameters. The response states that concurrence was received following discussions with the BCT on June 26, 2006. Please document the form of this concurrence. If it was written, please document that.**

Response 8c: The concurrence with the choice of parameters was discussed in a phone conversation between the Army and DTSC on June 29, 2006. The results of this phone conversation were then documented in a July 3, 2007 email.

- D. The responses to Comment 11 illustrate the extent to which these risk assessments are hypothetical. The utility of the results of these risk assessments is questionable.**

Response 8d: The Army disagrees that the utility of the results of these risk assessments is questionable. The data from Ranges 43 through 48 that were used to prepare the risk assessment provide a conservative data set for evaluating risks. The risk assessment results are qualitative and only one factor considered in preparing the FS. As part of the post remediation evaluation of the site, it is anticipated the risk assessment will be reviewed and modified as appropriate using the data set from the completed removal action to obtain a more accurate post remediation risk score.

APPENDIX F

CONCLUSIONS

Comment 1. The Responses to Comments in Appendix E state that certain changes will be made in the document. Some of these changes have been made in the current document and some have not been made (see Comments 1, 4, 6, and 8).

Response 1. The changes related to Comment 1 and 8 were made. The changes related to Comments 4 and 6 will be provided in the Final Report.

Comment 2. Numerous decisions within the document are justified BCT concurrence. It is important that BCT concurrence be documented. Several of the responses to comments refer to meetings or agreements in other settings, but fail to state whether there are minutes or correspondence or any form of documentation, and if there is documentation, where it can be accessed.

Response 2. Various BCT decisions that have been made throughout the development and evaluation of the RI/FS are documented in meeting minutes and e-mails; this information is on file with the Army and have been provided to the respective agency remedial project managers.

Comment 3. The adequacy of site characterization remains a concern. We remain skeptical about the premise that baseline risk assessment can be based on data from outside the area of interest, with assumptions about the outcome if data from the actual area of interest had been used. It is our opinion, as risk assessors, that the application of such a baseline assessment is questionable.

Response 3. Please see response to Comment 2 above.

Comment 4. Two “After Action Risk Assessments” were conducted. Both are hypothetical, based on assumptions about future clearance of MEC. From the point of view of risk assessment, the application of assessments based on hypothetical results is also questionable.

Response 4. Comment noted.

Comment 5. Ultimately, the purpose of risk assessment is to provide useful information for risk management. The risk managers for this project will have to determine whether the baseline risk assessment and the “After Action Risk Assessments” are adequate for decision making.

Response 5. The Army believes that the Baseline and After Action Risk Assessments are adequate for decision making.

APPENDIX F

Comments from Regina Donohoe, Ph.D., Staff Toxicologist, Patty Velez, Staff Environmental Scientist, California Department of Fish and Game, Office of Spill Prevention and Response, Resource Assessment Program [March 16, 2007]

INTRODUCTION

The California Department of Fish and Game, Office of Spill Prevention and Response (DFG-OSPR) received the subject document on January 29, 2007. The document was prepared for the U.S. Department of the Army (Army) by MACTEC Engineering and Consulting, Inc.

BACKGROUND

The Impact Area occupies approximately 8,000 acres in the southwestern portion of Former Fort Ord, Monterey County. A variety of unique habitat types, including central maritime chaparral, and special status species are present. The Impact Area was used for live fire training exercises with a variety of weapons. The Draft Final Track 3 Impact Area, Munitions Response Area (MRA), Munitions Response Remedial Investigation/Feasibility Study (RI/FS) addresses the physical or explosive risks from munitions and explosives of concern (MEC) in the portion of the Impact Area that is designated as habitat reserve in the Installation-Wide Multispecies Habitat Management Plan (approximately 6,560 acres). DFG-OSPR provided comments on the Draft Track 3 Impact Area MRA Munitions Response RI/FS in an October 24, 2006 memorandum to the Department of Toxic Substances Control (DTSC). The subject document provides responses to these comments in Appendix E. DFG-OSPR reviewed Appendix E to evaluate whether our previous concerns were addressed in the revised Draft Final document.

Comment 1. Response to Comment 1, page 62 of Appendix E. While the Response to the comment states that a process will be developed for adjusting remedial decisions as more data become available, DFG-OSPR continues to have concerns with relying on the existing limited site characterization data to develop remedial options for the entire MRA.

Response 1: Please see responses to DTSC General Comments 1 and 2.

Comment 2: Response to Comment 2, page 62 of Appendix E. DFG-OSPR reviewed the text that was added to Section 4.1 to provide a rationale as to why physical risks to wildlife were believed to be low. While anecdotal observations of no observed effect may be the only information that is available, they do not constitute the type of quantitative evaluation that would be required to establish that the physical risks to wildlife are low. As such, significant uncertainty remains regarding the actual physical hazards to wildlife posed

APPENDIX F

by the MEC at the site. The text in Section 4.1 should be revised to indicate that the level of physical risk to ecological receptors is unknown.

Response 2: Based on many years of site experience, the presence of MEC in the Impact Area MRA does not appear to be a concern in terms of physical risks to ecological receptors. Several iterations of biological resource evaluations and many years of monitoring show that the ecological environment in the Impact Area MRA is healthy and thriving. In fact, the USFWS has designated the entire Impact Area MRA as critical habitat necessary for the continued existence of Monterey spineflower, a federally threatened annual plant.

Comment 3: Response to Comment 3, page 62 and 63 of Appendix E. DFG-OSPR is aware that addressing physical risks associated with MEC will allow for characterization of chemical risks in the same area. As stated in Comment 1, DFG-OSPR continues to have concerns with relying on existing site characterization data to make remedial decisions for the entire MRA.

Response 3: Please see response to DTSC General Comment 1.

Comment 4: Response to Comment 4, page 63 of Appendix E. The response is acceptable.

Response 4: Comment noted.

Comment 5: Response to Comment 5, page 63 of Appendix E. The response is acknowledged.

Response 5: Comment noted.

CONCLUSIONS

DFG-OSPR requests that the document be revised based on the comments provided herein. The adequacy of site characterization remains a concern. DFG-OSPR supports the request by DTSC to provide additional information on the proposed approach for modifying remedial decisions as more data becomes available. If you have any questions or require further details, please contact Patty Velez by phone (831-649-2876) or by e-mail (pvelez@ospr.dfg.ca.gov).

**Comments from Mike Pool, California State Director, U.S. Department of the Interior,
Bureau of Land Management [February 22, 2007]**

COMMENTS

Comment 1: This letter is in response to the Draft Final Track 3 Impact Area Munitions Response Remedial Investigation/Feasibility Study Former Fort Ord, California (Track 3 RI/FS) that was released for review on January 26, 2007. The Bureau of Land Management (BLM) appreciates the efforts of the Army in cleaning up munitions and explosives of concern (MEC) at the former Fort Ord, and the partnership that our agencies have forged over the last 12 years in this regard. We look forward to the day when these lands can be cleaned up and transferred to support a successful reuse of the former military installation.

BLM's Policy Regarding Transfers of MEC Contaminated Lands

The BLM's policy for acquiring lands containing MEC is through Department of the Interior Manual, Part 602, Chapter 2 that states:

"It is the Departmental policy to minimize the potential liability of the Department and its bureaus by acquiring real property that is not contaminated unless directed by the Congress, court mandate, or as determined by the Secretary."

The Department allows bureaus to acquire property with liability only when Congress or the Court mandates the acquisition, or when the bureau determines that the acquisition benefits the bureau's programs and when the appropriate authority in the bureau or the Secretary of the Interior approves the acquisition. This latter situation generally is limited to properties for which substantial natural or cultural resource values override the associated environmental liability.

In the case of the former Fort Ord, the lands that are identified for transfer to the BLM contain numerous federally protected, state protected or rare plant and animal species. Therefore, our consideration of the remedial options must take into account what affects the program will have on the natural resource values of the former Fort Ord. This includes short-term direct affects from the cleanup program, and long-term affects due to limitations placed on management of these resources.

In the case of the Track 3 RI/FS, the document will need to further disclose the likely short-term and long-term consequences of implementing the various remedial alternatives to determine whether the cleanup options will lead to a MEC remediation that the BLM can support. This is consistent with the National Contingency Plan that explains that the RI/FS remedies must be evaluated in relation to how they are protective of human health and the environment. The BLM recognizes that additional clarification has been

APPENDIX F

added to the Track 3 RI/FS as a result of our October 13, 2006, comment letter. Specifically, disclosures under Sections 5.1.1 have been added that describe how human health and the environment is protected.

We are concerned, however, that reviewers comparing alternatives will be compelled to conclude that Alternative 3 is less protective of the environment than Alternative 4 because more sifting and temporary habitat destruction is assumed (i.e., 320 acres versus 85 acres). This should be clarified within the document because the habitat disturbance caused from sifting operations is not likely to be permanent. As stated in our previous comment letter, it is our experience based upon 10 years of habitat restoration activities at the former Fort Ord, that the maritime chaparral habitats are fairly resilient. Small to medium-sized areas that require full excavations for MEC clean up can usually be restored with some effort as long as the seedbed is protected. The seedbed can be protected by ensuring that the vegetation is removed through prescribed burning (as opposed to large scale cutting) and by using the sifted topsoil to reclaim the site. Some of these areas may require planting maritime chaparral seedlings to speed the recovery. Weed abatement of invasive species is very important following the disturbance to ensure that vegetation recovery is from target species.

Response 1: The Army appreciates BLM's perspective regarding the ability to successfully restore CMC; however, the Army must meet the HMP success criteria for habitat recovery. The HMP and biological opinions recommend that the Army limit the size of remediation areas to the smallest area possible to limit unnecessary disturbance of habitat. The Army is not aware of a mechanical method that can preserve the seedbed while still sifting out the contamination. Even if the Army attempts to set aside the topsoil for special handling, it is unknown whether the habitat restoration effort would be successful. Despite the attempts, the sifted topsoil would likely be mixed with the subsurface soil as a result of the large scale excavation and sifting operations. The Army does not believe there is a successful method to implement sifting and separation during MEC removal activities to preserve only the portions of the topsoil that contains the seedbed.

The text has been revised to provide additional discussion of the impacts on the natural resource values of the Impact Area MRA, including short-term direct effects from the cleanup program, and long-term effects due to limitations placed on management of these resources. The Army believes that restrictions proposed under Alternative 4 do not prevent the safe implementation of habitat management requirements identified in the HCP and therefore do not result in negative effects to the natural resource values. Please also see the Army's response to comment, below.

The Army acknowledges the DOI's cited current policy regarding land acquisition. We understand that eventual transfer of the impact Area MRA to BLM would be within the policy however; substantial natural resource values

APPENDIX F

exist in the Impact Area MRA, and the land reassignment does not increase the liability to the United States.

The Army has taken these substantial natural resource values into consideration during the development of remedial options at the former Fort Ord. This includes short-term direct affects from the cleanup program, and long-term affects due to limitations placed on management of these resources. The Army believes that the preferred alternative will result in remediation of the contamination sufficiently to protect human health and allow the continued management of the significant natural resources within the Habitat Reserve as described in the HMP and other documents, and is committed to working with BLM to allow for reuse of the property in acknowledgement of the BLM policy.

Comment 2: It appears that both Alternative 3 and Alternative 4 may require additional Consultations with the U.S. Fish and Wildlife Service (USFWS) because both alternatives exceed the temporary disturbance threshold of 75 acres under the USFWS Biological Opinions on the Habitat Management Plan. We do appreciate, however, your acreage estimations of sifting sites because it does help disclose some important short-term effects. The Track 3 RI/FS should, however, disclose cost estimates for habitat restoration (i.e., 320 acres versus 85 acres) of these sifting areas where habitat destruction is assumed. This is important to gauge the potential costs associated with the cleanup options.

Response 2: The cost estimates for habitat restoration after excavation/sifting are included in the FS cost estimates in Appendix A, Tables A-5 and A-6, for Alternatives 3 and 4, respectively. The costs of restoring habitat following excavation and sifting were annualized assuming \$45,000 per acre based on recent Fort Ord specific data, and are included in the task of Excavation / Sifting of \$115,000/acre as noted in Footnotes [c] and [d], for Alternatives 3 and 4, respectively.

It should be noted that the acreages attributed for sifting are estimates; the actual number of acres of habitat that would be temporarily disturbed by excavation and sifting could be more or less depending on site conditions. The Army expects that the estimated 85 acres of sifting under Alternative 4 would be conducted in several small areas over the entire period of the cleanup so that temporary habitat disturbance can be managed within the HMP allowance at any given time. On the other hand, the scale of possible sifting under Alternative 3 (estimated 320 acres) is expected to almost certainly exceed the HMP allowance for habitat disturbance thus requiring consultation with USFWS.

Comment 3: While we are confident that these sifting areas could be restored through active management and with some cost, the option of fencing off these individual areas is not an option that was considered. In our October 13, 2006, comment letter, we recommended that another alternative could be evaluated that would be a modification of Alternative 3 – we called this

APPENDIX F

Alternative 3b. This additional alternative would prescribe a removal to depth MEC remediation for the entire area, however, only a surface removal in areas designated as “special case areas.” “Special case areas” would need to be clearly defined, but would presumably mean areas that would: 1) expose cleanup workers to unacceptable risk from exposure when performing a subsurface remediation; or 2) require large-scale subsurface sifting operations over rare plant and animal habitats (i.e., a vernal pool) that could not be reasonably restored within a given timeframe - we recommend something longer than 5 years; or 3) be excessively expensive to cleanup subsurface areas on a per unit basis. Army munitions experts have apparently made an informed estimate of how many acres of sifting would be needed to clean the subsurface of the Track 3 Area; however, there is little information to know what type of habitats these may occur within. It would be important to know whether the sifting sites are within vernal pool areas, open grassland areas, or maritime chaparral.

Response 3: The Army does not believe that the suggested “Alternative 3b” would result in a significant difference in terms of protection of human health and the environment and compliance with ARARs—the primary evaluation criteria for the evaluation and comparison of remedial alternatives under EPA’s RI/FS Guidance. The implementation of the suggested alternative would result in the presence of multiple scattered areas where surface MEC removal would require the same land use controls as were described under Alternative 4. In addition, the suggested alternative leaves the areas of highest risk behind and the cleanup would take much longer to implement than Alternative 4. Based on the FS cost estimates in Appendix A, if the 320 acres were not sifted, the cost difference would be approximately \$37 million dollars less than excavation and sifting. This still leaves a cost difference of approximately \$250 million dollars between Alternative 4 and Alternative 3. For these reasons, the BLM’s suggested alternative was not further evaluated in the FS. The FS will be revised to provide additional information for clarification regarding the acreages of high-density areas that occur in each of these habitat types; Plate 5 of the report has been revised to show the high density areas overlain on the different habitat areas that are described in the Final RI/FS.

Comment 4: The time required to remediate Track 3 areas is disclosed as 8 years for alternatives 2 and 4, and 22 years for Alternative 3. This assumes that 800 acres can be cleaned up each year for alternatives 2 and 4, while 300 acres can be cleaned up each year for Alternative 3. While the longer cleanup timeframe for Alternative 3 is less desirable for expediency, it should be noted that it provides a better age-class distribution for the maritime chaparral. A healthy maritime chaparral ecosystem typically contains a variety of age-classes that support an abundance of species. Because the cleanup operations require removing almost all of the maritime chaparral that impedes MEC detection, each cleanup unit is relatively homogenous in regards to an age-class distribution following the response. As such, a longer

APPENDIX F

timeframe for MEC clean up is more desirable in widening the age-class distribution across the entire Track 3 area.

Response 4: A longer clean up timeframe would leave the danger of surface munitions in place longer, therefore is less desirable from human health perspective. Burning of up to 800 acres per year is consistent with the HMP and the Biological Opinions, therefore is protective of the chaparral plant community.

Comment 5: In our October 13, 2006, comment letter, we provided the Army a copy of our management program under the pending Habitat Conservation Plan (HCP). That management program has been folded into the revised HCP prepared by the Fort Ord Reuse Authority (FORA - January 2007). The 2007 HCP management program for the BLM lands in the Natural Resource Management Area is provided in Attachment A. Please refer to that management program as it is expected to supersede the management program within the 1997 HMP and 1995 Site Use Management Plan. It is important to refer to that management program because its lists 59 specific actions that the BLM is obligated to undertake as part of the base reuse program.

It is imperative for the MEC remediation to reasonably accommodate the commitments that BLM is being asked to undertake within the HCP. Should any of the 59 specific actions that the BLM is being asked to undertake within the HCP be unsafe (or cost prohibitive) to perform within the Track 3 Area due to MEC issues, then the BLM will not accept transfer of those lands for those HCP purposes. As the Army is well aware, lands contaminated with MEC limit some of the basic land management tools that ensure an efficient management program.

For this reason, we are concerned that areas that have undergone only a surface MEC remediation will be cost prohibitive to manage under the HCP. This is most evident in the program areas of prescribed burning, weed abatement, habitat restoration and public use management. For prescribed burning, hand crews and heavy equipment might not be able to scratch lines around spot fires – instead, more costly aerial equipment (i.e., helicopters) may need to be used. The Army's cost estimate of 2 million dollars to burn 800 acres is a clear example of how MEC issues can greatly increase prescribed burn costs. For weed abatement, spraying herbicide would be the only option as opposed to mechanical methods such as digging. Herbicide use is weather dependent and wind/rain can limit the control options by at least 50 percent. For habitat restoration, heavy equipment used for reshaping and ripping compacted sites would be greatly restricted. This would greatly increase restoration costs as would the restrictions that would be involved on planting seedlings in the ground. Finally, the cost of keeping trespassers and visitors out of MEC areas would be great. The BLM

APPENDIX F

disagrees that these costs would be a responsibility of our agency once the lands are transferred.

Response 5: The Army appreciates the clarifications that BLM has been providing regarding the types of habitat/land management activities that are planned to be conducted in the Impact Area MRA. The Army evaluated the 59 specific actions listed in the attachment to BLM comment letter. The Army believes that all of these actions can be implemented safely, and that implementations would not be cost prohibitive, with the following clarifications.

It should be noted that the HCP and the 59 specific management actions assume that there would be no land use controls. However, except for the no further action alternative, all of the remedial alternatives were developed to be comprehensive and to address long-term protectiveness, therefore land use controls were included as part of the alternatives. Elements of remedial land use controls include prohibition of unrestricted public access, maintenance of a perimeter fence, MEC recognition and safety training for reusers, and construction support for subsurface activities. In order to manage these requirements, the FS cost estimates included two full-time UXO-qualified personnel. In addition to specifically identified land use control elements such as construction support, these UXO-qualified personnel would advise BLM in reuse planning, activity planning, responding to reports of incidental suspect munitions, and other UXO safety-related matters. In the final RI/FS the Army has also included law enforcement support to supplement the access management-portion of the land use controls.

Regarding prescribed burning, the Army recognizes the need to address spot fires immediately. The possible presence of subsurface MEC could make the use of hand crews and heavy equipment unsafe in some areas, and the use of alternative methods to address spot fires could involve requirements for additional resources in those instances. Therefore, the FS cost estimates for Alternative 4 have been revised to include a helicopter onsite during prescribed burning of 100 acres per year by BLM within the Impact Area MRA. Please note that the Army's prescribed burn costs can not be directly compared to the costs of future BLM burns because to the Army's burns will be conducted in areas containing surface MEC and many more safety measures are implemented.

Although herbicide will likely be relied on for weed control to a greater degree than what is recommended in the draft HCP. As described in the Draft Final FS, (1) other methods of weed control will also be available with the support of onsite long term UXO-qualified personnel, and (2) a digital map of remaining anomalies will also be provided to BLM which will be useful in making land management decisions. In addition, partial subsurface removal and/or construction support that are included as part of Alternative 4 would sufficiently address or support habitat restoration activities, which BLM estimates to involve a total of approximately 100 acres per draft HCP.

APPENDIX F

Comment 6: One of the balancing criteria that the Army uses to evaluate the effectiveness of a remediation is the long-term effectiveness and permanence of the action. Soil movement is a common phenomenon in the maritime environment – with wind and rain causing erosion and deposition of sandy soil particles. This soil movement would likely cause some subsurface MEC to become exposed through time, and other MEC to become further buried through depositional processes. The document does not disclose how long Alternative 2 (Visual Surface MEC Remediation) and Alternative 4 (Combination of Visual Surface Removal and Removal to Depth MEC Remediation) would remain effective. It is reasonable to assume that after some period of time, additional surface MEC remediation would be required to maintain a surface MEC remediation.

Response 6: As described in the FS, which has been revised for further clarification, the UXO-Qualified Personnel onsite (identified as part of the remedy) would be available to periodically survey the surface removal areas to search for and remove any MEC that became exposed after the remedy was completed.

Comment 7: We look forward to reviewing the Final Track 3 RI/FS. Should you have any questions regarding our response, feel free to contact Rick Cooper, Hollister Field Manager, at or Eric Morgan, Fort Ord Manager.

Response 7: No response necessary.

APPENDIX F

ATTACHMENT A

Bureau of Land Management Habitat Management Responsibilities from the 2007 Draft Habitat Conservation Plan

3.5 BLM – Natural Resource Management Area

Approximately 14,638 acres of former Fort Ord lands are identified as the Natural Resource Management Area (NRMA), which comprises the largest habitat reserve on the former base, supporting a diversity of plant communities and wide range of habitat types important to the preservation of HCP species. This acreage includes existing roads, former ranges, former military training and administrative areas, and approximately 647 acres designated as an easement for the proposed Caltrans State Route 68 Corridor. The portion of this easement that could be developed includes a 300-foot-wide corridor through the NRMA. Any work proposed by Caltrans on this easement is not a covered activity and is not authorized as part of this HCP.

The BLM currently manages approximately 7,200 acres of this land (known as the Fort Ord Public Lands) which has already been transferred to BLM by the Army. Over the next decade or two, the Army plans to transfer the approximately 8,000 additional acres of the NRMA to the BLM. In the meantime, the Army must complete its pre-disposal actions associated with the cleanup of contaminated sites and munitions and explosives of concern (MEC) under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). Through the Army's cleanup process, vegetation must be cleared and MEC must be identified, located and removed from future habitat reserve lands. These pre-disposal munitions response (MR) actions cannot undermine the goals of species and habitat preservation described in the 1997 HMP. The remaining NRMA lands eventually transferred to BLM will likely have been subjected to prescribed burns and/or otherwise manipulated, but will remain undeveloped and suitable for long-term management as a habitat reserve.

In general, undeveloped areas in the NRMA will be maintained in their natural state. No more than two percent of the areas supporting native vegetation (about 300 acres) may be converted to areas with buildings or other development-oriented uses. The former Range Control compound (HMP Parcel F1.12) that currently serves as the BLM Project Office is already developed and is not included in this two percent development allowance in the NRMA. Any development that may occur in the Caltrans Transportation Easement that passes through the NRMA is also not included in this two percent development allowance. Only land management consistent with the conservation of biological resources will be conducted in the NRMA; a Natural Resources Management Plan will be developed and implemented for the area by BLM.

BLM's development on the former Fort Ord would be limited to buildings and/or facilities that would contribute the furtherance of goals and objectives outlined within this HCP, or would not substantially detract from the furtherance of those goals. These facilities may include visitor centers, visitor contact stations, roads, trails, public access locations, administrative support buildings or warehouses, and utility lines (i.e., water, electrical, telecommunications, etc). In addition to these facilities, the BLM is obligated under the Federal Land Policy and Management Act (43 U.S.C. 1761-1771) and Mineral Leasing Act (43 U.S.C. 185) to consider requests for

APPENDIX F

rights of way for a wide variety of public benefit facilities and infrastructures. These facilities may include proposals for new roads, development and expansion of communication sites, water storage tanks and well sites, etc. All development proposals would be evaluated in relationship to their direct, indirect and cumulative effects that they may have in relation to the furtherance of biological goals and objectives outlined within this HCP. All development projects will be sited to avoid or minimize impacts on HCP species. No development will occur within occupied Contra Costa goldfields habitat or known or potential breeding habitat for California tiger salamander.

Types of activities that will be allowed in the NRMA include: route, road and trail management and maintenance, habitat enhancement, fuelbreak construction and management, use of administrative areas, aquatic monitoring and educational programs, and species-specific monitoring and habitat enhancement. Recreational access will be allowed on established routes. No public motorized use on these routes will be allowed. During special events such as bike or equestrian races, motorized use of some trails may be allowed for equipment staging, safety purposes and/or emergency access. Vehicles may also be allowed on some trails for scientific research projects.

The BLM intends to develop, manage and maintain a system of roads and trails necessary for land management purposes and compatible public access within the NRMA. The exact location, number and configuration of the road and trails are difficult to delineate at this time. For purposes of this HCP, the BLM would manage and maintain about 100 to 110 miles of drivable road (administrative purposes), and an additional 50 to 75 miles of recreational trails. This would encumber about 330 to 355 acres of road/trail surface and sparsely vegetated road/trail shoulder. New route development (including administrative access roads, fuelbreak roads, recreation trails) would encumber less than 2 percent of the land base. The BLM would not count against the 2 percent development restriction any reroutes of trails or roads that involved closing and restoring certain route segments and opening alternative route segments to lessen overall impacts to sensitive resources in a given area. Development of routes within BLM's Fort Ord Project Office development parcel would also not be counted against the 2 percent development restriction on NRMA habitat parcels. The BLM intends to restore and stabilize up to 100 miles of former roads over the life of the HCP. This will result in the restoration of between 100 to 150 acres of degraded habitat. This road and trail retirement estimate includes restoration that has already been conducted by the BLM since land transfer of 7,200 acres in 1996.

3.5.1 Habitat Features and HCP Species

Five habitat types occur within the NRMA. The most abundant habitat type is maritime chaparral/coastal scrub. Other dominant types include annual grasslands, inland coast live oak woodland, coastal coast live oak. Habitats of special interest within the NRMA include riparian forests, perennial grasslands and vernal pools. Sand gilia, Monterey spineflower, California linderiella, seaside bird's beak, Toro Manzanita, sandmat manzanita, Monterey ceanothus, Eastwood's ericameria, coast wallflower, Hooker's manzanita, Contra Costa goldfields and California tiger salamander are known to occur in the NRMA. Potential habitat is available for California red-legged frog, black legless lizard, and Monterey ornate shrew.

3.5.2 Resource Conservation and Management Activities

APPENDIX F

BLM's management activities emphasize preserving, enhancing, maintaining and restoring (as appropriate) habitat quality of maritime chaparral and other habitat types within the NRMA and promoting the preservation of all HCP species therein. Some management activities are unique to certain habitat types or plant communities and others are procedures that apply throughout the NRMA. Some of the activities are focused on the protection, preservation or enhancement of HCP species and natural communities to meet the objectives of the conservation strategy of this HCP and others are simply required for basic property management. BLM's resource conservation and management activities will include, but not be limited to the following. Where specific actions are targeted to meet the objectives of the conservation strategy, those objectives are referenced. These actions are also cross-referenced in the discussion of biological goals and objectives in the conservation strategy (Section 5.5).

Establish Adjusted Baseline

The following specific actions are required to meet the landscape-level objectives of the conservation strategy of the HCP.

- *Specific Action BLM-1: Identify, characterize and map the aerial extent of natural communities within the NRMA no later than three years from transfer of the property from the Army or from issuance of the permits under this HCP, whichever is later.*

- *Specific Action BLM-2: Identify and map the extent and abundance of HCP plant species within the NRMA no later than five years from transfer of the property from the Army or from issuance of the permits under this HCP, whichever is later.*

- *Specific Action BLM-3: Identify, characterize and map the aerial extent of suitable habitat, and determine presence, absence and/or other characteristics of the HCP animal species within the NRMA following species-specific protocols for each (see animal monitoring section 6.3.2) no later than five years from transfer of the property from the Army or from issuance of the permits under this HCP, whichever is later.*

Prepare a Resource Management Plan

The following specific actions are required to meet the landscape-level objectives of the conservation strategy of the HCP.

- *Specific Action BLM-4: Describe and implement specific protocols for managing biological resources to meet the goals and objectives of the HCP. The plan will address management including restoration, enhancement and maintenance including an integrated program for control of non-native species; and include tools, programs and processes such as prescribed fire management.*

- *Specific Action BLM-5: Describe short-term and long-term development and land use plans, public access and recreational uses and other non-habitat-specific plans for the NRMA. Identify measures that can be implemented to avoid and minimize impacts to HCP species and natural communities with the potential to occur with siting, construction, occupation and/or maintenance of allowable facilities and uses.*

APPENDIX F

· *Specific Action BLM-6: Identify project level monitoring which is specific to the NRMA, and describe how base-wide monitoring program is implemented on the NRMA.*

· *Specific Action BLM-7: Submit draft resource management plan to FORA and CRMP no later than three years from transfer of the property from the Army or from the issuance of the permits under this HCP, whichever is later.*

Preserve, Enhance and Maintain Maritime Chaparral

BLM will maintain (at minimum) the viability and populations of species and their habitats covered within the HCP using (as one standard) those habitat areas documented during adjusted baseline surveys as described above. Over the 50-year life of this HCP, populations of individual HCP plant species are expected to fluctuate through normal succession such that early seral-stage species will become less evident as maritime chaparral stands age. Similarly, early seral-stage species will become more evident after older maritime chaparral stands burn. The HCP recognizes that protecting the seed banks within the soil of early seral-stage species is an important component of managing older stands of maritime chaparral.

BLM will use prescribed burning to provide a range of successional stages, prevent senescence, maintain native species diversity and, in particular, to maintain habitat for herbaceous HCP plant species. Alternative vegetation treatments will be tested to gain a better understanding of the effects of these various strategies. BLM will eradicate about 50 acres of noxious weed infestations in maritime chaparral each year in the NRMA and protect against noxious weed infestations on about 1,000 to 1,500 acres of new habitat opening each decade. Accelerated erosion caused by human use and intrusion will be reduced and disturbed areas, especially old roads and other areas associated with former military use, will be restored into healthy maritime chaparral where possible.

Maritime chaparral will be maintained as a patchwork of stands that support vegetation of various ages and structures. This habitat “mosaic” allows for high species and habitat diversity and provides sources of propagules for dispersal between patches. For purposes of this HCP, the long-term desired future condition of maritime chaparral habitat will contain a mixture of age classes and species that tend to carry lower fuel loadings at the habitat area/development parcel margins, and higher fuel loadings away from those margins. After 50 years, the desired future age-class distribution of maritime chaparral would have about 30% less than 20 years of age, 30% between 20 to 45 years of age, 30% between 45 to 70 years of age, and 10% greater than 70 years of age. These percentages may be adjusted based on the results of studies of maritime chaparral and recovery. Specific actions listed below meet resource level biological objectives 1.1, 1.2, 11.1, and 11.2 and 12.2 of the conservation strategy (see Section 5.0).

· *Specific Action BLM-8: Estimate and map maritime chaparral age class distribution in the NRMA within three years of HCP approval.* BLM will produce an acreage estimate and mapped distribution of current age classes of all maritime chaparral on NRMA lands that have been or will be transferred to BLM under the Habitat Conservation Plan.

· *Specific Action BLM-9: Continue to coordinate with the Army on vegetation removal strategies as part of the MEC cleanup program within the NRMA.* BLM will not perform prescribed burns for habitat enhancement purposes on sites that have surface MEC. BLM will, however, support

APPENDIX F

the consideration of prescribed fire on these sites by the Army as part of the MEC cleanup process under CERCLA (see also discussion under Changed Circumstances).

· *Specific Action BLM-10: Use prescribed burning on a rotational basis and wildfire suppression strategies, covering about 1,000 to 1,500 acres in the NRMA each decade, to replicate desired future conditions and fulfill vegetation and fuels management objectives.* The specific seasonal timing, patch size, decadal total, and rotational time of prescribed burns will be determined based on the results of studies of maritime chaparral and recovery. Assuming that there are about 9,000 acres of maritime chaparral within the NRMA, BLM will evaluate burn events (i.e., prescribed fires and wildfire) to determine whether the desired future age class distributions and species compositions are being attained. Should decadal burn targets/estimates be exceeded, BLM will adjust suppression and enforcement strategies to reduce the size and/or number of wildfires. Should decadal burn targets/estimates not be met, BLM will increase the number and/or size of prescribed fires.

· *Specific Action BLM-11: Use research-oriented vegetation treatments in lieu of in-season prescribed burning on up to 500 acres of maritime chaparral to regenerate decadent stands on a case-by-case basis.* BLM will use research oriented treatments such as cutting, mowing, goat grazing, out-of-season (i.e. before or after the optimum October/September window for) prescribed burning, and other measures to gain a better understanding of the effects of alternative vegetation management strategies, or for use in areas considered too hazardous to prescribe burn at certain times. Should certain methods produce favorable biological results, their application may be used more frequently when economical. However, if results indicate that certain treatments are not favorable to HCP Species, BLM will discontinue their use unless they are required to regenerate stands considered too hazardous to burn in season.

Restore Maritime Chaparral Habitat in Targeted Areas

Restoration activities are intended to recreate, upon a disturbed landscape, the abiotic and biotic characteristics and processes that produce equilibrium landforms bearing the highest quality habitat given the constraints of the region. The models for specific restoration sites are suitable reference sites selected from natural, functioning, undisturbed parts of the nearby landscape. The resulting restoration project should be indistinguishable from the surrounding terrain, given enough time to evolve toward the biotic and abiotic reference site. BLM will restore up to 15 acres of maritime chaparral annually for a total of 100 to 150 acres in the NRMA over the term of this HCP

Specific actions listed below meet resource level biological objectives 2.1, 2.2, 11.1, and 11.2 and 12.2 of the conservation strategy (see Section 5.0).

· *Specific Action BLM-12: Control erosion, remove hardstand, reshape, stabilize and restore existing degraded or destroyed sites associated with roads, gullies, or rills into naturally recurring maritime chaparral/coastal scrub habitat.* Site specific restoration and erosion control sites are difficult to delineate at this time. However, within the multiple range area where most of the maritime chaparral occurs, it is reasonable to expect that BLM will restore and stabilize up to 100 miles of former roads and/or associated gullies and unneeded hardstand areas over the life of the HCP. This estimate is based upon aerial surveys of the route network conducted within the *Road and Trail Resources Inventory (RATRI): Bureau of Land Management Lands, Former Fort*

APPENDIX F

Ord, Monterey County, California (2002) and consideration of the *Watershed Riparian Assessment Report* (2002). This estimate excludes the Army's restoration requirements associated with the munitions and explosives of concern (MEC) cleanup program, and includes restoration that has already been conducted by BLM since land transfer of 7,200 acres in 1996. If habitat disturbance results from public use, additional restoration beyond the estimated maximum of 15 acres per year would be required.

· *Specific Action BLM-13: Plant native plant seedlings, and/or broadcast native seed on restoration sites where appropriate to expedite the recovery of native vegetation.* Species selected for planting or broadcasting would mimic the closest adjoining habitat considered a reference site of healthy maritime chaparral. Native species plantings at the restoration sites would be limited to native seed or seedlings from Fort Ord genetic stock whenever possible. Non-local plant materials would be used only when important restoration projects needed to be completed and Fort Ord stock was not available. In the event that Fort Ord stock was not available, BLM would strive to use material from as close to Fort Ord as possible.

· *Specific Action BLM-14: Stockpile topsoil from areas potentially disturbed through restoration activities that are occupied with HCP plant species.* Soils will be stockpiled prior to the fall rains of any given growing season and redistributed in its former location prior to January 15 to provide sufficient time for germination, growth, and seed production.

· *Specific Action BLM-15: Flag areas adjacent to restoration sites that are occupied by HCP species and that will not be disturbed by heavy equipment.* Vehicle and foot traffic will be prohibited within the flagged area.

Preserve, Enhance and Maintain Oak Woodlands

BLM will maintain or improve the approximate extent, crown cover and quality of oak woodlands in the NRMA as documented in adjusted baseline surveys. Remnant oak woodlands will be managed to permit natural regeneration and to maximize the cover and dominance of native plant species, while controlling the spread and reducing current noxious weed infestations. Decadent stands will be regenerated through the use of vegetation treatments including mechanical thinning and understory clearing to fulfill vegetation and fuels management objectives as appropriate. Oak woodlands within the NRMA will be managed to promote the reestablishment of natural biotic systems, including interacting microbial, invertebrate, and vertebrate communities within oak woodlands. Appropriate oak species, canopy cover and associated understory species will be established in areas that had been degraded by historical uses. BLM estimates it will restore or improve up to ten acres of oak woodland habitat in the NRMA over the life of the HCP.

Specific actions listed below meet resource level biological objectives 5.1, 5.2, 5.3, 5.4, 11.1, 11.2, 15.1 and 16.1 of the conservation strategy described in Section 5.0.

· *Specific Action BLM-16: Monitor oak woodlands for indications of sudden oak death or other disease outbreaks and take appropriate actions if sudden oak death or other diseases are confirmed and if such actions are available and recommended through CRMP.* If sudden oak death or other potentially virulent diseases of oaks are identified during the plant monitoring program or in the course of normal management activities, BLM will evaluate the significance of

APPENDIX F

the occurrence and report its findings through CRMP. If control or remedial measures are available, BLM will take action as recommended through CRMP.

- *Specific Action BLM-17: Use prescribed burning in oak woodlands on a rotational basis as determined necessary and appropriate to fulfill vegetation and fuels management objectives.* The specific methods, seasonal timing, patch size, yearly total, and rotational time of prescribed burns would be determined based on experience with chaparral burns and the results of studies of oak woodlands and recovery undertaken by BLM.

- *Specific Action BLM-18: Use mechanical thinning and understory clearing in lieu of prescribed burning as determined necessary and appropriate to regenerate decadent oak woodland stands in areas considered too hazardous to burn.* The specific areas, methods, equipment used, timing and other aspects of woodland thinning and clearing programs would be based on case-by-case assessments, with emphasis on preserving and protecting habitat for Monterey ornate shrew and other woodland-dependant species. Thinning and clearing proposals would be reviewed through CRMP prior to implementation.

- *Specific Action BLM-19: Maintain the extent of potential habitat for Monterey ornate shrew and other woodland wildlife species.* BLM will preserve fallen trees, snags and duff and prohibit collection of wood in scruboak, oak woodlands, or riparian woodlands that are moist and contain thick duff and / or downed logs. This management activity will cease if, through monitoring, BLM determines that other HCP species are being adversely affected.

- *Specific Action BLM-20: Identify potential restoration sites, evaluate oak woodland regeneration within existing stands and plant native oak seedlings where appropriate to improve habitat quality.* While site-specific restoration/improvement sites are difficult to delineate at this time, it is reasonable to expect that the BLM will restore or improve up to ten acres of oak woodland habitat over the life of the HCP. This oak woodland habitat restoration/improvement estimate includes restoration that has already been conducted by the BLM since land transfer of 7,200 acres in 1996.

Preserve, Enhance and Maintain Grassland Plant Communities

Grassland plant communities in the NRMA will be managed to reduce fuel hazard, protect habitat for HCP species, and enhance native plant and animal habitat. Where possible, BLM will reestablish or introduce appropriate native species in areas that were degraded by historical uses or otherwise determined suitable for restoration. Specific actions listed below meet resource level biological objectives 6.1, 6.2, 6.3, 6.4, 11.1, 11.2, 13.2, 15.1 and 16.1 of the conservation strategy described in Section 5.0.

- *Specific Action BLM-21: Use livestock grazing (sheep) in NRMA grassland areas between January and August each year to reduce fuels, control non-native invasive grasses and reduce thatch buildup that can inhibit native forbs.* BLM will continue to lease about 2,500 acres in the grassland region of southeast Fort Ord for up to 2,700 sheep (ewes) plus their lambs to graze from January to May with extensions often granted into July or August, depending on remaining forage. BLM will initially limit the actual number of sheep permitted to graze on the southeast grasslands to no more than 1,000 ewes and their lambs unless and until BLM demonstrates that higher levels are needed for fuel reduction and control of non-native plant species and a strategy

APPENDIX F

is in place to minimize the impacts of livestock use on California tiger salamanders. BLM will consider extending the grazing program to other grassland areas within the NRMA if it could benefit vegetation management objectives in those areas.

· *Specific Action BLM-22: Monitor sheep grazing to determine its effectiveness in controlling the spread of various invasive, non-native species and its effects on grassland habitat for HCP species.* If monitoring indicates that grazing is ineffective in non-native species control, contributes to the spread of various invasive non-native species, or is detrimental to grassland habitat for HCP species, BLM will consider other methods of grassland management.

Alternatives to livestock grazing could include prescribed burning, mowing or other research-oriented alternatives following an integrated vegetation management approach as described above for maritime chaparral and below under non-native species control.

· *Specific Action BLM-23: Incorporate native grasses and forbs in the plant palette when restoring degraded areas in grassland habitat.*

· *Specific Action BLM- 24: Site allowable development in the NRMA to minimize impacts to remnant stands of native grassland.* Preserve, Enhance and Maintain Aquatic and Riparian/Wetland Habitats BLM will maintain or enhance the number and quality of aquatic habitat locations that support or could support HCP species such as Contra Costa goldfields, California tiger salamander, California red-legged frog and California linderiella. The aquatic wetland vegetation, wetland hydrology, and associated upland habitats will also be preserved and maintained. Non-native species that could threaten HCP species and/or degrade habitat quality, including nonnative pigs, bullfrogs, and fish will be reduced or eliminated. Specific actions listed below meet resource level biological objectives 7.1, 7.2, 7.3, 13.1, 13.3, 14.1 and 15 of the conservation strategy described in Section 5.0.

· *Specific Action BLM-25: Identify, map and/or characterize actual and potential threats to aquatic and riparian/wetland habitats within the NRMA through ongoing monitoring.* As part of the baseline studies and ongoing monitoring, conduct regular inventories within the watersheds of these habitat types to identify actual and potential physical, biological, water quality, recreation-related and other impacts and prioritize management and restoration activities accordingly. Physical impairments within watersheds including gullies, slides and other erosion, bank failures along streams, roads and hardstand areas in close proximity to aquatic or riparian/wetland habitats and culvert failures would be mapped. Biological threats including the presence of bullfrogs, non-native fish, non-native, invasive plants and feral animals would be identified and assessed (see also section on non-native species control). Authorized access near pools along designated trail systems by hikers, mountain bike riders, equestrians and pets; educational and research activities (i.e. school staff and students on field trips, researchers seining or netting ponds, etc.); illegal vehicle/motor cycle trespass, and other types of visitation and use in close proximity to (or in) aquatic habitats would be evaluated. Finally, other habitat management actions (e.g. prescribed burning, weed eradication, livestock grazing) in watersheds would be monitored to identify any deleterious effects they might have on aquatic or riparian/wetland habitat for HCP species (see also discussion below).

· *Specific Action BLM-26: Periodically monitor water quality in seasonal pools and perennial ponds.* Collect water (standard grab) samples in seasonal pools and ponds in concert with the

APPENDIX F

baseline studies and ongoing monitoring and analyze for basic water quality parameters (e.g. turbidity, pH, nitrates, disease organisms, etc.). If results indicate levels above accepted standards or significant increases over baseline conditions, make every reasonable effort to identify the source problem and initiate remedial action in accordance with watershed protection measure described herein or other adaptive management strategies (see Adaptive Management section).

· *Specific Action BLM-27: Limit water use by livestock to no more than three ponds annually in the NRMA.* BLM will develop and implement a monitoring and adaptive management strategy to address the potential impacts on California tiger salamanders of water use by livestock in the southeast grasslands and adjust sheep grazing numbers and water use limits accordingly (see Adaptive Management Section 5.5).

· *Specific Action BLM-28: Prohibit livestock access to vernal pools and other aquatic areas outside of the southwestern grasslands in the NRMA.*

· *Specific Action BLM-29: Modify or adapt the prescribed burn program and other (e.g. research-oriented) vegetation management treatments within certain areas if monitoring indicates harmful effects on the watershed or aquatic habitat for HCP species.* Habitat and vegetation management treatments described elsewhere in this chapter will be modified in areas where monitoring clearly demonstrates deleterious effects on the watershed, aquatic environments or riparian/wetland habitats (see also Adaptive Management Section 5.5).

· *Specific Action BLM-30: Modify or adapt livestock grazing practices if monitoring indicates harmful effects on the watershed or aquatic habitat for HCP species.* If monitoring indicates that grazing is detrimental to the watershed or aquatic habitat for HCP species, BLM will consider changing grazing practices or other methods of grassland management. Alternatives to livestock grazing could include prescribed burning, mowing or other research-oriented alternatives following an integrated vegetation management approach.

· *Specific Action BLM-31: Restrict pets from aquatic and riparian wetland areas.* Dogs and other domestic pets will not be allowed in ponds, pools, streams, wetlands or riparian areas. All pets must be on leashes whenever they are in close proximity to such areas.

· *Specific Action BLM-32: Relocate roads and trails away from aquatic and riparian/wetland habitats when feasible, and remove unneeded hardstand areas consistent with priorities established through watershed inventories.* Road and trail removal and relocation, hardstand removal and site restoration would be completed as described elsewhere in this chapter. While specific restoration sites are difficult to delineate at this time, it is reasonable to expect that the BLM will restore up to five acres of aquatic and riparian/wetland habitat over the life of the HCP. This aquatic and riparian/wetland habitat restoration/improvement estimate includes restoration that has already been conducted by the BLM since land transfer of 7,200 acres in 1996.

· *Specific Action BLM-33: Remove introduced wildlife species as warranted, especially predators, feral animals, and pests from aquatic and riparian/wetland habitats and their watersheds.* Identify and implement specific programs to remove and/or control non-native

APPENDIX F

wildlife, especially predators that threaten known populations of aquatic HCP species. BLM has already identified a program to remove bullfrogs from ponds where they are known to occur by gigging, seining or dip-netting and a program to electroshock ponds to remove non-native fish in certain ponds where they have been documented (see also 3-31 discussion below). However, BLM may also consider stocking some ponds and managing them for recreational fishing. Other specific programs will be developed as a result of the watershed inventories conducted in the NRMA.

Control Activities in Watersheds of Aquatic and Riparian/Wetland Habitats

The following actions are intended to reduce potential threats to aquatic habitats from anthropogenic factors. Specific actions listed below meet resource level biological objectives 8.1, 8.2, 8.3, 11.3, and 13.2, of the conservation strategy described in Section 5.0 ·

Specific Action BLM-34: Identify priority sites and implement appropriate erosion control and site restoration methods. Prioritize candidate erosion control and restoration sites based on the watershed inventories described above and use methods to control erosion and restore sites as described below.

· *Specific Action BLM-35: Restrict public and educational visitation to locations that could degrade the quality or quantity of aquatic and riparian/wetland habitat.* Public use will be redirected away from aquatic and riparian/wetland areas if monitoring indicates harmful effects on the watershed or aquatic habitat for HCP species.

· *Specific Action BLM-36: Conduct periodic patrols by law enforcement officers and other visitor support staff to reduce or eliminate illegal vehicle use into aquatic and riparian/wetland habitats.* Ongoing patrols and enforcement within the NRMA and at key access locations into the NRMA will make all reasonable efforts to stop illegal trespass into these habitats (see also discussion below).

· *Specific Action BLM-37: Monitor vehicle routes within 175 meters of any known breeding pond for CTS on mornings after nights with rainfall to attempt to detect mortality caused by motor vehicles.* If more than two CTS are observed crushed in any one year, then BLM will consider protective measures such as posting caution signs where routes cross within 175 meters of known breeding ponds and restricting driving privileges along these routes during periods when CTS are active.

· *Specific Action BLM-38: Establish safe movement routes for CTS where roads or other structures must traverse a known or possible movement route.* Site and design needed roads or structures so that they do not create a barrier between known or potential breeding ponds for California tiger salamander and suitable upland habitat.

· *Specific Action BLM-39: Maintain characteristics of confirmed occupied upland habitat for CTS in the NRMA as documented during baseline studies and ongoing monitoring.* Upland habitat within 1 km of known CTS breeding ponds will be evaluated during baseline studies and ongoing monitoring to determine suitability for CTS. Habitat management activities will focus on maintaining and/or improving upland habitat for CTS in these areas.

APPENDIX F

Control of Non-Native Species, Pests and Diseases

BLM will control the spread and reduce the abundance and distribution of noxious weed infestations using integrated vegetation management methods, with a goal of limiting the overall area of individual infestations to no more than five percent of the total area of habitat. A combination of standard methods and research-oriented treatments will be employed, including manual removal, mowing, use of gas powered weed cutters, propane torches, hand spraying of herbicide or vinegar, livestock grazing and prescribed burning (both in and out of season) to contain, reduce or remove infestations of non-native plant species. Protocols for implementing an integrated vegetation management program that minimize effects on HCP Species are presented in Appendix F. Specific actions listed below meet resource level biological objectives 9.1, 9.2, 9.3, 9.4, 15.2, 11.3, 16.2 of the conservation strategy described in Section 5.0.

· *Specific Action BLM-40: Identify and map the species or categories of weed infestation targeted for removal.* BLM has identified 50 non-native plant species for abatement as of 2005 and has aerial photography showing known locations of each. However, weed inventory and mapping (aerial surveys) will be an ongoing process occurring in concert with the baseline surveys and plant monitoring program to determine whether abatement actions were contributing to the fulfillment of noxious weed control goals. (see Monitoring section). While the majority of target species will be included in the inventories, some target weed species occur sporadically over much of the NRMA and it is not feasible to map all their occurrences. Aggressive exotic (and usually perennial) plants such as Pampas grass, French broom or iceplant, and large, dense infestations of European and other non-native annual plants will continue to be mapped. However, smaller or individual occurrences of weeds such as various thistles, poison hemlock and cut-leaved fireweed do not warrant mapping unless large infestations are observed.

· *Specific Action BLM-41: Develop strategies for eradication of noxious weed species, categories of weed infestation and/or infestations within certain habitat types.* Identify appropriate abatement techniques, following the integrated vegetation management approach, for target weed species or categories of infestation with consideration for the habitat type, location relative to sensitive resources, proximity to development and other factors. Methods could include a combination of prescribed burning, manual removal, mowing, use of gas powered weed cutters, propane torches, and hand spraying of herbicide or vinegar. Noxious weed abatement would focus on containing, reducing or eradicating existing infestations from spreading, and preventing the establishment of new infestations. Within the NMRA where most of the maritime chaparral is located, infestations are typically found in openings created by past disturbances. New habitat openings are expected to occur from fuel break development and maintenance, prescribed burning and wildfire, and research-oriented vegetation treatments.

· *Specific Action BLM-42: Refine the integrated vegetation management program through monitoring and adaptive management in an effort to reduce dependence on herbicides.* BLM will continually refine the integrated vegetation management program through monitoring and adaptive management in an effort to reduce dependence on herbicides. The goal of the program is to eliminate or substantially reduce the size of existing populations of invasive non-native plants and reduce activities that introduce and/or contribute to the spread of those species so that future eradication efforts can also be reduced. Herbicides will only be applied when there is no risk of take of listed species. The timing, location and method of herbicide application will be adjusted in conformance with BLM protocols (see Appendix F). Water quality testing, drift cards

APPENDIX F

or other controls may be used to further assure that there are no deleterious effects on listed species. A pesticide use plan that includes the typical methods for pesticide applications within the NRMA will be included in the resource management plan.

· *Specific Action BLM-43: Address actual and potential adverse effects from introduced wildlife species, feral animals and pests on HCP species and their habitats.* Identify and evaluate issues with feral animals and pests through the baseline studies and outline steps for addressing those issues in the Resource Management Plan. Actions identified should not result in take of or adverse effects on HCP species and should be reviewed by the USFWS and CDFG through CRMP prior to implementation. Monitor the effectiveness and habitat effects of the actions and use adaptive management strategies as appropriate to refine the control program.

· *Specific Action BLM-44: Remain informed about plant and animal diseases that have or may spread into the Monterey area and that could affect HCP species and their habitats.* Review and discuss through CRMP and identify actions to address diseases that are considered potential problems. Provide that information to the USFWS and CDFG for review prior to implementation. Actions should be designed to avoid take of and/or adverse affects on HCP species. Monitor actions employed to minimize the spread of diseases and apply adaptive management strategies as appropriate.

Control and Reduce Erosion and Restore Disturbed Sites

While wind, sheet, rill and gully erosion are natural processes in the maritime chaparral landscape; accelerated erosion is normally associated with road construction and maintenance (or lack of maintenance) and former military training. Control will focus on reducing the source of erosion such as concentrated runoff, point discharges, gullies and other drainage problems, especially associated with impervious surfaces, disturbed landforms, roads and trails.

Restoration of eroded or otherwise disturbed areas should recreate characteristics similar to natural, functioning, undisturbed parts of the nearby landscape. Specific actions below meet resource level biological objectives 10.1, 10.2, 11.3, 15.2, and 16.2 of the conservation strategy described in Section 5.0

· *Specific Action BLM-45: Identify high priority sites where erosion control and site restoration measures are warranted.* As part of the baseline studies and ongoing monitoring, conduct regular inventories of the NRMA to identify and prioritize erosion control, hardstand removal and restoration sites. Sites could include heavily used unsurfaced roads and trails, former military roads (paved and unpaved), gullies and hardstand or other disturbed areas, especially those adjacent to populations of HCP species or to riparian or wetland habitats (see also discussion on aquatic and riparian habitats above). BLM initially estimates that over 100 miles of former roads and/or associated gullies and unneeded hardstand areas will be restored and stabilized in maritime chaparral habitat over the life of the HCP (see also Specific Action 12 above).

· *Specific Action BLM-46: Identify and implement appropriate erosion control and site restoration methods for priority areas.* Methods could involve soil and vegetation removal adjacent to degraded areas; the use of fill soils; removal of “chip seal,” asphalt, concrete or other hardstand surfaces; ripping of compacted roadbeds and other surfaces; re-contouring of eroded areas; installation of drainage features such as outlet ditches, rolling dips (similar to waterbars),

APPENDIX F

and berms (as needed to facilitate the proper drainage of storm runoff); application of certified weed-free rice or barley straw or other similar functioning product (e.g. chipped vegetation) to cover and protect the soil surface; application of noninvasive, non-persistent annual grasses (such as barley) or other species; and the addition of soil amendments such as fertilizers and gypsum. Earthwork would primarily be accomplished using heavy equipment and occasionally hand crews. Site plans would be drawn up for each project site including methods, necessary equipment, supplies, materials, and labor. Surface protection would be maintained to the extent feasible given the need and funds available, until native species were effectively protecting the surface of a given site from significant erosion.

· *Specific Action BLM-47: Seed or plant re-contoured and restored areas with native plant species from Fort Ord genetic stock whenever possible given the need and funds available.* Non-local plant materials would be used only when important restoration projects needed to be completed and Fort Ord stock was not available. In the event that Fort Ord stock was not available, BLM would strive to use material from as close to Fort Ord as possible. Species selected for planting or broadcasting would mimic the closest adjoining native habitat.

Maintain Fuelbreaks

The purpose of this management activity is to maintain fire and emergency access and fuel reduction standards around and through the NRMA to provide for adequate management during prescribed burns and to reduce fire threats to communities at risk. The primary responsibility for providing adequate fuelbreaks or other appropriate separation between the reserve and developed private lands or lands designated for future development rests with the development lands (see Borderlands section). However, fuel reduction measures within the NRMA could be used to complement the required fuelbreak measures on borderland parcels adjacent to the NRMA.

· *Specific Action BLM-48: Maintain and manage about 100 to 110 miles of fuelbreaks of variable width depending upon fuel type, fuel loading (tons per acre), topographic position and features of the area.* Fuelbreaks, in many cases along drivable roads, with widths typically ranging between eight to 23 feet beyond one or both of the road shoulders and up to 45 feet beyond the shoulder in areas where sharp turns occur in oak woodlands, would be maintained using hand crews and mechanized equipment. Maintenance could occur annually or as infrequently as every two to four years, depending on vegetation type, rainfall amounts and specific locations. Vegetation would be removed using hand tools, chain saws, an All Seasons Vehicle (ASV), a tractor-operated mower, or a combination of the above. Manually-operated hand tools would be used to limb up oak trees so that no oak tree branches in the fuel break would be lower than nine feet off the ground. Understory vegetation would be cleared using the ASV or mower except in areas where hand crews and chippers must be used instead. In general, shrubs would be cleared to a height of two to six inches, leaving a mostly herbaceous cover on the ground. In oak woodlands and savannahs, branches below nine feet would be trimmed and the canopy thinned. Other surface fuels would be removed, leaving an open park-like landscape. Mechanized equipment would be used to chip or grind up the cut vegetation or it would be piled and burned at a later date. Cut vegetation may be loaded into a truck to be chipped off-site and used for erosion control in other locations, or chipped and dispersed back into the project area. Pile burning would be completed outside of the declared fire season. In locations where burning may encourage the propagation of listed plant species, fuels could be windrowed for later burning.

APPENDIX F

This technique would be continued or discontinued depending on post-burn monitoring results to protect listed species.

· *Specific Action BLM-49: Implement special fuels management strategies if determined necessary to reduce the risk of wildfire adjacent to Borderlands.* Every two years, BLM will assess fuel loads in areas within the NRMA that are adjacent to currently developed private lands or lands designated for future development to determine fire threats to communities at risk. These areas will be designated Wildland Urban Interface Areas and special fuels management strategies, including mechanical clearing, goat grazing, prescribed burning and other strategies will be considered if the biennial assessment determines that the chance of a wildfire moving towards or from these communities must be reduced. BLM has developed protocols for fuels management strategies that minimize effects on HCP species (see Appendix F). BLM will also periodically patrol these areas to educate landowners and visitors about wildfire risks.

Maintain and Improve Roads and Trails

The purpose of this activity is to maintain and improve roads and trails within the NRMA that are necessary for land management purposes and to provide opportunities for compatible public access on a system of well-defined and maintained trails. Existing road and trail systems that are redundant or unneeded will be eliminated or restored and needed transportation systems will be rerouted away from occupied habitat of HCP species where possible – especially State and Federally listed species. Restoration of unneeded roads meets objectives 10.2 and 11.3 of the conservation strategy described in Section 5.0.

· *Specific Action BLM-50: Maintain paved roads to include asphalt (or equivalent) surfaces 20 to 25 feet wide with shoulders typically three to four feet wide.* Road shoulders would be mowed annually and graded as needed to control erosion, maintain slopes and contours and ensure proper drainage. Repaving would occur as needed, but the asphalt surfaces of existing roads would not be widened. Glyphosate-based (e.g. Roundup Pro®) or other appropriate herbicides as approved by BLM in coordination with CRMP would be used to control vegetation within asphalt cracks inside roadbeds, along a 6-12 inch strip along asphalt road edges, within 6-12 inches around and inside concrete culverts inlets and within 6-12 inches along roadside concrete or otherwise hardened drainage ditches.

· *Specific Action BLM-51: Maintain unpaved roads to include a compacted soil surface travel lane eight to ten feet wide with a six to eight foot sparsely vegetated shoulder on each side.* Together the road shoulders and travel lane would be 20 to 26 feet wide. Road shoulders would be mowed annually with a rubber-wheeled tractor mower. The travel lane and portions or all of the road shoulder would be graded by heavy equipment every three to five years to maintain the road and ensure proper drainage.

· *Specific Action BLM-52: Maintain trails to include a compacted soil surface that is four feet wide.* Trail maintenance would include vegetation trimming on an as needed basis and repairs to the trail surface using either hand tools or mechanized trail equipment. Mechanized trail equipment would use a four to six foot wide blade to grade a given trail, but only four feet would be maintained for actual recreational use. Any scraped surfaces outside of the four foot trail would be seeded, strawed, and allowed to revegetate. BLM anticipates that any given trail

APPENDIX F

segment would be graded once a decade or less. Trails used one or more times annually for large mountain bike and other events would require more frequent repairs and grading.

· *Specific Action BLM-53: Close and rehabilitate (retire) redundant or unneeded road and trail systems within the NRMA.* While site-specific road and trail retirement sites are difficult to delineate at this time, it is reasonable to expect that the BLM will restore and stabilize up to 100 miles of former roads over the life of the HCP. This will result in the restoration of between 100 to 150 acres of degraded habitat. This estimate is based upon aerial surveys of the route network conducted within the *Road and Trail Resources Inventory (RATRI): Bureau of Land Management Lands, Former Fort Ord, Monterey County, California* (2002). This road and trail retirement estimate includes restoration that has already been conducted by the BLM since land transfer of 7,200 acres in 1996.

· *Specific Action BLM-54: Develop new routes when needed outside occupied habitat of federally listed species to the maximum extent possible.* New route development (including administrative access roads, fuelbreak roads, recreation trails) would encumber less than two percent of the land base. The BLM would not count against the two percent development restriction any reroutes of trails or roads that involved closing certain route segments and opening alternative route segments to lessen overall impacts to sensitive resources in a given area. Development of routes within BLM's Fort Ord Project Office development parcel would also not be counted against the two percent development restriction on NRMA habitat parcels.

Control and Manage Access

This management activity is directed at providing public access in habitat reserve areas to promote the enjoyment, appreciation and conservation of the species and habitats at Fort Ord while maintaining ecological functions and values. Access or certain types of access will be limited, restricted and/or prohibited in areas where habitat values or public safety could be compromised. BLM will assist adjacent Borderlands managers in their identification and siting of appropriate access control measures.

· *Specific Action BLM-55: Identify levels and locations of public and other access.* As part of the baseline studies, identify and map the principal access points into and destinations within the NRMA, the existing road and trail network, existing barriers such as fences, steep topography and other features that preclude or impede access, and locations or areas that are sensitive, dangerous or otherwise inadvisable for unauthorized public or other access. Describe and assess the current and anticipated levels and types of uses associated with these locations in the resource management plan. Update this access inventory and assessment at least every two years in concert with the assessment of *Wildland Urban Interface Areas* described above (see Specific Action NRMA-11 above).

· *Specific Action BLM-56: Limit motorized vehicles within the NRMA to roads that are managed for public access except for emergency use and required management and maintenance.* BLM will identify restricted access locations associated with the internal road network in the NRMA and secure against unauthorized entry by motorized vehicles with either a gate or a vehicle barrier. Measures such as fences, barriers, signage, and other means to prohibit unauthorized motor vehicle access from Borderlands parcels into the NRMA, and gates to provide emergency vehicle access if fences are used, are the responsibilities of the adjacent borderland manager and

APPENDIX F

not BLM (see Borderlands discussion). BLM, the Borderland parcel manager, and other appropriate agencies shall be provided keys to the gates.

· *Specific Action BLM-57: Use "Trail Closed" signs, brush piles, fencing or other measures to identify trails, fire roads or other access points that are officially closed to public.* Measures such as fences, barriers, signage, and other means to prohibit unauthorized pedestrian, bicycle, pet and other access from Borderlands parcels into the NRMA are the responsibility of the adjacent Borderland manager and not BLM (see Borderlands section in previous chapter).

· *Specific Action BLM-58: Maintain regular security patrols to help control pedestrian, pet, bicycle, and motorized vehicle trespass.* The adjacent borderland manager is the primary party responsible for controlling pedestrian, pet, bicycle and motorized vehicle trespass into the NRMA from adjacent Borderlands parcels.

· *Specific Action BLM-59: Install and maintain interpretive signs/displays that illustrate the importance of the NRMA and methods for maintaining its habitat values.* Interpretive signs installed by the Army will be maintained and updated/replaced as needed. New interpretive signs, displays, trailhead markers and other signs advising on activities such as trash removal, limiting ground disturbance, restraining pets, discouraging capture or harassment of wildlife, and prohibiting the collection of HCP plant species will be installed.

Comments from Diane K. Noda, Field Supervisor, United States Department of the Interior, Fish & Wildlife Service [March 9, 2007]

INTRODUCTION

We have reviewed the Draft Final Track 3 Impact Area Munitions Response Area Remedial Investigation / Feasibility Study for Former Fort Ord, California (Draft Final RI/FS); dated January 26, 2007. This document includes the Department of the Army's (Army's) revisions and responses to comments that we and other entities made on the Draft Track 3 RI/FS in Fall 2006. The Draft Final RI/FS is responsive to some of our comments; having reviewed it and discussed it with your staff we have a better understanding of the alternatives and your decision making process. We appreciate that the Army has a complex and difficult task in selecting an alternative that is protective of human health and the environment and also cost efficient.

The CERCLA RI/FS process is intended to provide a formal method to develop, evaluate, compare, and select a preferred remedial approach that will protect human health and the environment. A rigorous evaluation depends upon full and accurate identification and consideration of all of the effects on human health or the environment that each analyzed alternative presents. One of our primary concerns remains that the Track 3 feasibility study does not fully identify and discuss the environmental costs and benefits of each of the alternatives.

For example, it is still not clearly explained how the preferred alternative, versus the other alternatives, would influence the future condition and habitat management of the 6,560-acre impact area. The area addressed in the Draft Final RI/FS is a substantial and ecologically valuable part of the future habitat reserve system identified for Fort Ord. The preservation, restoration, and management of lands within the habitat reserve system is intended to mitigate the losses to federally and state listed species that will occur on former Fort Ord lands that are designated for development. The intended benefits to listed species depend not just on preserving the land, but on carrying out a set of restoration and land management actions.

As you know, we are currently reviewing the draft habitat conservation plan for former Fort Ord (HCP). This HCP would support the Service's issuance of a permit to allow incidental take of federally listed species on those lands designated for development. To meet our issuance criteria, the HCP must provide assurances that the conservation actions described in the HCP will be both funded and implemented. Therefore, we need to understand how the Army's preferred alternative in the Track 3 RI/FS may affect the implementation of the HCP-required habitat management activities and whether or not it will make them logistically or cost prohibitive from the viewpoint of a future land manager. We have the following comments on the Draft Final RI/FS, which are similar to comments 2, 3, and 4 in our November 1, 2006, comment letter on the Draft RI/FS, as those comments do not appear to have been fully addressed.

APPENDIX F

COMMENTS:

Comment 1: Given the influence your preferred alternative may have on the way in which the 6,560-acre Track 3 Impact Area is managed in the future, we believe the alternatives analysis or a supplementary analysis should fully disclose (a) how the costs of future land management under the alternatives would differ due to the level of remediation; (b) which of those costs the Army would be responsible for, as opposed to the future land recipient, (c) barriers to conducting habitat management activities, such as substantially increased costs or narrower implementation periods for prescribed burning, (d) concomitant environmental effects of conducting habitat management activities under Alternatives 3 or 4 (e.g., larger fuel breaks, increased use of fire retardants, increased reliance on herbicides rather than manual weed control). We value the Army's long experience at Fort Ord conducting habitat management activities on lands containing munitions and explosives of concern (MEC). By sharing your expertise in clearly reasoned analysis, you will assist us in moving forward with other agreements that rely on assurances of future habitat management (e.g., the HCP and issuance of incidental take permits).

Response 1: The Army acknowledges the USFWS's comment regarding the components of the Army's preferred alternative that would have an affect on the future management of the Impact Area MRA by BLM. Please see the army's Responses to BLM Comments above regarding how the costs of future land management under the alternatives would differ due to the level of remediation. The Final FS will be revised to clarify how each of the components noted in the comment will be addressed during implementation of the preferred alternative.

Regarding Comments 1 (a) through (e), the Army would be responsible for all costs identified in the FS as components of the remedial alternatives identified in Section 4 of the FS, and that are described in detail in the cost estimates presented in Appendix A of the FS. Costs for future land management under the alternatives would not differ significantly due to the level of remediation.

All of the alternatives were developed to be comprehensive, to address long-term protectiveness and to support the reuse of the area as a habitat reserve. The remedial alternatives include land use controls so that BLM's implementation of land management actions would not be burdened by the results of the clean-up. Remedial land use controls included in the alternatives include maintaining the perimeter fence and signs and law enforcement support; two full-time UXO-qualified personnel who would provide MEC recognition and safety training and construction monitoring, and would advise BLM in reuse planning, activity planning, responding to reports of incidental suspect munitions, and other UXO safety-related matters. In addition, Alternative 4 also includes helicopter support for select future BLM habitat management burns where warranted.

APPENDIX F

The Army believes that, by incorporating the remedial land use controls noted above, all future habitat management activities can be implemented safely, the implementations would not be cost prohibitive, and there are no barriers to conducting habitat management activities. Fuel breaks and use of fire retardants for BLM's future habitat management burns are not anticipated to be significantly different due to different "level" of remediation. The level of remediation would not change the burn window for the future BLM burns. Under Alternative 4, helicopter support would be available for select future BLM habitat management burns where warranted.

Although herbicide will likely be relied on for weed control to a greater degree than what is recommended in the draft HCP, as described in the FS other methods of weed control will also be available with the support of onsite UXO-qualified personnel. A digital map of remaining anomalies would be provided to BLM, which will be useful in making land management decisions. In addition, construction support that is included as part of all three alternatives would sufficiently address or support habitat restoration activities. By incorporating UXO safety support that would be provided as part of the remedy, BLM's implementation of land management actions would not be burdened by the results of the clean-up.

Comment 2: The response in the Draft Final RI/FS to our previous questions about costs for future habitat management under alternative 4 indicates (Appendix E of the subject document, page 57, Response 4) that a provision for long-term safety support personnel would be part of the remedy. Based on a telephone conversation between members of our staffs last month, we understand this includes 2 full-time safety support personnel and that the Army would be responsible for providing/funding these support personnel (since they are part of the remedy) for the future land manager for as long as they were needed (presumably, for as long as the subsurface MEC remained and earth disturbing activities, such as wildfire suppression or erosion control, could occur). If our understanding is correct, please clarify this in the document. We also request you provide the basis for determining that 2 full-time staff would adequately cover the increased planning, training, and construction/safety support associated with habitat management under Alternative 4.

Response 2: As noted in the comment the Draft Final FS included as a component of the preferred alternative (and as noted in the comment regarding the telephone conversation) that two full-time onsite UXO-qualified personnel would be available to provide long-term support during reuse of the property, and that the Army would be responsible for providing/funding these support personnel (since they are part of the remedy) for the future land manager for as long as they are needed (presumably, for as long as the subsurface MEC remained and earth disturbing activities, such as wildfire suppression or erosion control, could occur). Under CERCLA, the Army is the lead agency responsible for the implementation and maintenance of any selected remedy at the former Fort Ord. Although the

APPENDIX F

Army may transfer some of the remedy implementation responsibilities to another party, the Army will retain ultimate responsibility for remedy integrity. The Final FS will be revised to further clarify this component of the alternatives, and to provide additional detail on the basis for determining the level of effort of the personnel as adequate for proposed reuses.

Comment 3: Please indicate which Land Use Controls under Alternatives 3 and 4 would be the responsibility of the future land managing agency (Bureau of Land Management), following land transfer, and which would continue to be the responsibility of the Army. For instance, the response to the Department of Toxic Substance Control's Comment 12 (Appendix E, page 35) indicates that, following land transfer, the future land manager will be preparing a site security plan on which the agencies will have the opportunity to comment. The response further indicates that site security will be modified, as necessary, based on changes in the nearby human populations. Our interpretation of this is that the future land manager will be responsible for the costs and implementation of site security following land transfer and that site security requirements are likely to increase as the surrounding human population grows. Clarifying future responsibilities associated with acceptance of these lands will help us evaluate the potential for a land manager to be able to implement the activities identified in the HCP.

Response 3 The Final FS will be revised to further clarify which component of the alternatives would be the responsibility of the Army and BLM, and to provide additional detail on the basis for determining the level of efforts and costs. Under CERCLA, the Army is the lead agency responsible for the implementation and maintenance of any selected remedy at the former Fort Ord. Although the Army may transfer some of the remedy implementation responsibilities to another party, the Army will retain ultimate responsibility for remedy integrity.

Comment 4: We appreciate the clarification the Draft Final RI/FS provides in terms of the estimated acreage under Alternatives 3 and 4 that may contain significant amounts of metallic debris and, therefore, may require large scale excavation. Please provide further detail on the locations of these potential excavation areas, if possible (e.g., whether they occur under one or more wetlands or in upland maritime chaparral). With this information, we will be better able to assess the Army's conclusion that Alternative 3 would not be protective of the environment due to the level of excavation anticipated.

Response 4: Plate 5 of the Final RI/FS has been revised to show the requested information, and the text will be revised as appropriate to reference this information.

APPENDIX F

Additional Comments:

Another area which we believe needs further evaluation is the environmental contaminant effects of leaving munitions in the subsurface. The Track 3 RI/FS remedial alternatives are discussed and weighed from the perspective of a physical explosion risk to humans, but not from a chemical contamination standpoint. The Army states that chemical contamination is being addressed separately, under the Basewide Range Assessment and Ecological Risk Assessment process. However, each of the alternatives in the Track 3 feasibility study will affect the mass of contaminants or volume of hazardous waste the Army is proposing to leave in the subsurface, and thus eventually each alternate will have a different degree of effect on the environment and the ecological community as those munitions decay and become disturbed. The Basewide Range Assessment Process depends on soil sampling to detect the presence of hazardous chemicals, but it does not account for detection of chemicals contained in unexploded and undegraded ordinance. Therefore, by relaying on the range assessment process, the environmental effects and associated future costs of leaving these munitions in the ground will not be adequately identified and discussed in the weighing of alternatives. We believe these effects and costs should be considered along with the other factors, such as the environmental benefits of limiting the area of habitat disturbance by removing less MEC, which is one of the reasons cited in support of selecting the preferred alternative.

Additionally, each of the more than 40 munition types identified in the Draft Final RI/FS, Section 3.5.3.1, has its own unique combination of physical structure and chemical content. Some attempt should be made to estimate the number and type of munitions the Army is proposing to leave in the subsurface under each of the alternatives. The eventual fate of these munitions should be discussed, including the mass of contaminants each contains, and the anticipated long-term environmental effects of those contaminants.

Response: The Draft Final RI/FS includes a summary of the status of the assessment of chemical risks to human health and the environment. The risks associated with chemical hazards to human health and the environment are being addressed as part of the Basewide Range Assessment and the Site 39 Feasibility Study Addendum, which are components of the Hazardous Toxic Waste (HTW) RI/FS program, separate from the Munitions Response RI/FS program. In the event that any evidence that ordnance found in the subsurface has degraded and leaked explosives compounds into the subsurface soils, these specific locations would be noted and evaluated to determine if additional soil sampling is warranted under the HTW program.

APPENDIX F

Comments from LeVonne Stone, Fort Ord Environmental Justice Network, Inc. P.O. Box 361, Marina, CA 939333 [February 19, 2007].

Please see attached hard copy, enclosed report submitted by Fort Ord Environmental Justice Network, Inc. for inclusion in the Administrative Records.

In addition, this report reflects additional comments from the community.

COMMENTS

Comment 1: Burning in highly populated areas, where munitions are involved should not be tolerated. The Monterey County Air District's report states that "burning the brush alone creates Dioxin, which we know to be a Cancer causing air toxin. Along with the fire starter, red Oak and Munitions, there are additional health risk to impacted residents.

Response 1: The results from air monitoring stations, located in populated areas surrounding a prescribed burn and subsequent wildfire that burned the brush from approximately 1,500 acres on the Fort Ord Impact Area in 2003, were analyzed by the Monterey Bay Unified Air Pollution Control District (MBUAPCD). Their review of the data determined that, "...dioxins, furans and several other pollutants initially of concern occurred at such insignificant levels in the resultant smoke that those compounds no longer warranted monitoring."

Subsequent prescribed burns have been and are planned to be smaller than the 2003 prescribed burn and managed in a manner that reduces the impact of smoke well below the levels experienced during the 2003 event.

The Army considers the impact of the continued presence of unexploded ordnance (UXO) on the surface of property adjacent to residential and municipal areas, and the possible transport of the UXO into those communities by trophy hunters or others, more problematic than the properly managed smoke from prescribed burning used to remove vegetation in order to locate and remove the UXO. This opinion is shared by a large number of community members who participate in the Army's environmental cleanup process and comment on related plans.

Comment 2: Any training for workers should include local impacted community members, who are being impacted by exposure to the smoke from the burns.

Response 2: The training provided by the Army to workers involved in the Fort Ord Base Realignment and Closure (BRAC) Prescribed Burn Program is for Munitions and Explosives of Concern (MEC) safety and recognition. That free training is offered to local community members and groups by the Fort Ord BRAC office as part of the community relations program. Interested community groups or

APPENDIX F

individuals may contact the community relations office at (831) 393-1284 or email Ms. Melissa Broadston at Melissa.broadston@monterey.army.mil to request this training.

Comment 3: Other alternatives should be used instead of burning. The public feels that this method is very unacceptable, especially since the temporary relocation plan was handled so unprofessionally. Poor residents have to give notice to their jobs and schools in advance, and not the day of the burn.

Response 3: The Army remains open to suggested alternatives to prescribed burning that accomplish the vegetation removal requirements within the habitat and safety restraints established by the Installation-Wide Multispecies Habitat Management Plan (HMP) and Department of Defense munitions safety standards.

Public acceptance of prescribed burning is a matter of record described in public meetings held on the subject and in regard to related plans for previous and proposed work on the former Fort Ord.

The temporary voluntary relocation program for the most recent BRAC cleanup prescribed burn in 2006 was managed by professionals for the US Army Corps of Engineers and Fort Ord BRAC. From 17 October through 19 October, Army and contracted staff took 1,489 telephone calls related to the event with instructions to make note of complaints by subject. Not a single call was recorded as a complaint about the relocation program. More than 28 local newspaper articles and TV stories were published about the preparation, conduct, and results of the event without a single mention of discontent with the related relocation program.

All local residents are subject to possible impacts from nearby prescribed burning. Those impacts are generally mild and can be addressed by taking simple, in place, precautions. The Army concurs with MBUAPCD that local residents take their recommended precautions to reduce the possible impacts of prescribed burning rather than accept the risk of accidents as well as the personal costs and difficulties involved in temporary relocation.

APPENDIX F

Comments on Draft Track 3 Impact Area Munitions Response Remedial Investigation/Feasibility Study Prepared by Environmental Stewardship Concepts, Richmond VA for Fort Ord Environmental Justice Network, Marina CA, February 19, 2007

Since comments dated October 31, 2006 to the draft version of the subject document were received by the Army from ESC and were addressed in the Response to Comments portion of the draft final version of the subject document published January 2007, it is assumed for the purpose of this response that the comments received from ESC dated February 19, 2007 although titled as comments to the draft version are applicable to the draft final version of the subject document.

These comments were prepared at the request of the Fort Ord Environmental Justice Network (FOEJN) to provide technical comment to the Army regarding the clean up of unexploded ordnance at the former base. FOEJN represents the affected community in the greater Fort Ord area in the clean up of contamination and ordnance related waste.

RECOMMENDATIONS

Comment 1: The Army should discontinue its use of prescribed burns as a method of vegetation clearance. Contrary to the claims in the report, any action that involved prescribed burns like those proposed will not gain public acceptance.

Response 1: Public acceptance of prescribed burning is a matter of record described in public meetings held on the subject and in regard to related plans for previous and proposed munitions response work on the former Fort Ord. The Army encourages the suggestion of alternatives to prescribed burning that provide an opportunity for workers to protect the public by safely removing unexploded ordnance from areas covered by protected habitat while meeting the requirements of responsible habitat management as described in the Fort Ord Installation-Wide Multispecies Habitat Management Plan (HMP).

Comment 2: All workers performing intrusive activities in the entire Fort Ord should be required to receive MEC (munitions and explosives of concern) recognition and safety training just as the workers in the Impact Area now receive.

Response 2: Munitions and Explosives of Concern (MEC) recognition and safety training is available to all property recipients of, and workers on, former Fort Ord property. The Army recommends such training for all workers performing intrusive activities on former Fort Ord property. The Army requires such training or an equivalent for all workers and visitors in restricted Munitions Response Sites (MRS). It is not within the Army's authority to require workers to accept training while operating on private or municipal property not under Army control, unless such a requirement is specifically identified as part of a selected cleanup remedy.

APPENDIX F

Comment 3: Munitions and Explosives of Concern still represent a significant risk in these areas.

Comment 3: The Army disagrees that the alternatives 2, 3, and 4 in the Draft Final Track 3 Impact Area Munitions Response Area Munitions Response Remedial Investigation/Feasibility Study (MR RI/FS) will result in a significant residual risk for a responsible property reuser. The removal MEC from the described domain of the future reuser will provide for safe, appropriate reuse of the property plus the precautions as described will be protective of the responsible reuser

DOCUMENT SUMMARY

Track 3 sites are those “areas where MEC (munitions and explosives of concern) is suspected or known to exist, but investigations are not yet complete or need to be initiated, or an area identified in the future.” These sites present a significant hazard to public health through possible exposure to unexploded ordnance. Untrained community members may be seriously injured or even killed if ordnance explodes. The Remedial Investigation and Feasibility Study (RI/FS) accomplishes two purposes. First, the Feasibility Study reviews of previous investigations and actions from which various alternatives for cleanup are identified and selected based on risk analysis and other criteria.

Using data primarily from MRS Ranges 43-48 where the prescribed burn/uncontrolled burn took place in 2003, the Army evaluated potential risks to individuals performing activities both on the ground surface and digging beneath the surface, involving significant penetration into the soil. Visual surface removals were determined to only reduce risks to individuals working on the surface to be “medium” while removals to depth reduced risks to these receptors’ risks to the lowest” designation. Individuals performing intrusive activities greater than one foot below the surface remained the “highest” designation, no matter the remedial action taken. Based on this information, the RI/FS recommends that a combination of surface removals and removals to depth (removing all identified items no matter their depth) to clean up UXO (unexploded ordnance) from within the impact area. The Army’s preferred method of vegetation clearance for these removal actions remains prescribed burning, which is not acceptable. This is a second draft of the document, where some changes have been made in response to comments from ESC and regulatory agencies such as the EPA.

GENERAL COMMENTS

General Comment 1: ESC notes and appreciates the changes made in response to our comments and those suggested by other agencies. Overall these adjustments have led to a more complete and easier to read document. However, a number of issues, particularly regarding prescribed burns have not been addressed adequately.

APPENDIX F

Response to General Comment 1: The Army appreciated the opportunity to respond to comments and concerns of the public concerning the Draft and Draft Final Track 3 Impact Area Munitions Response Area MR RI/FS.

General Comment 2: ESC's comments regarding worker MEC training were intended for basewide consideration and not just this document. Responses such as "Areas outside the Impact Area MRA are addressed under separate documents" miss the point and only make it more difficult for the community to offer significant input during the cleanup. This is a widespread problem at Fort Ord, pertaining to all areas of the base and all aspects of the cleanup. For example, to stay up to date on groundwater issues at the base, an individual must consult no less than three sets of documents. ESC is concerned that if comments can only be limited to the specific information contained in a report community involvement will suffer as a result. Comments based on information from a document pertaining to the entire cleanup should not be disregarded simply because of the document's limited scope.

Response to General Comment 2: The Army addresses comments received from community members in the most appropriate manner. No public comment received is disregarded. Public comments of a general nature to a document under review, or comments that address a subject not within the scope of the document, may be addressed within previously published material. In such cases referral of a commenter to previously published material that addresses a comment is intended to assist the commenter in obtaining the most appropriate response and additional information in the area that he/she has demonstrated an interest. Some public comments on subjects outside the area of the document being reviewed, or received after the closure of a published public comment period, may be responded to in separate correspondence. However, such comments are included in the Administrative Record and locatable by key word search so as to make that comment available to others with interests in that subject area. Responses to public comments and concerns directed to the Army that are not related to the environmental cleanup of the former Fort Ord may not be addressed directly. Such questions and concerns receive the best possible response available from the Army cleanup staff and/or may be referred to other agencies or authorities as appropriate.

The Army agrees that there is a considerable amount of published material available to the public addressing the many subject areas within the Fort Ord environmental cleanup. The Army maintains an administrative record staff and a searchable online database to assist public members interested in a specific or general subject area. The Army also produces fact sheets that provide condensed information on subjects of public interest to include references and points of contact for more information and comment. The Army holds frequent public workshops on general Fort Ord environmental cleanup topics to assist interested members of the public in understanding the technical complexities involved in

APPENDIX F

topics recommended by members of the public or areas of general public interest. Also, the US Environmental Protection Agency funds a Technical Assistance Grant (TAG) to assist public members in digesting technical environmental cleanup information.

General Comment 3: The response does not actually engage in any meaningful discussion on the topic of prescribed burns. ESC is aware of (and cited) the documents regarding the basis for the Army's continuing prescribed burns, and is more interested in how the Army intends on responding to the very specific points regarding smoke risks raised in ESC's previous comments. The Army continues to claim that these fires pose no risk to the public even though the ATSDR report this opinion was based on has been thoroughly discredited. No responses to the peer reviewed literature provided by ESC were included in the Army's reply, indicating that they refuse to engage in any sort of sustentative debate on the health risks from smoke. With this sort of non-response it raises the following question: what sort of information would sway the Army from its current position and make them see the reality of prescribed burns?

Response to General Comment 3: The Army does not contest the results of authoritative research in the area of risks associated with smoke. However, air monitoring conducted in coordination with and by the Monterey Bay Unified Air Pollution Control District confirms that smoke from prescribed burns conducted by the Army as part of the environmental cleanup of the former Fort Ord has been managed in a manner that is protective of public health.

The Army has invited authorities on the subject of smoke exposure to contribute to public meetings sponsored by the Army and to comment on proposed public information related to their area of expertise. The Army continues to assist members of the public and others in accessing authoritative research information on subjects related to the environmental cleanup of the former Fort Ord as part of the public involvement program and through links on the cleanup website.

It is the position of the Army that the conclusions and recommendations of the Health Consultation by the Agency for Toxic Substances and Disease Registry (ATSDR), February 3, 2005, addressing the impacts on local populations of a prescribed burn and subsequent wildfire involving more than 1,500 acres of native vegetation on the former Fort Ord, have not been discredited by authoritative literature.

It remains the position of the Army that the process developed for the conduct of prescribed burning on Fort Ord property in support of the removal of MEC, as described in the Draft Final Track 3 Impact Area Munitions Response Area MR RI/FS, is protective of public health due in part to the planned management of the resulting smoke in a manner so as to avoid significant impacts to residents of

APPENDIX F

surrounding communities and therefore the risks associated with prolonged exposure to significant concentrations of resulting smoke.

A review of the Administrative Record indicates that the Army is not in receipt of the “peer review literature” described as provided by ESC.

General Comment 4: The Army has refused to examine any plan such as the “crush and burn” option that may satisfy both the public’s wish to not be needlessly exposed to serious health risks and the desire to restore the chaparral to its natural state. To the public, the Army’s position appears to be that following through with predetermined plans is more important than the public’s safety. Understandably, local residents find this unacceptable. In order to start gaining the public’s trust on this issue, the Army needs to at a bare minimum acknowledge the serious risks that prescribed burns subject the public to.

Response to General Comment 4: The Army continues to consider the “crush and burn” technique of prescribed burning where the vegetation is crushed to dry out resulting in a lower flame height when later burned. However, this technique is not currently considered appropriate for vegetation removal requirements as described in the Draft Final Track 3 Impact Area Munitions Response Area MR RI/FS due to munitions safety issues involved in the crushing of vegetation in an impact area where unexploded ordnance is suspected to exist on the surface. Additionally, prescribed burn management consultants have advised the Army that this technique may result in a fuel disposition that inhibits the vertical lift of smoke otherwise created by burning the vertical stands of vegetation and thus may degrade fire management designed to reduce smoke impacts.

The Army does not consider providing for the safety of workers during the removal of unexploded ordnance “needless.” The Draft Final Track 3 Impact Area Munitions Response Area MR RI/FS is not a predetermined plan but a description of the methods and results of an investigation of an area known to contain hazardous munitions, as well as description and analysis of several alternatives to address that hazard.

The Army acknowledges the risks associated with prescribed burning on the former Fort Ord. The Army also acknowledges that appropriate fire management and contingency planning for a prescribed burn can reduce the risks to surrounding communities. In the case of prescribed burning within the impact area as described in the Draft Final Track 3 Impact Area Munitions Response Area MR RI/FS, contingency plans include the staging of contingency fire fighting resources and the installation of subsequent containment lines and fuel breaks prior to the burn, as well as fire management techniques to minimize adverse impacts and safeguard the health and property of local residents. The Army reviews all viable vegetation removal alternatives to include prescribed burning during MEC removal action planning to ensure that possible risks to local

APPENDIX F

community safety or property are addressed. The Army will take no cleanup action that is determined to present a significant risk to public health or property.

General Comment 5: ESC and FOEJN have not been the only stakeholders concerned about prescribed burns. The EPA has expressed interest in monitoring PM_{2.5}, which has a significantly lower threshold to cause adverse effects. To date, the Army has refused to monitor this major constituent of smoke. Regulatory agencies have also expressed concern that costs of prescribed burns may not be accurately reflected in the RI/FS, based on the use of MRS Ranges 43-48 as a baseline. ESC agrees with EPA that costs should be detailed as accurately as possible in the document, and that should mean including the costs of manual clearance of vegetation after burns in those estimates. Particularly since in its response to ESC's comments the Army acknowledged that such clearance would be required regardless of the success of the burn.

Response to General Comment 5: The Army has not received a request from a federal, state, or regional agency to monitor PM 2.5 during prescribed burning of vegetation associated with Track 3. The Army works with the Monterey Bay Unified Air Pollution Control District to identify air monitor requirements that are consistent with requirements identified for those conducting prescribed burning within the District.

The costs for implementation of the proposed alternatives are reflected in as much detail as possible in the Draft Final Track 3 Impact Area Munitions Response Area MR RI/FS. The cost estimates for vegetation cutting after a prescribed burn are included in the cost of MEC removal. The need for vegetation cutting after a prescribed burn is the result of technological limitations in meeting a proposed digital map of subsurface anomalies in the cleanup area. The post-burn vegetation cutting is part of the MEC removal action identified in alternatives 2, 3, and 4 and not part of or a direct result of a prescribed burn.

General Comment 6: The above comments should not be construed insisting that all vegetation in these areas be manually cleared. As noted above, we are very interested in exploring other options such as the "crush and burn" method that could both aid in the reestablishment of the chaparral and remove obstructions from the surface that would interfere with the removal of MEC. For several years ESC and FOEJN have attempted to open up a meaningful discussion on this issue of only burning the vegetation in the chaparral. The Army has yet to respond in a meaningful way to FOEJN and ESC requests to discuss the matter. As stated in numerous other comments, the Community Involvement Workshop (CIW) format significantly limits public input, and cannot compare with meeting members of the community regularly on a one on one basis. This and the issue of prescribed burns have been some of the FOEJN's primary motives in pressing the Army for greater community involvement.

APPENDIX F

Response to General Comment 6: The Army continues to consider the “crush and burn” technique of prescribed burning as a possible alternative. The Army does not consider this technique appropriate for vegetation removal requirements as described in the Draft Final Track 3 Impact Area Munitions Response Area MR RI/FS due to munitions safety issues involved in the crushing of vegetation in an impact area where unexploded ordnance is suspected to exist on the surface. The application of the “crush and burn” technique of prescribed burning will not allow the targeting of specific types of vegetation and preclude the burning of others in a burn area. The technique is a modification of the disposition of the fuel from vertical to horizontal for the purpose of limiting the flame height and reducing fuel moisture so as to expand a burn prescription window. The limiting of flame height during a prescribed burn increase the opportunities for conducting a prescribed burn, but may also increase the impact of smoke from such a burn on local residents by limiting the heat generated in the burn area and therefore the height of smoke column prior to atmospheric dissipation.

The Army continuously surveys community members and stakeholders as well as community representatives and members of special interest groups to assess the performance of the Fort Ord Environmental Cleanup community relations program. The results, published in the Fort Ord community relations plan, continues to indicate that a majority of participants consider the current type, amount, and format of cleanup information exchange “about right” and many positive comments are made by members of the public regarding the Army’s efforts to engage the community in the cleanup process. Nevertheless, the Army continues to seek avenues to improve community relations. The format for community involvement in the Fort Ord environmental cleanup process was developed, and is maintained, in accordance with US EPA guidance for Superfund cleanups.

PARSONS

Contract No. DACA05-00-D-0003

The view, opinions, and/or findings contained in this report are those of the author(s) and should not be construed as an official Department of the Army position, policy, or decision, unless so designated by other documentation.

CHAPTER 8

SPECIAL-CASE AREAS AND NON-COMPLETED AREAS

The portions of the MRS-Ranges 43-48 removal area that have been designated as SCAs and non-completed areas should be evaluated before future action. The following sections describe each area, explain why the area received SCA or non-completed designation, and recommend follow-up action. Table 8-1 lists the grids included in each area and summarizes the reasons for the designations along with associated precautions and recommendations. Map 8-1 shows the locations of the SCAs and non-completed areas.

As discussed in Section 4.5, geophysical transect sampling conducted before performing analog removal or digital geophysical surveys provided samples of the grids to provide a preview of conditions. By showing the approximate locations of areas with high anomaly density, this sampling helped determine where to deploy survey teams and where anomaly density would make removal actions too time consuming, too expensive, or too damaging to the habitat to be within the scope of work. Three such high-density areas were among the SCAs in MRS-Ranges 43-48: Ranges 44, 47, and 48.

8.1 RANGE 48

This nearly 139-acre SCA includes 656 grids in the western portion of MRS-Ranges 43-48. Numerous targets and dense munitions debris resulting from heavy range use will require intensive removal efforts. Such actions exceeded the scope of funding and available time in this contract. Based on transect sampling in the area, recommended follow-up actions include a combined approach using a dual-tool method with multiple areas requiring significant excavation in combination with mechanical sifting (or remote control). Potential impacts to the habitat would need to be evaluated and considered before performing such actions. For example, extensive erosion control with environmental restoration may be necessary.

8.2 RANGE 47

The 66 grids of this former 40mm range encompass just over 15 acres. Heavy saturation of this SCA with munitions and RRD will require intensive removal efforts that exceed the scope of this contract. Recommended follow-up actions include excavation in combination with mechanical sifting (or remote control) followed by digital survey. Potential impacts to the habitat would need to be evaluated and considered before performing such actions. For example, erosion control and environmental restoration may be necessary.

8.3 RANGE 45 TRENCH

Five grids on 1.2 acres in the Range 45 SCA contain a target box trench with pop-up targets lying below the depth of the scraping and sifting operation. USACE guidance was to leave the trench and targets in place because excavation and removal would have exceeded the scope of the current contract. The recommended action is to use a backhoe or other earthmoving machinery to excavate the trench in accordance with the backhoe SOP in Appendix G of the PWP [Ref. 4], and then perform a subsurface MEC removal followed by QC/QA inspections. If no follow-on removal action is taken, construction support should be required for any intrusive actions in the area of the target trenches.

8.4 RANGE 44

This former antitank/antiarmor range includes approximately 82 grids covering almost 19 acres in Range 44. Because of heavy amounts of debris from targets and ammunition, removal would take more time and funding than in this contract's scope. Recommended action includes a combined approach using dual-tool method with localized mechanical sifting (or remote control). Potential impacts to the habitat would need to be evaluated and considered before performing such actions. For example, limited erosion control and environmental restoration may be necessary.

8.5 CENTRAL AREA GRIDS

This area, composed of 37 grids scattered within the southern portion of the interior of Ranges 43-48 totaling approximately 8.5 acres, received no analog or digital removal. It received a lower-priority from the USACE due to time and funding limitations of the contractual scope. Recommended follow-up action involves performing subsurface MEC removal followed by QC/QA inspections.

8.6 EAST SIDE GRIDS WITH NO SUBSURFACE REMOVAL

Although this area of 212 grids on approximately 46 acres contains no range fan, it is an extension beyond the Range 43 fan and as a result contains munitions debris. USACE gave it a lower priority due to time and funding limitations of the contractual scope, and the area therefore received surface removal but no subsurface removal operations. Recommended follow-up action involves performing subsurface MEC removal followed by QC/QA inspections.

8.7 SUBSURFACE REMOVAL COMMENCED

Two grids among the Central Area Grids (B2I9F1 and B2I9E1) and one among the East Side Grids with No Surface Removal (B2J9A8) received analog removal but no digital operations. Totaling 0.7 acres, these grids received a lower priority from the USACE due to time and monetary limitations of the contractual scope. Recommended follow-up action involves performing subsurface MEC removal followed by QC/QA inspections.

8.8 EAST SIDE GRIDS WITH PARTIAL SUBSURFACE REMOVAL

The USACE gave seven grids (1.6 acres, among the East Side Grids with No Surface Removal) lower priority due to time and monetary limitations of the contractual scope. These grids received analog removal and digital survey but no reacquisition or digital anomaly investigation and no QC or QA. Because anomalies have been selected, the recommended action is to perform reacquisition and excavation on the seven grids followed by QC and QA inspections.

8.9 BUNKER

This concrete observation bunker (approximately 80 feet long, 30 feet wide, and up to 12 feet high) protected observers checking the accuracy and effects of HE artillery rounds impacting the ground. Affecting 0.7 acres, it was built on a hillside within grids B2H8G0, B2H8F0, B2H9F1, and B2H9G1. Analog and digital removal operations were performed as close to the structure as possible in grids B2H8G0, B2H8F0, and B2H9F1 until the steel rebar interfered with the instruments. Grid B2H9G1 received surface removal only. Analog removal was performed up to approximately 10 to 20 feet from the bunker; digital operations using the EM-61 got within 65

1 feet north of bunker and 15 feet to the south and west. The east end is in grid B2H9G1, and
2 could probably be cleared to within 10 to 20 feet as well. Recommended action would involve
3 removing the bunker, then performing subsurface MEC removal followed by QC/QA inspections
4 over the entirety of the four affected grids to ensure that the grids have received removal
5 operations.

6 **8.10 FENCELINE**

7 This 3.5-acre area runs approximately 2,000 linear feet along Eucalyptus Road and includes 28
8 grids or partial grids in a buffer extending 25 feet in from the fence line. The metallic fence
9 interfered with the analog and digital instruments in areas within 5 to 15 feet of the fence.
10 Recommended action includes removing the fence along Eucalyptus Road and subjecting the 25-
11 foot-wide corridor inside the site boundary to subsurface MEC removal and QC/QA inspection.
12 During this work, site security measures would need to be implemented (e.g., temporary fences,
13 barriers, and/or security patrols) to maintain public safety.
14

Table 8-1 — SCA Summary Table for Ranges 43-48 Interim Action

SCA / Non-Completed Area Name	Grids	Reason for SCA	Precautions	Rationale	Recommendation
Range 47	C2A6F3, C2A6E4, C2A6D5, C2A6D6, C2A6D7, C2A6D8, C2A6D9, C2A6C5, C2A6C6, C2A6C7, C2A6C8, C2A6C9, C2A6C0, C2A6B4, C2A6B5, C2A6B6, C2A6B7, C2A6B8, C2A6B9, C2A6B0, C2A7B1, C2A7B2, C2A6A4, C2A6A5, C2A6A6, C2A6A7, C2A6A8, C2A6A9, C2A6A0, C2A7A1, C2A7A2, C2A7A3, C2A7A4, C2A7A5, B2J6J5, B2J6J6, B2J6J7, B2J6J8, B2J6J9, B2J6J0, B2J7J1, B2J7J2, B2J7J3, B2J7J4, B2J7J5, B2J6I6, B2J6I7, B2J6I8, B2J6I9, B2J6I0, B2J7I1, B2J7I2, B2J7I3, B2J7I4, B2J6H8, B2J6H9, B2J6H0, B2J7H1, B2J7H2, B2J7H3, B2J6G0, B2J7G1, B2J7G2, B2J7G3, B2J7F1, B2J7F2, B2J7F3, B2J7E2	The decision to designate this area as an SCA was based on the high density of subsurface anomalies and the need to sift the area.	Access is restricted – enter this area only with an authorized UXO escort. Do not excavate or otherwise intrude below the soil surface without an authorized UXO escort.	40mm grenades were used in this range and continue to present a hazard.	Sift area to depth of 2 feet followed by digital survey. Potential impacts to habitat would need to be evaluated and considered before performing such actions.
Range 45 Trench	C2B7A0, C2B8A1, C2A7H0, C2A8H1, C2A8H2	The decision to designate this area as an SCA was based on instrument interference and because the probability of subsurface MEC was considered low.	Do not excavate or otherwise intrude below the soil surface without an authorized UXO escort.	Investigations detected buried target boxes and associated materials that were not removed under this action. These materials may have masked the presence of additional MEC in the area.	The remaining anomalies are suspected to be related to buried target boxes; therefore, future development should include construction support in these grids.
Range 44	C2A8G6, C2A8G7, C2A8F5, C2A8F6, C2A8F7, C2A8E5, C2A8E6, C2A8E7, C2A8E8, C2A8D4, C2A8D5, C2A8D6, C2A8D7, C2A8D8, C2A8C4, C2A8C5, C2A8C6, C2A8C7, C2A8B5, C2A8B6, C2A8B7, C2A8A5, C2A8A6, C2A8A7, B2J8J4, B2J8J5, B2J8J6, B2J8J7, B2J8I4, B2J8I5, B2J8I6, B2J8H3, B2J8H4, B2J8H5, B2J8H6, B2J8G3, B2J8G4, B2J8G5, B2J8G6, B2J8F3, B2J8F4, B2J8F5, B2J8F6, B2J8F9, B2J8E9, B2J8E0, B2J8D9, B2J8D0, B2J8C9, B2J8C0, B2I8I1, B2I8I2, B2I8I3, B2I7H9, B2I7H0, B2I8H1, B2I8H2, B2I7G9, B2I7G0, B2I8G1, B2I8G2, B2I7F0, B2I8F1, B2I8F2, B2I8E1, B2I8E2,	The decision to designate this area as an SCA was based on the high density of surface debris (i.e., antitank rockets and 35mm sub cal) and high density of subsurface	Do not excavate or otherwise intrude below the soil surface without an authorized UXO escort.	No subsurface removal work was conducted, yet MEC was found during the surface removal of this area and in the subsurface of adjacent areas and is suspected to exist in	Although surface removal was accomplished previously, surface removal is recommended in this area due to soil erosion. If removal to depth is considered, the follow-up actions include a combined approach using dual-tool

1.0 INTRODUCTION

This volume of the Track 3 Impact Area Munitions Response Area (MRA), Munitions Response Remedial Investigation/Feasibility Study (RI/FS; Track 3 Impact Area MRA RI/FS) report presents the Feasibility Study that identifies and selects a preferred remedial alternative to address Munitions and Explosives of Concern (MEC) risks at the portion of the Impact Area MRA that is currently designated for transfer to Bureau of Land Management (BLM) as Habitat Reserve in the *Installation-Wide Multispecies Habitat Management Plan* (HMP; USACE, 1997) and additional requirements (USACE, 2005; USFWS, 1999, 2002, 2005; BLM, Army; 2004; Zander, 2002; 2007) (Plates 1 and 2; RI, Volume I). Track 3 Sites are those areas where (1) MEC are suspected or known to exist, but investigations are not yet complete or need to be initiated, or (2) any suspected or known areas identified in the future. The Impact Area MRA qualifies as a Track 3 site because MEC exist and actions have not been completed. The results of this Feasibility Study will be used to support the Track 3 Impact Area MRA RI/FS Proposed Plan and Record of Decision (ROD) that will document the results of the Remedial Investigation and Risk Assessment (RI and RA; Volume I) and this Feasibility Study (FS; Volume II). This Final report was revised based on comments received on the draft final report. The comments and associated responses are provided in Appendix F of the RI (Volume I).

1.1 Purpose and Objectives

The purpose of this FS is to develop and select remedial alternatives to address potential MEC risks at the Track 3 Impact Area Munitions Response Area (Impact Area MRA). As described in the RI (Volume I; Section 1.1), the MR RI/FS only addresses the physical or explosive risk from MEC to humans. Based on many years of site experience, the presence of MEC in the Impact Area MRA does not appear to be a concern in terms of physical risks to ecological receptors. Several iterations of biological resource evaluations and many years of monitoring show that the ecological environment in the Impact Area MRA is healthy and thriving. The U.S. Department of the Interior, Fish and Wildlife Service (USFWS) has designated the entire Impact Area MRA as critical habitat necessary for the continued existence of Monterey spineflower, a federally threatened annual plant. Potential human health and ecological risks related to any soil contamination from small arms and military munitions ranges are being addressed under the Basewide Range Assessment (*Shaw/MACTEC, 2006*) and the Site 39 Feasibility Study Addendum (*MACTEC, 2007*). The objectives of this FS are to describe the process used to develop, evaluate, compare and select a preferred alternative that will meet the Remedial Action Objectives (RAOs) based on the results of the RI and RA (Volume I) for this area as shown on Figure 1.

1.2 Report Organization

This FS report is organized as follows:

Section 1.0: Introduction—Describes the purpose and objectives of the Impact Area MRA FS process and report organization.

Section 2.0: Remedial Approach—Defines the Impact Area MRA for which remedial alternatives will be developed in the FS, and describes the RAOs; the application of risk assessment results; potential Applicable or Relevant and Appropriate Requirements (ARARs); land use control guidelines that will be applied in the development of remedial alternatives; and ongoing and future MEC-related activities at the former Fort Ord that are components of the Army's basewide efforts under the Army's Munitions

Response (MR) Site Security Program to promote MEC safety because of Fort Ord's history as a military base.

Section 3.0: Identification of Applicable Response Actions—Identifies the range of applicable response actions for MEC risk management at the Impact Area MRA that include no further action; land use controls; and MEC remediation.

Section 4.0: Development of Remedial Alternatives—Describes the Long Term Management Measures specific to implementation and management of the remedial alternatives selected for the Impact Area MRA; identifies the response action components considered in the development of remedial alternatives as shown on Figure 1; describes the four potential remedial alternatives developed for the Impact Area MRA; and identifies potential ARARs associated with their implementation.

Section 5.0: Evaluation and Comparison of Remedial Alternatives—Presents the nine Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) evaluation criteria specified in the U.S. Environmental Protection Agency's (EPA's) RI/FS Guidance (*EPA, 1989*), and the evaluation and comparison of the four remedial alternatives developed for the Impact Area MRA.

Section 6.0: Selection of Preferred Remedial Alternative—Identifies the preferred remedial alternative for the Impact Area MRA based on the evaluation and comparison of alternatives, and provides the rationale for its selection.

Section 7.0: Approval Process—Describes the approval process for documenting the preferred alternative for implementation at the Impact Area MRA in the RI/FS Proposed Plan and ROD.

Section 8.0: References—Provides a list of references to pertinent documents cited in this report.

2.0 REMEDIAL APPROACH

This section describes the general remedial approach applied at the Impact Area MRA, including (1) how the results of the RI and RA are used to define the area for which remedial alternatives are developed; (2) the RAOs, potential ARARs, and land use control guidelines that will be considered in the development and analysis of remedial alternatives; and (3) Long Term Management Measures that will be applied to implement and manage the remedial alternatives selected for the Impact Area MRA.

The RI/FS process as outlined in the EPA's *Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA* (EPA, 1989) (EPA's RI/FS Guidance) represents the methodology that the Superfund program has established for characterizing the nature and extent of risk posed by contaminated sites and for evaluating potential remedial options. This FS was prepared based on the process outlined in the Guidance; however, it was adapted to fit the unique circumstances of the Impact Area MRA as described below.

Remedial Investigation

The general premise of the RI process is that contamination exists at a site for which an initial investigation is required to define the nature and extent of the contamination. For the Impact Area MRA being evaluated in this RI/FS, however, MEC is known to be present as described in the RI and defined under Track 3, but the majority of the area is inaccessible for MEC investigations due to the presence of dense vegetation that prevents the safe operation of MEC investigation or removal equipment. Therefore, the purpose of the RI in this case was to evaluate the available data from MEC investigations and removal actions already conducted in the Impact Area MRA, and verify adequate MEC-related data was available to perform the subsequent RA and FS. The RI determined adequate MEC-related data was available to perform the subsequent RA and FS for the Impact Area MRA.

Risk Assessment

The general premise of the RA process is that contamination exists at a site at concentrations that can be compared to risk-based levels considered protective of human health and the environment. In order to quantify potentially remaining risks, protective risk-based levels are typically translated into site-wide cleanup levels. A range of remedial alternatives are then developed and compared in the FS based on their ability to achieve the site-wide cleanup levels and other RAOs. For the Impact Area MRA being evaluated in this RI/FS, site-wide cleanup levels cannot be developed to quantify potentially remaining MEC risks. In this case, a unique Fort Ord Ordnance and Explosives Risk Assessment Protocol (protocol; *Malcolm Pirnie, 2002*) was developed to estimate potential MEC risks (Overall MEC Risk Scores) for each receptor expected to be present at Munitions Response Sites or Areas (MRSs or MRAs) at the former Fort Ord. This protocol was applied to the Impact Area MRA as described in the RA (Section 4.0; Volume I), and potential MEC risks both prior to (Baseline MEC Risks) and during reuse (After Action MEC Risks) of the Impact Area MRA were estimated for different receptor groups (e.g., surface reusers such as visitors or habitat monitors, and those reusers that would be expected to intrude below ground surface such as construction workers and habitat workers) expected to be present based on hypothetical assumptions presented in the RI and RA. After remedial actions have been conducted, residual After Action MEC Risks may be re-evaluated using site-specific MEC removal data, and will be considered in verifying the appropriateness of Land Use Controls selected for implementation.

As described in the RI (Volume I; Section 1.1), the MR RI/FS only addresses the physical or explosive risk from MEC. Potential human health and ecological risks related to any soil contamination from small arms and military munitions ranges are being addressed under the Basewide Range Assessment (Shaw/MACTEC, 2006) and the Site 39 Feasibility Study Addendum (MACTEC, 2007).

Feasibility Study

The general premise of the FS process is that a range of remedial alternatives can be developed, evaluated, and compared based on their ability to achieve site-wide cleanup levels and other RAOs. For the Impact Area MRA being evaluated in this RI/FS, potential After Action MEC Risks were estimated in the RA for each of a range of site-specific reuse receptors, rather than on a site-wide basis. Therefore, the remedial alternatives evaluated in this FS were developed to provide overlapping management of potentially remaining MEC risks for the range of reuse receptors anticipated to be present at the Impact Area MRA after MEC remedial actions are implemented.

2.1 Definition of Impact Area MRA

The Impact Area MRA addressed in this FS is the portion of the Impact Area that is currently designated for transfer to Bureau of Land Management (BLM) as Habitat Reserve in the *Installation-Wide Multispecies Habitat Management Plan* (HMP; USACE, 1997) and additional requirements (USACE, 2005; USFWS, 1999, 2002, 2005; BLM, Army; 2004; Zander, 2002; 2007), including the Eucalyptus Fire Area and the Watkins Gate Burn Area (Plate 2). Range 30A and a portion of Ranges 43 through 48 are included within the boundaries of the Impact Area MRA (Plate 2). These ranges were previously identified for Interim Action in the Interim Action Record of Decision (Army, 2002). Because these sites are part of the Impact Area MRA they are being re-evaluated as part of this RI/FS, and decisions made as part of this evaluation will act as the final remedial decisions for these ranges.

This Final report was revised based on comments received on the draft final report. The comments and associated responses are provided in Appendix F to the RI (Volume I). This RI/FS addresses only the physical hazards to humans from MEC. The chemical hazards are being addressed under the Basewide Range Assessment (BRA) (Shaw/MACTEC, 2006) and Site 39 Ranges Feasibility Study (MACTEC, 2007).

The Impact Area MRA is located in the southwestern portion of the former Fort Ord, and covers approximately 6,560 acres of the 8,000 acre historical Impact Area that is currently designated for transfer to BLM as Habitat Reserve. The Impact Area MRA is within the former Fort Ord Impact Area and was previously the location of the Fort Ord Range Complex, which was used for live fire training exercises with a variety of weapons. The Impact Area MRA includes all of MRS-BLM, and a portion of MRS-Ranges 43 through 48. The Eucalyptus Fire Area (367 acres) and Watkins Gate Burn Area (1,005 acres) are parts of MRS-BLM.

Areas of the historical Impact Area that are identified for development include MRS-15 SEA 01 through 04; MRS-15 DRO 01, DRO 01A, DRO 02, and DRO 02A; MRS-15 MOCO 01 and 02; MRS-46; MRS-47; the Monterey Peninsula College (MPC) designated portions of MRS-Ranges 43 through 48 including a small development portion and area designated as Habitat Reserve; BLM Headquarters (MRS-35) including Parcel F1.12; and the Military Operations Urban Terrain (MOUT) (MRS-28). These areas are not evaluated in this RI/FS.

As described in the RI, the Impact Area MRA is entirely within the natural resources management area described in the HMP as “habitat reserve” areas. The HMP was prepared in accordance with the U.S. Fish and Wildlife Service (USFWS) Biological Opinions (USFWS, 1993, 1997a, b). Changes to the HMP have also been documented since it was published, including additional Biological Opinions (USFWS, 1999, 2002, 2005), an Assessment (Zander, 2002), a Memorandum of Understanding (BLM, Army, 2004), a Revised Attachment A Habitat Management Plan Map (USACE, 2005), and additional requirements anticipated during reuse described in the Draft Installation-Wide Multispecies Habitat Conservation Plan for Former Fort Ord, California (HCP; Zander, 2007). The HMP and these additional requirements establish the guidelines for the conservation and management of wildlife and plant species and habitats that largely depend on former Fort Ord land for survival, and describe land use, conservation, management, and habitat monitoring requirements for target species within habitat reserve areas that comprise the Impact Area MRA, as well as development areas. Habitat management in the Impact Area MRA is essential to the protection and management of habitat reserve species, and is vital to the reuse of the former Fort Ord because it balances the species losses in other areas of the former Fort Ord that are designated for development.

Plate 5 shows the Fort Ord plant communities that are present within the Track 3 Impact Area MRA. The dominant community is the central maritime chaparral that covers about 6,066 acres of the Impact Area MRA. Other communities include the inland coast woodland community that comprises about 199 acres of the site, the grassland community (about 256 acres), and the wetland community that comprises about 24 acres of the site. A small portion of the site has been developed. Listed species present in the Impact Area MRA include the California tiger salamander (*Ambystoma californiense*), sand gilia (*Gilia tenuiflora* ssp. *arenaria*), California goldfields (*Lasthenia conjugens*), Monterey spineflower (*Chorizanthe pungens* var. *pungens*), and Seaside bird’s beak (*Cordylanthus rigidus* var. *litteralis*) including critical habitat designated for Monterey spineflower.

Among the more than 260 vertebrates known to occur or potentially occur at the former Fort Ord some are considered special-status species, as documented in the Fort Ord Draft Basewide Biological Inventory, Fort Ord, California, dated December 8, 1992. These wildlife species, in addition to plant species and native biological communities, are collectively called special status natural resources. They receive various levels of protection under local, state, or federal laws, regulations, and codes. The closure and disposal of former Fort Ord is considered a major federal action that could affect several species of concern and other rare species listed by the California Department of Fish and Game and/or the California Native Plant Society or listed as threatened or endangered under the federal Endangered Species Act (ESA). The U.S. Department of the Interior, Fish and Wildlife Service (USFWS) final Biological Opinion for the Disposal and Reuse of Fort Ord (USFWS, 1993) required that a HMP be developed and implemented to reduce the incidental take of listed species and loss of habitat that supports these species.

Other subsequent biological opinions (USFWS, 1999, 2002, 2005) addressed reasonable and prudent measures to mitigate impacts to listed species and critical habitat for species such as the California tiger salamander, California goldfields, and Monterey spineflower. The HMP, the Biological Opinions mentioned above, as well as an Assessment (Zander, 2002), a Memorandum of Understanding (BLM/Army, 2004), and a Revised Attachment A Habitat Management Plan Map (USACE, 2005) establish the guidelines for the conservation and management of wildlife and plant species and habitats that largely depend on former Fort Ord land for survival.

Within the Impact Area MRA, fuel breaks, access roads, and trails have been cleared of vegetation and/or MEC over time, with varying degrees of vegetation regrowth, ground surface accessibility, and extent of MEC removal (Plate 2). These fuel breaks and roads are essential to habitat reserve management and maintenance activities and accessibility for fire fighting activities. In addition, site security measures are

in place to limit access to the Impact Area MRA, including maintenance of existing 4-strand barbed wire perimeter fence with signs, and periodic safety patrols of the perimeter.

The currently identified future recipient of the Impact Area MRA property is BLM. A habitat conservation plan (HCP) for the former Fort Ord is being developed in coordination with BLM, the Fort Ord Reuse Authority (FORA), and other property recipients. The *Draft Installation-Wide Multispecies Habitat Conservation Plan* (Draft HCP; Zander, 2007) currently identifies the following reuse activities anticipated to occur within the Impact Area MRA:

- Route, road, and trail management and maintenance;
- Habitat enhancement;
- Fuel Break construction and management;
- Use of administrative areas;
- Habitat monitoring;
- Educational programs;
- Species specific monitors and habitat enhancement; and
- Recreational access on established routes.

2.2 Definition of Remedial Action Objectives

The primary remedial action objectives (RAOs) for the Impact Area MRA consistent with EPA's RI/FS Guidance (EPA, 1989) are to achieve the EPA's threshold criteria of "Overall Protection of Human Health and the Environment" and "Compliance with ARARs". These RAOs include supporting the reuse of the Impact Area MRA as a habitat reserve in compliance with guidelines and requirements for habitat reserve management and monitoring set forth in the HMP, Biological Opinions, and additional documents discussed above (USACE, 1997, 2005; USFWS, 1999, 2002, 2005; BLM, Army, 2004; Zander, 2002; 2007).

As described in EPA's *Land Use in the CERCLA Remedy Selection Process* (EPA, 2000b), "Remedial action objectives provide the foundation upon which remedial cleanup alternatives are developed. In general, remedial action objectives should be developed in order to develop alternatives that would achieve cleanup levels associated with the reasonably anticipated future land use over as much of the site as possible. EPA's remedy selection expectations described in section 300.43.0 (a) (1) (iii) of the National Contingency Plan (NCP) should also be considered when developing remedial action objectives. Where practicable, EPA expects to treat principal threats, to use engineering controls such as containment for low-level threats, to use institutional controls to supplement engineering controls...."

In keeping with EPA's expectations above, based on the planned reuse of the Impact Area MRA as habitat reserve as described in the RI (Volume I), the Army intends to (1) treat the principal threats at the Impact Area MRA (i.e., conduct MEC remedial actions), and (2) consider institutional controls (herein referred to as Land Use Controls) in the development of remedial alternatives for managing any potentially remaining MEC risks after treatment of principal threats.

These RAOs will be achieved through development of alternatives for the Impact Area MRA that (1) apply the results of the risk assessment to guide selection of risk management measures to mitigate potentially remaining MEC risks, and (2) comply with ARARs and other guidelines. A discussion of these components and their consideration in the development of remedial alternatives for the Impact Area MRA is presented below.

2.2.1 Application of Risk Assessment Results

As part of the basewide MR RI/FS process for the former Fort Ord, the Army is required to conduct a MEC risk assessment as part of the RI/FS process for munitions response sites (MRSs) at the former Fort Ord. According to CERCLA, the results of the risk assessment should help establish acceptable remediation goals (e.g., cleanup levels) for use in developing remedial alternatives during the FS. Section 4.0 of the RI (Volume I) presents the results of the MEC risk assessment that addresses the explosive hazards associated with MEC in the Impact Area MRA. It also provides a summary of the status of the assessment of chemical risks to human health and the environment. The risks associated with chemical hazards to human health and the environment are being addressed under the Basewide Range Assessment (BRA) program (*Shaw/MACTEC, 2006*) and Site 39 Ranges Feasibility Study (*MACTEC, 2007*), which are components of the Hazardous Toxic Waste (HTW) RI/FS program, separate from the Munitions Response RI/FS program. The explosive risks to plants and animals were not addressed in the Fort Ord Ordnance and Explosives Risk Assessment Protocol. The Army has been evaluating and managing the habitat at the former Fort Ord, as well as investigation and cleaning up MEC, since the base was listed for closure in the early 1990s. Based on many years of site experience, the presence of MEC in the Impact Area MRA does not appear to be a concern in terms of physical risks to ecological receptors. Several iterations of biological resource evaluations and many years of habitat monitoring show that the ecological environment is healthy and thriving. The site was used as a multi-range impact area for over 80 years, yet it still supports high diversity of plants and animals, including species considered rare, threatened and endangered. Based on Base Realignment and Closure Cleanup Team (BCT) concurrence, the explosive risks to plants and animals were not specifically addressed in the Track 3 RI/FS. The potential risks to the environment from explosive hazards associated with MEC in the Impact Area MRA will be addressed through compliance with ARARs and measures described above and in Section 3.0 that are considered protective of biological resources.

The MEC risk assessments for Fort Ord provide a qualitative description of the potential risks of a receptor encountering a MEC item. Because the nature of these types of risk assessments is largely qualitative, a specific protocol was developed to evaluate potential current and future MEC risks at Fort Ord. The Fort Ord Ordnance and Explosives Risk Assessment Protocol (protocol) (*Malcolm Pirnie, 2002*) was developed through the combined effort of the Army, Department of Toxic Substances Control (DTSC), and EPA, and allows for a comparative review of potential MEC risks at impacted sites. Unlike typical risk assessments that evaluate potential exposures to hazardous substances in environmental media, the protocol does not calculate a numerical probability of adverse effects or a hazard index. Rather, it relies on an *a priori* assumption that any encounter with MEC will result in an adverse effect, and provides a qualitative description of the risk based on the likelihood of encountering a MEC item combined with the potential of the item to cause a serious injury if detonated. Unlike standard risk assessments for evaluating hazardous substances, the protocol does not provide input into the development of cleanup levels or remedial objectives. Rather, these qualitative overall MEC Risk Scores are used in this FS to guide the comparative evaluation of various remedial alternatives as described in Section 5.0.

The output of the risk assessment consists of an overall MEC Risk Score designated by the letters A through E, with A representing the lowest risk and E representing the highest risk, for each potential receptor as follows:

Overall MEC Risk Score	A	B	C	D	E
	Lowest	Low	Medium	High	Highest

The proposed reuses for the Impact Area MRA are discussed in the RI (Volume I, Section 2.2.3.3), and include native habitat for ecological species, and non-motorized recreational uses (hiking, biking, and equestrian). Receptors expected to be associated with the planned reuses have been divided into five main groups (described in Section 4.0 and summarized on Table 4.1 of the RI; Volume I) which include (1) trespassers, (2) surface only receptors, (3) shallow intruding receptors, (4) deeper intruding receptors, and (5) construction workers. A description of each receptor evaluated in the Impact Area MRA risk assessment, and the associated activities and exposure assumptions is presented in Table 4.1 of the RI (Volume I).

For the Impact Area MRA Risk Assessment (RA; Section 4.0, Volume I), both “Baseline” (prior to MEC removal) and “After Action” (after MEC removal) reuse conditions were evaluated. Overall potential MEC Risk Scores were developed for the MRA for the baseline scenarios and after-action reuse scenarios and multiple anticipated “receptors” assumed to be present at the MRA.

The RA for the Impact Area MRA assumed two different MEC removal actions could be implemented to address potential MEC risks: (1) a technology-aided surface MEC removal (with MEC detection instruments available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible), and (2) a subsurface MEC removal (to depths at which MEC is found). In general, the results of the RA indicated MEC removal actions would decrease the overall MEC risks for the majority of the receptors evaluated to varying degrees depending on (a) the type of removal action implemented (i.e., surface versus subsurface MEC removals), and (b) whether the receptor was assumed to intrude below ground surface (bgs), and to what depth (e.g., surface only, to a depth of 1 foot bgs, deeper than 1 foot bgs). The following conclusions can be made based on the results of the risk assessment (Section 4.0; Volume I):

- The potential Baseline MEC Risks for all receptors are highest risk (E). This score is based on the types and densities of MEC removed during the MRS-Ranges 43 through 48 Interim Action. The use of this data is considered conservative because it is expected that areas between range fans throughout the Impact Area MRA will have lower MEC densities than were present within MRS-Ranges 43 through 48.
- The potential After Action MEC Risks associated with a technology-aided surface MEC removal (with MEC detection instruments available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible) are highest risk (E) for all intruding receptors and a medium risk (C) for surface only receptors. It was assumed that all MEC encountered on the surface would be removed.

- The potential After Action MEC Risks associated with a subsurface MEC removal for all receptors intruding below 1 foot remain highest risk (E). For shallow intruding receptors (those intruding less than 1 foot) and surface only receptors, the risk is lowest (A). It was assumed that all MEC encountered and detected on the surface and below ground surface would be removed. However, based on the potential limitations of the detection equipment and procedures, it would not be possible to verify that all MEC items were removed to all depths. Therefore, for the subsurface MEC removal scenario, the risk assessment assumed nearly all items would be removed in the top 1 foot below ground surface, and some MEC would remain below a depth of 1 foot below ground surface.

Based on the risk assessment, it is anticipated that unrestricted use that would allow unrestricted intrusive activities will be unacceptable after conducting either surface or subsurface MEC removals. Note that a potential residential receptor that could be expected to have intrusive activities as deep as 4 to 5 feet would have similar risk scores as a construction worker (potential After Action MEC Risk is E). Therefore, an unrestricted land use, typically represented by a residential exposure scenario by the regulatory agencies, would be prohibited. Appropriate land use controls would be necessary for proper management of any potential residual MEC risks. As described in Section 2.2, the objective of the remedial alternatives evaluation presented in this FS is to support the reuse of the Impact Area MRA as a habitat reserve. The HMP and additional requirements designate the entirety of the Impact Area MRA as a Natural Resource Management Area, and the Fort Ord Reuse Plan (as updated) designates the entirety of the Impact Area MRA as a Habitat Reserve.

Although surface and subsurface MEC removals would result in eliminating many MEC items from the site and reducing the possibility of future exposures, it would not be possible to verify all MEC items were removed to all depths. Therefore, a possibility would remain that an intruding receptor could encounter a MEC item. The results of the risk assessment indicate that potential After Action MEC Risk scores would remain in the high range for those receptors conducting intrusive activities. Therefore, land use controls will be evaluated as part of remedial alternatives to support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management). These land use controls will allow for proper management of the habitat reserve as described in the HMP and additional requirements.

As described in the EPA's guidance *Handbook on the Management of Ordnance and Explosives at Closed, Transferring, and Transferred Ranges and Other Sites* (EPA, 2002), if MEC is potentially present at a site or area, and in this case, potential MEC risks are estimated as requiring a response action, the response action may include: (1) institutional controls; (2) MEC-related monitoring; (3) containment of MEC (i.e., physical barriers); or (4) MEC removal or treatment. The following sections describe potential ARARs and other guidance considered in the development and evaluation of remedial alternatives for the potential response actions to address the presence of MEC and associated potential MEC risks estimated in the RA for the Impact Area MRA.

2.2.2 Potential Applicable or Relevant and Appropriate Requirements (ARARs)

This section presents a general description and analysis of ARARs. Potential federal and state ARARs that may be pertinent to implementation of the remedial alternatives developed and retained for analysis for the Impact Area MRA are presented in Table 1. For each of the remedial alternatives described in Section 4.0, their compliance with ARARs are evaluated and compared in Section 5.0.

Section 121 of CERCLA requires that site cleanups comply with federal and state laws that are “applicable or relevant and appropriate requirements” (ARARs). Under CERCLA Section 121(d)(2), the

federal ARARs for a remedial action could include requirements under any of the federal environmental laws. State ARARs include promulgated requirements under state environmental or facility siting laws that are more stringent than federal ARARs, and that have been identified in a timely manner, pursuant to 40 Code of Federal Regulations (CFR) Part 300.400(g)(4). A requirement may be either “applicable” or “relevant and appropriate”.

2.2.2.1 Types of ARARs

In general, ARARs that govern actions at CERCLA sites fall into three broad categories based upon the chemical contamination present, site characteristics, and alternatives proposed for cleanup (*EPA, 1993*). These three categories (chemical-specific, location-specific, and action-specific) and additional “To-Be-Considered” requirements are described below.

Chemical-Specific ARARs

Chemical-specific ARARs include those environmental laws and regulations that regulate the release to the environment of materials with certain chemical or physical characteristics or that contain specified chemical compounds. These requirements generally set health or risk-based concentration limits or discharge limits for specific hazardous substances by media. Chemical-specific ARARs are triggered by the specific chemical contaminants found at a particular site. Examples of potential chemical-specific ARARs are effluent limitations, emission limitations, drinking water standards, and hazardous waste characteristics identified for specific chemicals and compounds. A more stringent standard, requirement, criterion, or limitation promulgated pursuant to a state environmental statute and identified in a timely manner is also a potential ARAR.

Location-Specific ARARs

Location-specific ARARs govern activities in certain environmentally sensitive areas. These requirements are triggered by the particular location and the proposed activity at the site. An example of a location-specific ARAR is compliance with the Endangered Species Act of 1973, as amended, to avoid sensitive ecosystems or habitats. Location-specific ARARs also focus on wetland or floodplain protection areas, or archaeologically significant areas.

Action-Specific ARARs

Action-specific ARARs are restrictions that define acceptable treatment and disposal procedures for hazardous substances. These ARARs generally set performance, design, or other similar action-specific controls or restrictions on particular kinds of activities. An example might be a state Air Quality Management Authority that sets limitations on fugitive dust generated during grading and excavation activities during remedial actions.

To Be Considered Requirements (TBCs) and Policies

To Be Considered Requirements (TBCs) and other policies, the final class of requirements considered by EPA during the development of ARARs, are non-promulgated advisories, policies, or guidance documents issued by federal or state governments. They do not have the status of ARARs, and are not legally binding, but may be considered in determining the necessary cleanup levels or actions to protect human health and the environment.

2.2.2.2 Definition of ARARs

“Applicable” requirements are defined as those cleanup or control standards, or other substantive environmental protection requirements, criteria, or limitations, promulgated under federal or state laws. Applicable requirements are identified on a site-specific basis by determination of whether the jurisdictional prerequisite of a requirement fully addresses the circumstances at the site or the proposed remedial activity. All pertinent jurisdictional prerequisites must be met for the requirement to be applicable. These jurisdictional prerequisites are as follows:

- The party must be subject to the law;
- The substances or activities must fall under the authority of the law;
- The law must be in effect at the time the activities occur;
- The statute or regulation requires, limits, or protects the types of activities; and
- A requirement is applicable if the specific terms (or jurisdictional prerequisites) of the statute or regulation directly addresses the circumstances at the site.

“Relevant and appropriate” requirements refer to those cleanup standards, or other substantive environmental protection requirements, criteria, or limitations promulgated under federal or state law, that while not necessarily applicable, address problems or situations sufficiently similar to those encountered at the CERCLA site, and whose use is well suited to the particular site (*EPA, 1993*). The relevance and appropriateness of a requirement can be judged by comparing a number of factors including the characteristics of the remedial action, the items in question, or the physical circumstances of the site, with those addressed in the requirement. If there is sufficient similarity between the requirements and the circumstances at the site, determination of the requirement as relevant and appropriate may be made.

Determining whether a requirement is both relevant and appropriate is a two-step process. First, to determine relevance, a comparison is made between the response action, location, or chemicals covered by the requirement and related conditions at the site, release, or potential remedy. A requirement is relevant if it generally pertains to these conditions. Second, to determine whether the requirement is appropriate, the comparison is further refined by focusing on the nature of the items, the characteristics of the site, the circumstances of the release, and the proposed response action. The requirement is appropriate if, based on such comparison, its use is well suited to the particular site. The facility must comply with the substantive elements of requirements that are determined to be both relevant and appropriate.

2.2.2.3 Application of ARARs at Former Fort Ord

CERCLA Section 121(d) allows the selection of alternatives that will not attain ARAR status if any of six conditions for a waiver of ARARs exists. However, the selected alternative must be protective even if an ARAR is waived. Only five of the conditions for a waiver may apply to a Department of Defense (DoD) site. The conditions for a waiver are as follows:

- The action selected is only part of a total response action that will attain the required level or standard of control when completed;

- Compliance with the designated requirement at that site will result in greater risk to human health and the environment (e.g., worker safety) than alternative options;
- Compliance with the designated requirement is technically impracticable from an engineering perspective;
- The action selected will result in a standard of performance that is equivalent to an applicable requirement through the use of another method or approach;
- A state requirement has not been equitably applied in similar circumstances on other remedial actions within the state; and
- A fund-financed remedial action does not provide a balance between available monies and the need for protection of human health and the environment at sites where the need is more immediate (not applicable to DoD sites).

In addition to ARARs being classified into three broad categories (i.e., chemical-specific, location-specific, and action-specific), each ARAR is also noted by the action that may be taken at the former Fort Ord in the process of implementing the potential remedial alternatives. Thus, during remediation of an area ARARs may pertain to activities that involve site preparation such as clearance of vegetation, grubbing, grading; and/or excavation or other intrusive activities. In many cases, an ARAR will pertain to more than one type of action stated above.

In determining whether a requirement is pertinent to MEC at the former Fort Ord, potential ARARs are initially screened for applicability. If determined not to be applicable, the requirement is then reviewed for both relevance and appropriateness. Requirements that are considered to be relevant and appropriate command the same importance as applicable requirements.

2.2.2.4 Land Use Control Guidelines

The following guidelines set forth by the EPA, DoD, and DTSC (a part of California Environmental Protection Agency (Cal/EPA)) that are relevant to potential Land Use Controls that may be selected for the Impact Area MRA will be considered in the development and implementation of remedial alternatives.

As described in the *Management Principles for Implementing Response Actions at Closed, Transferring, and Transferred Ranges* (EPA/DoD, 2000):

- Land use controls must be clearly defined, established in conjunction with affected parties, and enforceable.
- Land use controls will be considered as part of the development and evaluation of alternatives for a given Closed, Transferring, or Transferred (CTT) range.
- DoD (the Army) will conduct periodic reviews to ensure the long-term effectiveness of response actions, including Land Use Controls.

In addition, EPA/DoD guidelines specifically address the requirement for institutional controls (Land Use Controls) when MEC contamination has been or may still be on the site as follows:

“Property transfer records shall detail past munitions and explosive contamination and decontamination efforts; provide requisite residual contamination information; and advise the user not to excavate or drill in a residual contamination area without a metal detection survey.”

The EPA policy *Institutional Controls and Transfer of Real Property under CERCLA Section 120 (h)(3)(A), (B), or (C) (EPA, 2000a)* requires the responsible agency to perform the following activities:

- "Monitor the institutional controls' effectiveness and integrity.
- Report the results of such monitoring, including notice of violation or failure of control to the appropriate EPA and/or State regulator, local or Tribal government, and designated party or entity responsible for enforcement.
- Enforce the institutional controls should a violation or failure of controls occur."

In addition, the policy states that “In order to ensure long-term protection of human health and safety in the presence of potential explosive hazards, institutional controls must be enforceable against whomever may gain ownership or control of the property in the future.”

In 1987, DTSC developed policy recommending the use of Land Use Covenants based on statutory authority in the California Health and Safety Code (Chapters 6.5, 6.8 and 6.85) and the California Civil Code, Section 1471, which allows an owner of property to enter into environmental restrictions due to the presence of hazardous materials, hazardous wastes or constituents, or hazardous substances that will remain at the property at levels which are not suitable for unrestricted use of the land. In April 2003, DTSC adopted regulations to add Section 67391.1—Requirements for Land Use Covenants—to Title 22, Division 4.5, Chapter 39, of the California Code of Regulations.

These regulations specify that a Land Use Covenant imposing appropriate limitations on land use shall be executed and recorded at a county recorder's office so that they will be found during a title search of county records. The Land Use Covenant regulations require DTSC to clearly set forth and define land use limitations or covenants in a remedy selection or response action decision document prior to approving or concurring with a response action, and that the decision document must also include an implementation and enforcement plan.

Land Use Covenants are proprietary controls, agreed to by property owners, to allow ongoing use of the property as long as the cleanup remedy is not compromised by current or future development. Land Use Covenants include written instruments and agreements restricting land uses, easements, servitudes, covenants and land use restrictions, i.e., they are non-engineering mechanisms to restrict activities and site access to limit exposure pathways of human and environmental receptors to prevent exposure to contaminants. Land Use Covenants “run with the land”, i.e., they are binding on current and subsequent property owners, and remain in effect until they are formally removed or modified, pursuant to the California Health and Safety Code, sections 25233, 25234, and 25398.7. These regulations certify that DTSC may later modify or terminate Land Use Covenants if it is determined such modification or termination is protective of public health and safety and the environment.

For sites requiring Land Use Covenants, DTSC policy and Title 22, Division 4.5, Chapter 39, Section 67391.1 require that the property owner enter into a Land Use Covenant Agreement to ensure that the state will have authority to implement, monitor, and enforce protective restrictions. Restrictions agreed to in Land Use Covenants are typically intended to do the following:

- Prevent inappropriate land use on property containing residual contamination or the surrounding property;
- Guarantee that information about property containing residual contamination is available to local governments and the public;
- Disclose to real estate transactions participants (buyers, sellers, lending institutions, brokers, title companies) that the property in question contains residual contamination;
- Ensure that long-term mitigation measures or monitoring requirements are carried out and maintained;
- Ensure that the integrity and stability of the remedy is maintained;
- Ensure that subsequent property owners or lessees have a duty to assume responsibility for any requirements or restrictions pertaining to residual contamination when they take over the property;
- Ensure that DTSC will be contacted prior to change in land use or the cleanup remedy; and
- Ensure that only DTSC can terminate or modify the remedy (land use covenant per DTSC policy).

However, because the Impact Area MRA is a federal property owned by the Army, land use controls will be specified in the property transfer document or letter of transfer—a vehicle similar to the deed of property. The Army intends that this will comply with Title 22, Division 4.5, Chapter 39, Section 67391.1(e)(2), and will assure that a mechanism is in place to ensure that future land use will be compatible with the MEC risks my remain after MEC remediation. In addition, because the property will remain in the control of a federal agency, the land use covenant described in Title 22, Division 4.5, Chapter 39, Section 67391.1(h) does not apply that states that responsible parties, facility owners or operators, or project proponents involved in land use covenants to pay all costs associated with the administration of such controls.

2.3 Ongoing and Future MEC-Related Activities

This section describes ongoing and future MEC-related activities at the former Fort Ord that are components of the Army's basewide efforts to promote MEC safety because of Fort Ord's history as a military base. The Army's *Munitions Response Site Security Program* (Army, 2005) describes many of these efforts. Section 4.1 describes the Long Term Management Measures that are specific to implementation and management of the remedial alternatives selected for the Impact Area MRA.

Five-Year Review

A review of the basewide MR RI/FS sites will be conducted within 5 years after implementation of the selected remedy(s) in accordance with CERCLA. The purpose of the five-year review is to determine whether the remedy at a site continues to be protective of human health and the environment after a period of 5 years from the time the remedy was implemented (or from the time of a previous five-year review). The methods, findings, and conclusions of the five-year review are documented in a Five-Year Review report. In addition, the Five-Year Review report documents provide newly identified site-related data or issues that are identified during the review, and the report identifies recommendations to address them as appropriate. The second basewide Five-Year Review for the former Fort Ord will be conducted in 2007, and the next review in 2012.

Deed Notice

A notice on the deed or property transfer document will be included when transferring any former Fort Ord property and will identify pertinent site conditions related to military munitions use, munitions responses implemented, potentially remaining MEC risks if any, and any potential risk mitigation requirements.

MEC Incident Reporting

There is a potential for MEC to be present on the former Fort Ord because military munitions were used throughout its history. In the event MEC is discovered by a future user of former Fort Ord land, a process has been developed for reporting such finds to an appropriate local law enforcement agency. The local law enforcement agency will arrange a response by Unexploded Ordnance (UXO)-Qualified Personnel, who will promptly be dispatched to dispose of any discovered MEC. This process is documented and must be acknowledged by the future grantee, its successors or assigns. A “Safety Alert” pamphlet and incident reporting instructions are provided to property users.

MEC Recognition and Safety Training

The Army offers “MEC recognition and safety training” to anyone conducting ground disturbance activities (e.g., digging holes, excavating trenches, repairing underground utilities, etc.) at the former Fort Ord. The training is a 30-minute session conducted by the Army or the Army’s representative, and includes a lecture on what type of MEC might be found and the procedures to follow if something is found. The “Safety Alert” brochure is also distributed. Trained construction personnel will contact an appropriate local law enforcement agency if a potential military munitions item is encountered. The local law enforcement agency will then arrange a response by UXO-Qualified Personnel. The following are some of the organizations that have received MEC recognition and safety training: California State University Monterey Bay (CSUMB), U.S. Army Corps of Engineers (USACE) contractors, Pacific Gas & Electric, Pacific Bell, and the Bureau of Land Management. MEC recognition and safety training can be scheduled by contacting the Fort Ord Base Realignment and Closure (BRAC) office at (831) 242-7919.

School Education

Since 1997, the former Fort Ord has had a MEC Safety Education Program that is offered to local schools annually. The objective of this program is to provide school-age children with the ability to recognize the visible attributes of various MEC items likely to exist on the former Fort Ord, associate danger with MEC items and former Fort Ord MEC areas, and understand the actions to be taken when a possible item is observed. This program has a three-tiered approach that includes (1) distribution of the “Safety Alert” to organizations and agencies who provide information to the local community; (2) a 1-hour MEC safety presentation for local elementary and middle schools for 5th, 6th, and 7th grade students; and (3) distribution of the “Safety Alert” to parents of children in the local schools, as well as inclusion in related subject presentations (environmental and earth sciences) to high school students. Representatives from the Army conduct the MEC safety presentation.

Community Involvement

The Army is committed to develop opportunities to assist community members in understanding and participating in the cleanup decision-making process at the former Fort Ord. The Army holds public meetings, Community Involvement Workshops, Technical Review Committee (TRC) meetings, and open houses and conducts public information sessions through booths or tables at local community events. The

Army provides public and media tours of former Fort Ord cleanup activities, distributes fact sheets, and makes presentations to special interest and community groups as necessary to address specific community concerns or explain significant cleanup activities. The Army also maintains document repositories available to the public including the administrative record and information repositories at local libraries. Additionally, the Army administers a public environmental cleanup web site (www.fortordcleanup.com), maintains a community relations mailing list, mails monthly cleanup updates, and regularly assesses community interest and information source preferences. The web site provides background information, a description of current activities, documents available for public comment, maps, notices, and agendas for upcoming public meetings. The monthly cleanup update includes information on recent cleanup activities, recently published documents and fact sheets, and is mailed to those who have requested to be on the community relations mailing list and distributed at community involvement events. Community involvement activities are documented in the Fort Ord Community Relations Plan that is updated annually. The Fort Ord cleanup outreach program continues to look for ways to increase accessibility, provide opportunities for the public to learn about the cleanup and provide a variety of ways for the public to participate. Various outreach events and community participation (attendance) are included in the Community Involvement Record in the Fort Ord Community Relations Plan. In addition, the Fort Ord newsletters are regularly distributed to businesses and residences in the surrounding Fort Ord communities including churches, schools, restaurants, and grocery stores.

Local Ordinances

Some local jurisdictions have established ordinances to monitor or control intrusive activities in specified areas of the former Fort Ord to manage risks of encountering potential MEC related to potential and planned development. These ordinances are not relevant within the Impact Area MRA where the land remains within federal control.

3.0 IDENTIFICATION OF APPLICABLE RESPONSE ACTIONS

This section describes the applicable response actions that could mitigate and manage potentially remaining MEC risks at the Impact Area MRA, including:

- No Further Action—Is a baseline for comparison and does not assume a protective and ARAR-compliant state for the designated reuse.
- Land Use Controls—Assumes the MEC risks at the reuse area can be managed through implementation of controls on the designated reuse.
- MEC Remediation—Assumes the MEC risks at the reuse area cannot be adequately managed through implementation of controls on the designated reuse; therefore, MEC remediation should be implemented.

The individual components of the response actions described herein will be developed into remedial alternatives as described in Section 4.0.

3.1 No Further Action

The No Further Action Alternative is provided, as required under CERCLA and the National Contingency Plan (NCP), as a baseline for comparison to the other proposed remedial alternatives. This alternative assumes no further action would be taken related to MEC at the Impact Area MRA.

3.2 Land Use Controls

The Land Use Controls that are potentially applicable for the Impact Area MRA are described in the following sections. If selected as part of the remedy for the Impact Area MRA, these Land Use Controls will be implemented in accordance with the guidelines presented in Section 2.2.2.4 (Land Use Control Guidelines), and will be described in further detail in the Land Use Control Implementation Remedial Design/Remedial Action Work Plan (LUCI RD/RAWP). Under the Federal Facility Agreement (FFA) between the Army, EPA, and DTSC, a schedule for preparation of the LUCI RD/RAWP for the Impact Area MRA will be submitted within 21 days of signature of the ROD. Land use controls will be recorded at a county recorder's office.

The following Land Use Controls that will be considered for the Impact Area MRA are described below:

- Property Transfer Documentation;
- MEC Recognition and Safety Training;
- Construction Monitoring/UXO-Qualified Personnel Support; and
- Access Management Measures.

3.2.1 Property Transfer Documentation

Restrictions or conditions on the property specified in property transfer documentation may be appropriate if placing controls on, or limits to, property use would prevent or limit exposure to potentially remaining MEC risks at the Impact Area MRA during reuse. Specific types of restrictions would vary depending on the conditions, potential MEC risks, and anticipated future land use. The Army will follow appropriate federal property management regulations. The property transfer document would identify who would be responsible for implementation, monitoring, reporting, and enforcement. If selected for implementation at the Impact Area MRA, the restrictions identified in the ROD would be described in further detail in the LUCI RD/RAWP.

Property transfer document restrictions regarding potential MEC risks at the Impact Area MRA would establish the appropriate restriction that indicates:

- Specified reuses evaluated in the RA that were designated and approved at the time the Army transfers the property must be maintained by all property owners. Unrestricted land use, typically represented by a residential exposure scenario by the regulatory agencies, would be prohibited.
- Potential MEC risks may significantly increase if changes in the designated and approved reuse are implemented.
- Any modifications to these restrictions must be approved by the project team (the Army, EPA, and DTSC; a part of Cal/EPA) prior to implementation.

At the time of the five-year review, the Army or Army's representatives, in consultation with the property users and regulatory agencies, would assess whether the restrictions continue to be protective or require modifications.

3.2.2 MEC Recognition and Safety Training

For the Impact Area MRA, some digging or underground "intrusive" activities are planned for the proposed reuses. Personnel involved in conducting reuse activities at the Impact Area MRA would be required to attend the "MEC recognition and safety training" to increase their awareness of and ability to identify MEC items. Prior to planned intrusive activities, the landowner would be required to notify the Army or Army's representatives and arrange for MEC recognition and safety training to be provided to all workers performing intrusive activities. If selected for implementation at the Impact Area MRA, this training would be described in further detail in the LUCI RD/RAWP. At the time of each five-year review, the Army or Army's representatives would assess the status of the training program and document any recommendations or modifications to the program as described in the LUCI RD/RAWP.

3.2.3 Construction Monitoring/UXO-Qualified Personnel Support

Construction monitoring would be performed by UXO-Qualified Personnel during any intrusive or ground-disturbing construction activities at the Impact Area MRA to address potential MEC risks to construction personnel. Construction monitoring would be arranged during the construction planning stages of the project prior to the start of any intrusive activities. For the purposes of this FS, it is assumed that two UXO-Qualified Personnel would be available to provide the UXO support. UXO-Qualified Personnel would monitor construction activities for the potential presence of MEC during any intrusive activities. If evidence of MEC is found during intrusive construction activities, the work would cease; a process has been developed for reporting such finds to an appropriate local law enforcement agency. The

local law enforcement agency would promptly dispatch or arrange a response by UXO-Qualified Personnel (e.g., an Explosive Ordnance Disposal [EOD] unit).

For the purposes of this FS, it is assumed that the two UXO-Qualified Personnel would be available on a full time basis to provide other UXO support as necessary, in addition to construction monitoring, during reuse of the Impact Area MRA.

Any MEC-related data that may be discovered during construction monitoring would be reported by the Army under the annual monitoring program, and the monitoring results would be presented in a five-year review report. If selected for implementation at the Impact Area MRA, the level of effort involved in conducting construction monitoring would be determined on a case-by-case basis depending on site conditions, and would be described in further detail in the LUCI RD/RAWP.

As part of annual monitoring and five-year review reporting, after the reuse is established, a review of any MEC-related data collected would be performed and documented for assessment by the project team (the Army, EPA, and DTSC; a part of Cal/EPA) to determine the status of the construction monitoring program based on the established reuse for each area. At the time of each five-year review, the Army or Army's representatives would assess the status of the construction monitoring program and document any recommendations or modifications to the program as described in the LUCI RD/RAWP.

3.2.4 Access Management Measures

Access management measures could include (1) maintenance of existing measures at the Impact Area MRA, or (2) implementation of additional measures. The *Munitions Response Site Security Program* and yearly updates (Army, 2005) provide information about different types of site security measures that are or will be implemented and maintained at the former Fort Ord. Site security will continue as an Army function until the property is transferred. The site security program is updated as necessary to reflect any additional security measures that may be needed in the future to ensure the safety of nearby populations. The site security program will be modified as necessary due to changes in the nearby human populations. If selected as part of a remedy, such site security measures will continue to be implemented after property transfer until the measures are no longer needed.

For the Impact Area MRA, the following access management measures may be applicable:

- **Fencing and Signs** would be selected and constructed and/or existing fencing would be maintained based on reuse and the potential for MEC risks. For the purposes of this FS, it is assumed that existing fencing surrounding the Impact Area MRA (4-strand barbed wire fence w/concertina wire in some portions) and signs would be maintained, and vegetation would be mowed along the fence line. Temporary fencing may be constructed and maintained as necessary for public safety for the duration of the MEC removal around the perimeter of each of the areas where MEC remedial actions would be conducted each year using the phased approach described in Section 3.3.1. The design of the perimeter fence may be modified based on site-specific considerations.
- **Law Enforcement Security Patrols** would be employed by either private or governmental entities to maintain and control access restrictions, and monitor and discourage trespassing into areas potentially containing MEC risks. For the purposes of this FS, it is assumed one-third of a full time-equivalent of a law enforcement ranger would be employed during reuse of the Impact Area MRA.
- **Fire Suppression Helicopter Support** would be provided as necessary for select future HMP/HCP prescribed burns where subsurface MEC risks cannot be otherwise mitigated. MEC remaining in the

subsurface may pose a risk to fire-fighters trying to suppress spot fires in some cases. For the purposes of this FS, it is assumed a helicopter would be provided onsite during select prescribed burns to extinguish spot fires that may occur during prescribed burns in areas where subsurface MEC risk cannot be mitigated by other methods through planning.

If selected for implementation at the Impact Area MRA, these measures would be described in further detail in the LUCI RD/RAWP. At the time of each five-year review, the Army or Army's representatives would assess the status of the measures and document any recommendations or modifications to the program as described in the LUCI RD/RAWP.

3.3 MEC Remediation

MEC Remediation includes the following components:

- **Vegetation Clearance** involves conducting site preparation procedures to clear vegetation to allow for MEC investigation and removal, and to provide the required ground surface visibility for the safety of MEC workers.
- **MEC Remedial Action** involves using the best appropriate practices and/or technologies available for MEC detection and removal (remediation), and MEC detonation using Department of Defense Explosives Safety Board (DDESB)-approved MEC procedures in areas where explosives MEC items are identified during remedial activities and require disposal.

Descriptions and applicable methods for implementation of MEC remediation are described below. If selected for implementation at the Impact Area MRA, a site-specific work plan outlining planned (1) vegetation clearance methods (prescribed burning), (2) MEC removal methodologies, and (3) habitat monitoring protocols would be available for regulatory agency and public review.

3.3.1 Vegetation Clearance Via Prescribed Burning

The Impact Area MRA is densely vegetated; therefore, in order to provide safe access for workers to conduct MEC removals, vegetation clearance is required as a first step. The *Installation-Wide Multispecies Habitat Management Plan for Former Fort Ord, California* (HMP; USACE, 1997) presented the boundaries of habitat reserve areas and describes land use, conservation, management, and habitat monitoring requirements for target species within the Impact Area MRA, and was prepared in accordance with the U.S. Fish and Wildlife Service (USFWS) Biological Opinions (USFWS, 1997a, b). Changes to requirements of the HMP have also been documented since it was published, including additional Biological Opinions (USFWS, 1999, 2002, 2005), a Memorandum of Understanding (BLM, Army, 2004), an Assessment (Zander, 2002), and a *Revised Attachment A Habitat Management Plan Map* (USACE, 2005), and additional requirements anticipated during reuse (Zander, 2007). The HMP and these additional requirements establish the guidelines for the conservation and management of wildlife and plant species and habitats that largely depend on former Fort Ord land for survival.

These requirements were considered in the evaluation of vegetation clearance alternatives that are described and evaluated in the *Evaluation of Vegetation Clearance Methods Technical Memorandum, Ordnance and Explosives Remedial Investigation/Feasibility Study, Former Fort Ord, California* (Vegetation Clearance Technical Memorandum; Harding ESE, 2002). Table 12 of the Vegetation Clearance Technical Memorandum presents a matrix of vegetation clearance methods that should be retained for further consideration for the range of different plant communities (or types of vegetation) found at the former Fort Ord.

The selection of vegetation clearance methods depends on (1) the type and density of vegetation and MEC present, and (2) the planned reuse of the site. Methods of vegetation clearance for different plant communities at the former Fort Ord were evaluated for the Impact Area MRA. The Impact Area MRA is designated habitat reserve, and is primarily covered by Central Maritime Chaparral (CMC). The Vegetation Clearance Technical Memorandum evaluated several vegetation clearance methods that may be applicable in CMC and Coastal Scrub communities, and identified prescribed burning as the only method readily available for use in CMC and Coastal Scrub communities. Other vegetation clearance methods were evaluated, but their use is allowable on a limited basis only, or further study is required. “Crush and burn” methods may be applicable, but would require further study. Manual and mechanical cutting are applicable for up to 50 acres of unburned CMC in polygons located in habitat reserve areas; widespread use of cutting in habitat reserve containing CMC is unacceptable because it has not been shown to support successful recovery of the rare habitat. These methods will be retained for further consideration on a limited basis depending on area-specific conditions identified in the work plan for each area. Prescribed burning has been demonstrated to achieve the vegetation clearance goal of removing the vegetation to successfully facilitate follow-on MEC removal in compliance with the HMP.

The Army has also considered the potential implementation of mechanical vegetation clearance followed by MEC removal, and then prescribed burning, in order to be able to implement MEC removals without first conducting a prescribed burn. Dense vegetation with potentially high densities of high explosive MEC on the ground surface may make it difficult for the mechanical clearance equipment to safely access the area and to cut the vegetation. In addition, there is insufficient data at this time to determine whether this methodology could be implemented successfully and in compliance with HMP requirements and ARARs. It has not been shown that recovery of CMC habitat and sensitive species would be successful after implementing this methodology. Therefore, this potential option is not considered further at this time for the purposes of this FS.

For the purposes of this FS and costing remedial alternatives, in accordance with the HMP that specifies requirements for implementation of prescribed burning in habitat reserve areas, it is assumed:

- Prescribed burns would be conducted in stages and consist of several small burns, approximately 100 acres in size (actual size could be more or less than 100 acres depending on site-specific characteristics) over several days rather than one large burn. A site-specific work plan will be prepared prior to each phase of work, including a burn plan. This burn plan will describe the locations and widths of temporary and permanent fuel breaks, and the number and size of burns that are planned for the year.
- Each contiguous prescribed burned area would not exceed 400 acres (separated by a minimum of 25 acres to allow a mosaic pattern consisting of difference age classes of vegetation) as specified under the HMP, unless specifically coordinated with USFWS; under the HMP, no more than 800 acres would be allowed to be prescribed burned in any given year.
- Prescribed burning (followed by MEC remedial action) would be implemented not to exceed 800 acres of the 6,560-acre Impact Area MRA per year.
- Manual and/or mechanical cutting of unburned vegetation may be conducted as necessary, but would not exceed 50 acres in each polygon, unless specifically coordinated with USFWS.
- Manual and/or mechanical cutting of burned vegetation may be conducted.

The following section describes the general procedures for prescribed burning as it would be implemented within the Impact Area MRA.

3.3.1.1 Description of Prescribed Burning for Impact Area MRA

The major elements of conducting prescribed burning within the Impact Area MRA for the purposes of vegetation clearance prior to MEC remedial actions are described below according to the parameters of discussion described in the Vegetation Clearance Technical Memorandum (*Harding ESE, 2002*).

How the Method is Carried Out in the Field

The major elements of prescribed burning include:

- Preparation of a burn prescription/burn plan outlining the objectives of the burn, burn area, and the range of environmental conditions under which the burn will be conducted; workforce and equipment resources required to ignite, manage and contain the fire; and communication procedures;
- Site preparation, including establishment and maintenance of containment lines;
- Conducting the burn within the range of environmental conditions established in the burn prescription; and
- Follow-up operations to ensure that the fire is fully contained.

Based on past experience and habitat conservation considerations, it is anticipated that prescribed burns would be conducted in stages and consist of several small burns, approximately 100 acres in size (actual size could be more or less than 100 acres depending on site-specific considerations) over several days rather than one large burn. Each contiguous prescribed burn area would not exceed 400 acres (separated by a minimum of 25 acres to allow a mosaic pattern consisting of different age classes of vegetation) unless specifically coordinated with USFWS; under the HMP, no more than 800 acres would be allowed to be prescribed burned in any given year.

Regularly-maintained roads and fuelbreaks that are accessible by vehicles and fire management equipment currently divide the site into several sections (300 to 500 acres in size). These sections would be further divided by utilizing established roads and trails to the extent possible that can be expanded as temporary fuel breaks (instead of creating brand new fuel breaks through thick vegetation that would involve higher level of effort and potential avoidable habitat impacts). The sizes of the burn areas are contingent on many factors, the most important being the location and condition of major fuelbreaks (well maintained, substantial fuel breaks where a fire could be held from spreading past that location). Other factors considered are topography, slope aspect, fuel type, fuel loading, fire behavior, and the proximity of urban/wildfire interface. The actual size and configuration of burn areas would be determined by the Army fire department in charge. The fire department would determine these parameters to minimize the size and duration of each burn, to best maintain control of the burn, to minimize smoke impacts, to be able to execute the burn within the narrow meteorological window, minding also explosives safety and other technical and practical considerations. The fire department would select areas to strategically create a buffer between the Impact Area MRA and the surrounding communities to protect the communities from any potential wildfire or fire hazard. Proposed burn areas, containment lines, and supporting rationale would be described in site-specific implementation work plans (anticipated to be prepared for each year of planned cleanup work) that would be submitted for DTSC review and EPA concurrence.

Potential Impacts to the Public

It is anticipated that the prescribed burns will be conducted in stages and consist of several small burns (approximately 100-acre units over several days) rather than one large burn. Each contiguous prescribed burned area will not exceed 400 acres (separated by a minimum of 25 acres to allow a mosaic pattern consisting of difference age classes of vegetation) as specified under the HMP, unless specifically coordinated with USFWS; under the HMP, no more than 800 acres would be allowed to be prescribed burned in any given year. A site-specific work plan will be prepared prior to each phase of work. The implementation plan will include a burn plan. This burn plan will describe the locations and widths of temporary and permanent fuel breaks, and the number and size of burns that are planned for the year. Each burn plan would outline a range of environmental conditions under which the burn will be conducted, developed with the goals of conducting a fully contained burn and minimizing smoke impacts to the community.

The Army will provide public notification of planned prescribed burns. A prescribed burn will be started only when optimum burn conditions are confirmed. Mobilization of fire management personnel and equipment, and public notification, will occur when optimum burn conditions are reasonably expected. Once mobilized, fire and management personnel, equipment, and supplies may be in place and standing by for several days. Because the Army will be waiting for appropriate atmospheric conditions rather than trying to anticipate them, the Army will not know conclusively until moments before the fire is lit that the burn will occur that particular day. In addition, multiple burn events may be conducted over a period of several days that could be interrupted by one or more days of no burning. Through community notification, the public will be advised of reasonable precautions they can take to minimize exposure to smoke from prescribed burns, such as staying indoors with doors and windows closed, and limiting outdoor activity when smoke is present.

The Army will notify the community before the day of burning, and the notification will continue until the end of the prescribed burn. Notification could include several avenues of communication such as posters/flyers, telephone calls and announcements in local newspapers, telephone hotline and websites. The audience and manner of public notification will be specified in the prescribed burn plan.

Prescribed burns may cause some smoke impacts under most meteorological conditions; however, development of the burn prescription would include assessment of meteorological conditions and design of the prescription to minimize potential impacts to the public. Prior public notification and smoke management while conducting the burn would minimize potential impacts from smoke.

Health impacts from short-term exposure to smoke from prescribed burns are temporary based on the results of air monitoring conducted during the prescribed burn in 2003, and an independent analysis of the results conducted by Agency for Toxic Substances and Disease Registry (ATSDR). The Army and regulatory agencies believe these health risks need to be balanced with health and safety risks to MEC removal workers. Conducting a prescribed burn within the Impact Area MRA is not expected to have significant adverse impacts on the public. The prescribed burn would be conducted under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries.

An assessment of MEC-related air emissions that may be associated with a burn was conducted in the *Technical Memorandum, Air Emissions from Incidental Ordnance Detonation During a Prescribed Burn on Ranges 43 through 48, Former Fort Ord, California* (Air Emissions Tech Memo; Harding ESE, 2001), which indicated air pollutant emissions from incidental MEC detonation during a prescribed burn in Ranges 43 through 48 within the Impact Area MRA would be minor compared to emissions

contributed directly by biomass burning, and would result in pollutant concentrations well below health-protective regulatory screening levels.

The Army conducted extensive air monitoring during the Ranges 43-48 prescribed burn in October 2003 (*Harding ESE, 2004*). The prescribed burn jumped the containment lines and burned nearly 1,500 acres (including the 500-acre Ranges 43-48 site). Air monitoring samples were collected at fourteen (14) locations at and surrounding the Ranges 43-48 site. Based on the analysis of the air monitoring results, munitions-related chemicals (i.e., explosive residues) were not detected in air samples. In addition, the ATSDR conducted an independent evaluation of the air monitoring results, and concluded emissions from the burn posed “no apparent public health hazard” (*ATSDR, 2005*).

Community notification and smoke management would minimize potential impacts from smoke. The short duration and repetitive nature of these burn events may produce a significant time and travel burden on those attempting to relocate, return, and then relocate several times within days or weeks. For these reasons, the Army has determined it is not possible to implement an effective temporary voluntary relocation program for the community during prescribed burns in the Impact Area MRA. Through community notification, the public will be advised of reasonable precautions they can take to minimize exposure to smoke from prescribed burns, such as staying indoors with doors and windows closed, and limiting outdoor activity when smoke is present.

The possibility of incidental MEC detonation exists for any vegetation clearance method. Mitigation of potential public exposure to flying fragments or blast debris from accidental detonation of UXO during vegetation clearance activities would be prevented by: (1) conducting a pre-field analysis of the type, size, and orientation of the UXO known or expected to be present in a given area and its proximity to the public, (2) calculation of the maximum distance flying fragments or blast debris would travel based on the type and size of UXO, and (3) implementation of mitigation measures if necessary to prevent public exposure. Potential emissions from detonated UXO are expected to be insignificant and not of concern in terms of human health.

Worker Safety

Burning of vegetation would be conducted using aerial methods (e.g., via helicopter), which would isolate workers from direct exposure to UXO that is potentially present in areas being cleared. Although some ground crews would be present in fuel break areas, and air sampling or meteorological stations may be placed and maintained near the prescribed burn area, development and implementation of a health and safety plan for workers would mitigate worker exposure to injury. The health and safety plan will identify appropriate separation distances for workers.

In the case of accidental detonation of UXO, prescribed burn workers would not be likely to be exposed to flying fragments or blast debris depending on distance to and the type and size of the UXO. In general, the possibility of incidental MEC detonation exists for any vegetation clearance method. The burn would be conducted by personnel located outside the burn area containing UXO, which would minimize exposure.

Duration of the Vegetation Clearance Method

For a typical prescribed burn within the Impact Area MRA, vegetation clearance using prescribed burning would include preparing for and conducting the burn, conducting air monitoring and follow-up monitoring for fire safety. To minimize the size and duration of burn events, multiple events may be conducted over a period of several days that includes one or more days when no burning will be

conducted. The Army anticipates that during each mobilization, a contiguous area of up to 400 acres would be burned. Planned prescribed burns will not exceed 800 acres per year.

Erosion

Vegetation clearance using prescribed burning may result in some surface disturbance or erosion on slopes in the short term, since fire reduces most of the vegetation to bare mineral soil. However, revegetation of burned areas is likely to proceed rapidly following the start of the next rain season, thus minimizing further erosion potential. In the long term, burning would have a beneficial impact on the health and growth of the plants and their stability.

Impacts to Protected and Other Natural Resources

Burning would have beneficial impacts on rare, threatened and endangered species because chaparral communities have evolved to be dependent on fire for its health and functioning. Research indicates chaparral vegetation cleared by burning not only recovers, but also flourishes and provides an opportunity for a greater diversity of native plants to grow. Plants and animals in the Impact Area MRA have survived, become dependent on, and adapted to a cycle of occasional fire that recycles nutrients and exposes minerals in the soil while stimulating the germination of seeds that accumulate in between fires. This natural succession allows the plant community to rejuvenate itself and enhances the natural diversity of the unique habitat containing rare, threatened and endangered plants at the Impact Area MRA. Based on observations made during monitoring of habitat recovery after vegetation clearance at Fort Ord (conducted under the HMP monitoring program) burning is supported as the primary method for vegetation clearance for the following reasons:

- Seedlings of HMP shrubs were common in burned areas after clearance activities. An evaluation indicated HMP shrub regeneration occurred in densities over 3,000 seedlings per acre after burning (as compared to only 29 seedlings per acre occurred after cutting).
- Species diversity is generally higher in burned areas.
- More native herbaceous species were observed in burned areas.

In addition, because the chaparral habitat contains protected species at the Impact Area MRA, resource management measures are required by the USFWS as detailed in Biological and Conference Opinion (BO), memoranda, and other correspondence between USFWS and the Army (USFWS, 1999, 2001, 2002, 2005; Army, 1998, 2000) and in accordance with the HMP (USACE, 1997). The intent of the USFWS is that “the Army would primarily use prescribed fire to clear vegetation in support of Ordnance and Explosives (OE) removal actions in areas designated as habitat reserves [and] . . . to preserve, protect, and enhance populations and habitat of listed species and to protect candidate and sensitive species to the extent needed to preclude the need for future listings.” Consequently, methods of vegetation clearance in CMC that do not involve burning are not consistent with the habitat and species preservation and protection goals of the HMP (USFWS, 2001).

Use at Fort Ord or Other Sites and Under What Conditions

Prescribed burning has been used extensively at former Fort Ord for decades because of military training activities, and has also been used to clear vegetation from munitions response sites/areas (MRSs/MRAs) similar to and within the Impact Area MRA to support removal actions at the former Fort Ord since 1994. Prescribed burns are conducted in close coordination with federal, state, and local regulatory agencies.

Prescribed burns consist of using fire under optimal climatic conditions to clear vegetation from MRSs/MRAs, and are the primary vegetation clearance method for CMC habitat that exists within the Impact Area MRA.

It is anticipated that temporary fuel breaks will be cut and surface cleared around each burn unit prior to burning. In addition, safety set back distances will be identified that will protect the public during vegetation clearance activities. The details of these measures will be documented in the site-specific implementation work plan.

There is a risk of escaped fires or wildfires involved in burning vegetation. Of nine prescribed burns conducted at the former Fort Ord since 1994, two prescribed burns (1997 and 2003) escaped and became wildfires. However, the majority of prescribed burns were successfully conducted without becoming a wildfire, and fire mitigation techniques and personnel are in place under the burn prescription to prevent and address such instances.

Availability of Equipment and Personnel

Prescribed burning has been used extensively at the former Fort Ord and the equipment and personnel necessary to implement burning would be available for use at the Impact Area MRA.

Deposition of Vegetation

Depending on the provisions of the burn prescription and the occurrence of suitable conditions, the burn would clear or consume the majority of top growth on shrubs, consume the leaf litter, and burn a portion of the standing woody stems. The extent to which woody material would be consumed is directly related to fuel moisture and ambient conditions at the time of the burn. Under relatively cool, moist conditions, very little woody material would be consumed. Under low-humidity, low-fuel moisture conditions, woody vegetation up to 2 inches in diameter may burn.

Visibility of Ground Surface

Safety procedures require the vegetation be cleared to bare ground or approximately 6 inches above ground surface to allow for proper operation of MEC detection equipment and prevent the accidental detonation of UXO on the surface. This level of clearance would be achievable using burning. Fire clears the vegetation and leaves the range in a condition that typically provides MEC removal workers with a clear, unobstructed view of the ground surface. Manual and/or mechanical cutting of burned vegetation may be conducted if necessary to conduct munitions response actions (e.g., MEC removals).

Level of Effort in Terms of Personnel

Prior to the burn, Army personnel will ensure the public is informed of the planned burn through a notice in a local newspaper and/or other avenues of communication that would be described in the burn plan. In addition, vegetation clearance and UXO-Qualified Personnel would clear and maintain fuel breaks surrounding the burn area and form a containment line. An air monitoring program would be developed and implemented. Any air samples collected would be analyzed offsite. In addition, meteorological profiling would be conducted prior to and during the burn. Prescribed burning would be conducted using aerial methods (such as an operator to pilot a helicopter equipped with a torch to initiate the burn). Fire suppressant crews would stand by during the burn and emergency fire crews from local jurisdictions would be on notice in case the fire traveled in an unplanned direction. After the burn was completed the site will be monitored for fire safety until all operations are completed and fire crew is demobilized. Site-specific procedures would be detailed in prescribed burn plans.

3.3.2 MEC Remedial Action

After vegetation clearance is performed via prescribed burning as described in Section 3.3.1, MEC remedial action would be implemented in the burned area, and would include the following four components described below: (1) MEC Removal; (2) MEC Detonation; (3) Digital Mapping of Anomalies; and (4) Post-Remediation Habitat Monitoring. These remedial actions would be conducted in stages. A site-specific work plan would be developed for each phase of work outlining protocols for implementation of the first three components [(1) through (3)] and would be available for regulatory agency and public review.

3.3.2.1 MEC Removal

Based on the site characteristics and planned reuses of the Impact Area MRA described in the RI and RA (Volume I), MEC Removals at the Impact Area MRA would consist of identifying, investigating and removing MEC found under one of the following scenarios. Specific procedures would be described in the site-specific work plans that would be available for regulatory agency and public review:

- Technology-Aided Surface MEC Removal – Identify and remove MEC detected on the ground surface (with MEC detection instruments available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible).
- Subsurface MEC Removal – Identify, investigate, and remove MEC / Anomalies detected on the surface and in the subsurface to the depths found.

After vegetation clearance is performed via prescribed burning, UXO-Qualified Personnel would walk the site and conduct MEC removals. MEC and any other anomalies identified visually or using the detection equipment would be investigated, and if MEC was found, it would be detonated using DDESB-approved detonation procedures described in Section 3.3.2.2.

3.3.2.1.1 Technology-Aided Surface MEC Removal

This methodology would consist of a visual search of the ground surface and investigation and removal of any MEC. Munitions debris or range-related debris (anticipated to be 2-inches in diameter or larger; however, detailed specifications would be identified in the site-specific work plan) that is found on the ground surface may also be removed. MEC detection instruments would be available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible. The site-specific work plans outlining planned MEC removal protocols would be available for regulatory agency and public review.

After MEC removal is conducted, quality control and quality assurance activities would be implemented.

3.3.2.1.2 Subsurface MEC Removal

This methodology would consist of identification of MEC (conduct a visual search and operate MEC detection equipment to locate subsurface items) and investigation and removal of any MEC. Munitions debris and range-related debris (anticipated to be 2-inches in diameter or larger; however, detailed specifications would be identified in the site-specific work plan) that is found/detected during the process may also be removed.

Subsurface MEC removal depths would be determined based on (1) the type of MEC, (2) the typical depth the type of MEC is found, and (3) the capabilities of the geophysical detection equipment selected as best suited for site conditions. The site-specific work plans outlining planned MEC removal protocols would be available for regulatory agency and public review.

Within areas that may be selected for subsurface MEC removal, there may be areas that contain significant amounts of MEC and/or metallic debris that preclude the use of typical methods of removal (e.g., ‘mag and dig’). These areas may require large-scale excavations to remove the MEC present in the subsurface. The HMP and associated biological opinions currently limit the amount of temporary habitat destruction to 75 acres (USACE, 2005; USFWS, 1999, 2002, 2005; BLM, Army; 2004; Zander, 2002; 2007). The Army is required to ensure that habitat and species within any large-scale excavations recover. The impacted areas must be monitored in accordance with the HMP and biological opinions to determine if the HMP success criteria have been achieved. It may be necessary to conduct active habitat restoration as a corrective action in order to meet the requirements of the HMP. Depending on the size of these large-scale excavations, it may also be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act.

Based on a review of currently available MEC-related data, an estimated total of approximately 320 acres of the Impact Area MRA could contain significant amounts of MEC and/or metallic debris and may require large-scale excavations to remove the MEC present in the subsurface (Plate 5, RI; Volume I). For the purpose of this FS, this effort is assumed to include sifting the top 2-foot layer of soil.

A digital geophysical survey (“digital mapping”) would also be performed using the best appropriate technology to provide a record of anomalies identified during the survey (see Section 3.3.2.3). Anomalies identified during the survey would be investigated or resolved.

After the MEC removals are conducted, quality control and quality assurance procedures would be implemented.

3.3.2.2 MEC Detonation

Detonation with Engineering Controls is considered the safest method for MEC detonation because it minimizes direct exposure of workers to MEC, and is assumed to be the method applied during MEC removal actions at the Impact Area MRA. Any explosive items identified would be detonated using DDESB-approved MEC detonation procedures that would be described in the implementation work plan. The Army is currently evaluating the need for any potential modifications to current detonation with engineering controls procedures for use at the former Fort Ord.

The Detonation with Engineering Controls technology consists of applying detonating charges to single or consolidated MEC items, and applying engineering controls (covering the MEC with tamped dirt, sandbags, contained water, or other materials) prior to detonation to control the blast and any fragmentation, emissions, or noise that would be associated with the detonation. This method was demonstrated to be effective during the Ranges 43-48 Interim Action within the Impact Area MRA, and would be applicable and well suited for detonations in this area because it can be performed in any location MEC is found during MEC removal actions.

The Detonation Chamber technology was also considered. This consists of operation of a blast chamber for transportable MEC items. The Donovan Chamber is the only type of blast chamber approved for use by the DDESB, and is a detonation containment device capable of withstanding multiple detonations. Detonation of transportable MEC items using this method would reduce noise and emissions, contain

fragmentation, and reduce fire risks associated with detonations. However, application of this technology would require handling and transfer of MEC by UXO-Qualified Personnel over the 6,560 total acres of land found at the Impact Area MRA to temporary chamber locations immediately within access of the area being cleared. Due to its limited application to a small percentage of the anticipated MEC items, and the technical and safety constraints involved in transporting the chamber or transporting MEC items to the chamber, it is not considered further for use at the Impact Area MRA

3.3.2.3 Digital Mapping of Anomalies

After conducting MEC removals on the surface, digital mapping would be performed using the best appropriate technology, and would digitally record and locate anomalies identified during the survey. A map of the anomalies would be included in the after-action report to assist future property users in identifying areas with specific MEC safety support requirements for surface or subsurface activities and to assist in land management decision making. Digital mapping would require manual and/or mechanical cutting of the burned vegetation in order to provide access to the digital geophysical equipment. Digital geophysical detection equipment and associated Standard Operating Procedures (SOPs) would be determined in the implementation work plan based on site conditions and according to USACE Data Item Description (DIDs), site-specific Quality Control (QC) criteria (which can be considered Data Quality Objectives [DQOs]), and in accordance with the *Ordnance Detection and Discrimination Study for Fort Ord* (Parsons, 2002a) and other guidance. Digital mapping in some areas may not be implementable based on site conditions such as difficult terrain that prevent equipment access or operation; these areas would be documented in the After-Action report and digital mapping records.

3.3.2.4 Post-Remediation Habitat Monitoring

The HMP requires habitat monitoring be conducted following MEC remedial action to assess the recovery of HMP species. Baseline monitoring would be conducted in each area where MEC remedial action is planned. Follow-up monitoring would then be conducted in accordance with the Vegetation Monitoring Plan and Wetland Monitoring and Restoration Plan (Burleson, 2006, 2007) for (1) HMP annual plants, and (2) HMP shrubs, and (3) wetland species. Results of monitoring would be documented in annual reports submitted to the U.S. Fish and Wildlife Service (USFWS) and California Department of Fish and Game (CDFG).

4.0 DEVELOPMENT OF REMEDIAL ALTERNATIVES

This section presents the Long Term Management Measures that will be implemented at the Impact Area MRA; the development of remedial alternatives for the Impact Area MRA based on the response actions identified in Section 3.0 as shown on Figure 1; and a discussion of potentially applicable ARARs associated with implementation of the remedial alternatives.

4.1 Long Term Management Measures Specific to the Impact Area MRA

This section describes the Long Term Management Measures that are specific to the Impact Area MRA. These measures will be applied to implement and manage the remedial alternatives selected for the Impact Area MRA, and as such, are not risk management measures or response actions and are not screened or evaluated for reuse area-specific applicability. These measures would be described in further detail in the LUCI RD/RAWP.

Property Transfer Documentation

The Army will specify MEC-related land use controls in the property transfer document that (1) informs future property owners MEC was found and removed at the area; (2) specifies requirements that must be met prior to performing certain activities at the area; and (3) outlines appropriate procedures to be followed in the event that MEC is encountered during reuse. Specific types of restrictions would vary depending on the conditions, potential MEC risks, and anticipated future land use. The Army will follow appropriate federal property management regulations. The property transfer document would identify who would be responsible for implementation, monitoring, reporting, and enforcement. The restrictions identified in the ROD would be described in further detail in the LUCI RD/RAWP.

Property transfer document restrictions regarding potential MEC risks at the Impact Area MRA would establish the appropriate restriction that indicates:

- Specified reuses evaluated in the RA that were designated and approved at the time the Army transfers the property must be maintained by all property owners. Unrestricted land use, typically represented by a residential exposure scenario by the regulatory agencies, would be prohibited.
- Potential MEC risks may significantly increase if changes in the designated and approved reuse are implemented.
- Any modifications to these restrictions must be approved by the project team (the Army, EPA, and DTSC; a part of Cal/EPA) prior to implementation.

At the time of the five-year review, the Army or Army's representatives, in consultation with the property users and regulatory agencies, would assess whether the restrictions continue to be protective or require modifications.

Annual Monitoring and Five-Year Review Reporting

The Army will monitor the Impact Area MRA on an annual basis, and collect and report any MEC-related data that may be discovered after transfer of the property. The Army will report results of the annual

monitoring on a yearly basis. If MEC is encountered at the area during reuse (1) MEC incident reporting will be performed; (2) the project team (the Army, EPA, and DTSC; a part of Cal/EPA) will be notified; and (3) the need for re-evaluation of the protectiveness of the area under the current remedy would be assessed by the project team.

A review of the remedies selected for the Impact Area MRA will be conducted within 5 years after implementation. The purpose of the five-year review is to determine whether the remedy at a reuse area continues to be protective of human health and the environment (1) after a period of 5 years from the time the remedy was implemented, or (2) from the time of a previous five-year review. The results of annual monitoring and the methods, findings, and conclusions of the five-year review will be documented in a five-year review report, which will identify any recommendations to address them as appropriate.

At the time of each five-year review, the Army or Army's representatives would assess the status of the annual monitoring program based on the established reuse for each area, and document any recommendations or modifications to the program as described in the LUCI RD/RAWP.

4.2 Identification of Response Actions

Three different response actions are considered in this FS in the development of remedial alternatives for the Impact Area MRA as shown on Figure 1:

- **No Further Action**—Provided as a baseline for comparison to the other remedial alternatives as required under CERCLA and the NCP and described in Section 3.1.
- **Land Use Controls**—As described in Section 3.2, includes a range of potential components, including: prohibitions on unrestricted reuse in property transfer documentation; MEC recognition and safety training; construction monitoring by UXO-Qualified Personnel, and support during reuse activities; access management measures that could include maintaining a perimeter fence and signs; law enforcement security patrols; and onsite helicopters for fire suppression during select future HMP/HCP prescribed burns.
- **MEC Remediation**—As described in Section 3.3, vegetation clearance via prescribed burning would be implemented using a phased approach of conducting prescribed burning and MEC removals. Each contiguous prescribed burned area would not exceed 400 acres as specified under the HMP, unless specifically coordinated with USFWS; under the HMP, no more than 800 acres of the 6,560-acre Impact Area MRA would be allowed to be prescribed burned in any given year. The remedial action could include technology-aided surface removal and/or subsurface MEC removal, and would be completed over a period of approximately 10 to 22 years. All detected MEC would be removed and destroyed by detonation using an appropriate DDESB-approved method.

4.3 Development of Remedial Alternatives

The potentially applicable alternatives that would provide mitigation of potential After Action MEC risks for those receptors identified in the RA (Section 4.0; Volume I) at the Impact Area MRA were developed based on the applicable components of the response actions described above in Section 3.0.

As described in Section 2.2.1, the risk assessment for the Impact Area MRA assumed two different MEC removal actions could be implemented to address potential MEC risks: (1) technology-aided surface MEC removal (with MEC detection instruments available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible), and (2) subsurface MEC removal. Based

on the risk assessment, it is anticipated that unrestricted use that would allow unrestricted intrusive activities will be unacceptable after conducting either surface or subsurface MEC removals. Note that a potential residential receptor that could be expected to have intrusive activities as deep as 4 to 5 feet would have similar risk scores as a construction worker (potential After Action MEC Risk is E). Therefore, an unrestricted land use, typically represented by a residential exposure scenario by the regulatory agencies, would be prohibited. Appropriate land use controls would be necessary for proper management of any potential residual MEC risks. As described in Section 2.2, the objective of the remedial alternatives evaluation presented in this FS is to support the reuse of the Impact Area MRA as a habitat reserve. The HMP and additional requirements designate the entirety of the Impact Area MRA as a Natural Resource Management Area, and the Fort Ord Reuse Plan (as updated) designates the entirety of the Impact Area MRA as a Habitat Reserve.

Although surface and subsurface MEC removals would result in eliminating many MEC items from the site and reducing the possibility of future exposures, it would not be possible to verify all MEC items were removed to all depths. Therefore, a possibility would remain that an intruding receptor could encounter a MEC item. The results of the risk assessment indicate that potential After Action MEC Risk scores would remain in the high range for those receptors conducting intrusive activities. Therefore, Land Use Controls described in Section 3.2 will be evaluated as part of remedial alternatives to support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management). These land use controls will allow for proper management of the habitat reserve as described in the HMP and additional requirements.

4.4 Description of Remedial Alternatives

Four potential remedial alternatives were developed for the Impact Area MRA as described in the following sections, based on the applicable components of the response actions described above in Section 3.0, to provide a range of remedial approaches to (1) address potential After Action MEC risks for those receptors identified in the RA (Section 4.0; Volume I), and (2) allow for proper management of the Impact Area MRA as a habitat reserve.

The detailed analysis of the remedial alternatives presented in Section 5.0 provides further discussion of the assumptions used in estimating costs associated with implementing each of the components of the alternatives.

4.4.1 Alternative 1—No Further Action

This alternative assumes no further action would be taken to address potential After Action MEC risks for those receptors identified in the RA (Section 4.0; Volume I). This alternative is provided as a baseline for comparison to the other remedial alternatives as required under CERCLA and the National Contingency Plan (NCP) as described in Section 3.1.

4.4.2 Alternative 2—Technology-Aided Surface MEC Remediation and Land Use Controls

This alternative assumes Technology-Aided Surface MEC Remediation would be conducted throughout the entire Impact Area MRA. MEC detection instruments would be available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible. The prescribed burning and MEC removal actions would be conducted in stages, and a site-specific work plan would be developed for each phase of work. The work plan would describe the anticipated distribution of MEC, the vegetation

clearance plan, and the method for completion of the removal. It is assumed prescribed burning (followed by MEC remedial action) would be conducted in stages and consist of several small burns (approximately 100-acre units as described in Section 3.3.1.1) rather than one large burn. During each mobilization, a contiguous area of up to 400 acres would be burned (unless specifically coordinated with USFWS). Planned prescribed burns would not exceed 800 acres per year as allowed by the HMP for Habitat Reserve areas at the former Fort Ord. Therefore, for the purpose of this FS, MEC remedial actions would be conducted on up to 800 acres of the Impact Area MRA each year for approximately 8 years.

The Technology-Aided Surface MEC Remediation and Land Use Controls Alternative would include the following components:

- Prescribed burning to clear vegetation and provide access for MEC removals;
- Technology-aided surface MEC removal throughout the entire Impact Area MRA, and detonation with engineering controls of any MEC identified. MEC detection instruments would be available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible;
- Digital mapping to provide a record of remaining anomalies and to assist future property users in identifying areas with specific MEC safety support requirements for surface or subsurface activities; and
- Implementation of Land Use Controls (MEC recognition and safety training; construction monitoring for intrusive activities; UXO-qualified personnel support; access management measures, including regular security patrols of the Impact Area MRA perimeter and maintaining a perimeter fence and signs; fire suppression helicopters for select future HCP prescribed burn support; and property transfer documentation outlining the prohibition of unrestricted land use and any other reuse restrictions or conditions).

It should be noted that digital mapping would require manual and/or mechanical cutting of the burned vegetation in order to provide access to the digital geophysical equipment. Manual and mechanical cutting of maritime chaparral immediately following a prescribed burn is protective of the seedbank and is consistent with the HMP and Biological Opinions. Post-remediation habitat monitoring would be required. Digital mapping in some areas may not be implementable based on site conditions such as difficult terrain that prevent equipment access or operation; these areas would be documented in the After-Action report and digital mapping records.

Under this alternative, reusers conducting surface-only activities such as habitat monitoring and prescribed burning would be provided MEC recognition and safety training. Public access would be managed or restricted (e.g., accompanied by person(s) who have received MEC recognition and safety training). In addition, regular security patrols would be conducted along the perimeter of the Impact Area MRA to enforce access restrictions, and a perimeter fence and signs would be maintained. Intrusive activities such as erosion control, some invasive weed control, and facility development (construction) activities would be conducted with construction monitoring by UXO-Qualified Personnel, and MEC recognition and safety training would also be provided for workers conducting intrusive activities. A team of two full-time onsite UXO-qualified personnel would be available to provide long-term support during reuse of the property.

To address potential changes in site conditions due to erosion, the site would be assessed within 1 year of MEC removal to identify areas where MEC may be present at the surface due to erosion. Annual surface

reconnaissance/monitoring would be conducted following the surface removal by the Army until vegetation regrowth is sufficient to stabilize the site. Any areas where erosion and/or MEC were identified would then be placed in a monitoring program and additional surface removal would be conducted as appropriate. In addition, after the property is transferred, UXO-qualified personnel would be available for long-term support of reuse activities. After property transfer, the UXO-qualified personnel could perform additional surface reconnaissance if/as needed following prescribed burns that may be conducted by the future landowner.

Future 100-acre HMP/HCP prescribed burns would be conducted after property transfer for fire and habitat management purposes by the future landowner. The possible presence of subsurface MEC could make the use of hand crews and heavy equipment unsafe in some areas to address spot fires that may occur. The use of alternative methods to address spot fires could involve requirements for additional resources in those instances; therefore, an onsite fire suppression helicopter would be provided on an as needed basis for the duration of prescribed burning activities.

4.4.3 Alternative 3—Subsurface MEC Remediation and Land Use Controls

This alternative assumes Subsurface MEC Remediation would be conducted throughout the entire Impact Area MRA. The prescribed burning and MEC removal actions would be conducted in stages, and a site-specific work plan would be developed for each phase of work. The work plan would describe the anticipated distribution of MEC, the vegetation clearance plan, and the method for completion of the removal. It is assumed prescribed burning (followed by MEC remedial action) would be implemented using a phased approach and consist of several small burns (approximately 100-acre units as described in Section 3.3.1.1) rather than one large burn. During each mobilization, a contiguous area of up to 300 acres would be burned. Based on the implementation of interim action at Ranges 43 through 48, it is assumed that approximately 300 acres per year of subsurface MEC removals is implementable before the vegetation grows back. Therefore, for the purpose of this FS, Subsurface MEC Remediation would be conducted on 300 acres of the Impact Area MRA each year for approximately 22 years.

The Subsurface MEC Remediation and Land Use Controls Alternative would include the following components:

- Prescribed burning to clear vegetation and provide access to conduct MEC removals;
- MEC removal on the surface and in the subsurface throughout the entire Impact Area MRA (intrusive investigation of all anomalies), and detonation with engineering controls of any UXO identified;
- Digital mapping to provide a digital record, and investigation of remaining anomalies;
- Implementation of Land Use Controls (MEC recognition and safety training; construction monitoring for intrusive activities; UXO-qualified personnel support; access management measures, including regular security patrols of the Impact Area MRA perimeter and maintaining a perimeter fence and signs; and property transfer documentation outlining the prohibition of unrestricted land use and any other reuse restrictions or conditions); and
- Post-remediation habitat monitoring (collecting data on HMP species and habitats, and perform mapping, data management and evaluation, and reporting).

Based on a review of currently available MEC-related data, a total of approximately 320 acres of the Impact Area MRA could contain significant amounts of MEC and/or metallic debris and may require large-scale excavations to remove the subsurface MEC (Plate 5, RI; Volume I). For the purpose of this FS, this effort is assumed to include sifting the top 2-foot layer of soil. Post-remediation habitat restoration and monitoring would be required. It should be noted that the size of area that would require excavation and sifting is approximate; it could only be confirmed during MEC remediation. Based on the approximate size of these large-scale excavations, it will likely be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act.

It should be noted that subsurface removal and digital mapping would require manual and/or mechanical cutting of the burned vegetation. Manual and mechanical cutting of maritime chaparral immediately following a prescribed burn is protective of the seedbank and is consistent with the HMP and Biological Opinions. Post-remediation habitat monitoring would be required. Digital mapping in some areas may not be implementable based on site conditions such as difficult terrain that prevent equipment access or operation; these areas would be documented in the After-Action report and digital mapping records.

Under this alternative, workers conducting surface-only activities such as habitat monitoring and prescribed burning would be provided MEC recognition and safety training. In addition, regular security patrols would be conducted along the perimeter of the Impact Area MRA to enforce access restrictions, and a perimeter fence and signs would be maintained. Public access would be managed or restricted (e.g., restricted to designated roads and trails). Intrusive activities such as erosion control, some invasive weed control, and facility development (construction) activities would be conducted with construction monitoring by UXO-Qualified Personnel, and MEC recognition and safety training would be provided for workers conducting intrusive activities. A team of two full-time onsite UXO-qualified personnel would be available to provide long-term support during reuse of the property. Existing access roads would continue to be available for vehicle access.

4.4.4 Alternative 4—Technology-Aided Surface MEC Remediation, With Subsurface MEC Remediation in Selected Areas, and Land Use Controls

This alternative assumes Technology-Aided Surface MEC Remediation would be conducted throughout the entire Impact Area MRA, and Subsurface MEC Remediation would be conducted in selected areas as described below.

The components of this alternative would be as described for these alternatives above. As under the Technology-Aided Surface MEC Remediation and Land Use Controls Alternative (Alternative 2), the prescribed burning and MEC removal actions would be conducted in stages, and a site-specific work plan would be developed for each phase of work. The work plan would describe the anticipated distribution of MEC, the vegetation clearance plan, and the method for completion of the removal. It is assumed prescribed burning (followed by MEC remedial action) would be conducted in stages and consist of several small burns (approximately 100-acre units as described in Section 3.3.1.1) rather than one large burn. During each mobilization, a contiguous area of up to 400 acres would be burned (unless specifically coordinated with USFWS). Planned prescribed burns would not exceed 800 acres per year as allowed by the HMP for Habitat Reserve areas at the former Fort Ord. Therefore, for the purpose of this FS, MEC remedial actions would be conducted on 800 acres of the Impact Area MRA each year for approximately 8 years.

The Technology-Aided Surface MEC Remediation, With Subsurface MEC Remediation in Selected Areas, and Land Use Controls Alternative would include the following components:

- Prescribed burning to clear vegetation and provide access to conduct MEC removals.
- Technology-aided surface MEC removal throughout the entire Impact Area MRA, and detonation with engineering controls of any UXO identified. MEC detection instruments would be available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible.
- Subsurface MEC removals (intrusive investigation of all anomalies) in selected areas such as on fuel breaks and roads essential to habitat management activities, and for other limited areas that may require subsurface MEC removal for specific purposes to support the reuse as described below (for the purposes of this FS, assumed to be approximately 10 percent [656 acres] of the 6,560 acre Impact Area MRA).
- Digital mapping to provide a record of remaining anomalies and to assist future property users in identifying areas with specific MEC safety support requirements for surface or subsurface activities. Anomalies within the areas identified for subsurface MEC removals would be investigated or resolved. The digital map could be used by the future landowner to assist in land management decision making. The digital mapping would require manual and/or mechanical cutting of the burned vegetation in order to provide access to the digital geophysical equipment.
- Anomalies within the areas identified for subsurface MEC removals will be investigated or resolved.
- Implementation of Land Use Controls (MEC recognition and safety training; construction monitoring for intrusive activities; UXO-qualified personnel support; access management measures, including regular security patrols of the Impact Area MRA perimeter and maintaining a perimeter fence and signs; fire suppression helicopters for select future HCP prescribed burn support; and property transfer documentation outlining the prohibition of unrestricted land use and any other reuse restrictions or conditions).
- Post-remediation habitat monitoring within the areas of subsurface MEC removals (collecting data on HMP species and habitats, and perform mapping, data management and evaluation, and reporting).

Portions of Impact Area MRA Where Subsurface MEC Removal Would be Implemented in Selected Areas

Subsurface MEC removal in selected areas would be conducted in portions of the Impact Area MRA to address specific reuse concerns and needs. For the purposes of this FS, the total area of subsurface MEC removals is assumed to be approximately 10 percent (656 acres) of the 6,560 acre Impact Area MRA. The following portions of the Impact Area MRA are anticipated to be selected for implementation of subsurface MEC removals:

- Regularly maintained fuel breaks and access roads identified by the Army and future landowner for habitat management;
- A minimum 100-foot buffer area along the habitat-development border of the Impact Area MRA on the habitat side of the border that is adjacent to developed areas, and would act as an additional safety zone to provide firefighters with the ability to fight wildfires that might occur within the Impact Area

from the border buffer area. The firefighters would be able to temporarily widen fuel breaks under such circumstances, to protect life and property on the development side of the border. Per the HMP, fuel breaks are to be maintained on the development side of the border. The width of the buffer could be widened based on area-specific conditions that will be specified in the site-specific work plans for each phase of work. Vegetation would be allowed to regrow in the 100-foot buffer following Subsurface MEC Removal.

- Other areas to address specific risk and/or reuse needs, such as proposed, future habitat restoration sites, and areas of high density anomalies that are associated with sensitive-type munitions (assumed to be approximately 85 acres of the Impact Area MRA) that would be candidates for subsurface MEC removals via excavation and sifting as further described below.

Based on a review of currently available MEC-related data, a total of approximately 85 acres of the Impact Area MRA could contain significant amounts of MEC and/or metallic debris involving sensitively fuzed munitions types (Plate 5, RI; Volume I). These areas are candidates for additional actions (subsurface removal) in order to make it safe for future reusers. For the purpose of this FS, this effort is assumed to include sifting the top 2-foot layer of soil. Post-remediation habitat restoration and monitoring would be required. It should be noted that the size of area that would require excavation and sifting is approximate; it could only be confirmed during MEC remediation. Depending on the actual size of these large-scale excavations, it may also be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act.

After technology-aided surface MEC removals are completed for each phase of work described in the site-specific work plans, digital geophysical mapping will be conducted. Following the geophysical mapping the Army will review the data and prepare a Technical Memorandum to EPA and DTSC that will present an evaluation of the work completed to date and if necessary, describe additional subsurface removals recommended based on the results of the initial work. Factors that would be considered when determining whether additional actions are necessary include, but are not limited to: (1) type of MEC encountered and danger associated with MEC; (2) proximity to potential receptors; (3) density of items; and (4) consistency with ARARs. If no additional work is required this would also be documented in the Technical Memorandum along with the rationale for no further removal actions.

Each Technical Memorandum would be an addendum to the site-specific work plan, and therefore, would be associated with a primary document and be disputable. To avoid impacts to the rare, threatened and endangered species, completion and agency approval of the Technical Memorandum will be expedited to allow any additional actions to be executed before the next growing season. Each Technical Memorandum and associated correspondence would be made available to the public in the Administrative Record.

Under this alternative, workers conducting surface-only activities such as habitat monitoring and prescribed burning would be provided MEC recognition and safety training. In addition, regular security patrols would be conducted along the perimeter of the Impact Area MRA to enforce access restrictions, and a perimeter fence and signs would be maintained. Public access would be managed or restricted (e.g., accompanied by person(s) who have received MEC recognition and safety training). Intrusive activities such as erosion control, some invasive weed control, and facility development (construction) activities would be conducted with construction monitoring by UXO-Qualified Personnel, and MEC recognition and safety training would be provided for workers conducting intrusive activities. A team of two full-time onsite UXO-qualified personnel would be available to provide long-term support during reuse of the property. Existing access roads would continue to be available for vehicle access.

To address potential changes in site conditions due to erosion, the surface removal areas would be assessed within 1 year of MEC removal to identify areas where MEC may be present at the surface due to erosion. Annual surface reconnaissance/monitoring would be conducted following the surface removal until vegetation regrowth is sufficient to stabilize the site. Any areas where erosion and/or MEC were identified would then be placed in a monitoring program and additional surface removal would be conducted as appropriate. In addition, after the property is transferred, UXO-qualified personnel would be available for long-term support of reuse activities. After property transfer, the UXO-qualified personnel could perform additional surface reconnaissance if/as needed following prescribed burns that may be conducted by the future landowner.

Post-remediation digital mapping would require manual and/or mechanical cutting of the burned vegetation in order to provide access to the digital geophysical equipment. Manual and mechanical cutting of maritime chaparral immediately following a prescribed burn is protective of the seed bank and is consistent with the HMP and Biological Opinions. Post-remediation habitat monitoring would be required. Digital mapping in some areas may not be implementable based on site conditions such as difficult terrain that prevent equipment access or operation; these areas would be documented in the After-Action report and digital mapping records.

Future 100-acre HCP prescribed burns will be conducted for fire and habitat management purposes by the future landowner. The possible presence of subsurface MEC could make the use of hand crews and heavy equipment unsafe in some areas to address spot fires that may occur. The use of alternative methods to address spot fires could involve requirements for additional resources in those instances; therefore, an onsite fire suppression helicopter would be provided on an as needed basis for the duration of prescribed burning activities.

5.0 EVALUATION AND COMPARISON OF REMEDIAL ALTERNATIVES

This section presents the evaluation and comparison of the four remedial alternatives identified in Section 4.3 that would provide mitigation of potential MEC risks for receptors assumed to reuse the Impact Area MRA based on the nine CERCLA evaluation criteria specified in the EPA's RI/FS Guidance (EPA, 1989).

The four remedial alternatives developed for the Impact Area MRA that are evaluated and compared below include:

- Alternative 1: No Further Action
- Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls
- Alternative 3: Subsurface MEC Remediation and Land Use Controls
- Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls.

Table 2 summarizes the evaluation and comparison of potentially applicable remedial alternatives based on the following nine evaluation criteria specified in the EPA's RI/FS Guidance (EPA, 1989).

Threshold Criteria (Remedial Action Objectives; See Section 2.2)

(1) Overall Protection of Human Health and the Environment – An alternative must eliminate, reduce, or control potential threats to public health and the environment through treatment or institutional controls.

(2) Compliance with Applicable, Relevant and Appropriate Requirements (ARARs) – The alternative must meet Federal and State environmental statutes, regulations, and other requirements that pertain to the site or area unless a waiver is justified.

Balancing Criteria

(3) Long-Term Effectiveness and Permanence – Considers the ability of an alternative to maintain protection of human health and the environment over time.

(4) Reduction of Toxicity, Mobility, or Volume Through Treatment – Evaluates the alternative's use of treatment (for which there is a statutory preference) to reduce the harmful effects of principal contaminants, their ability to move in the environment, and the amount of contamination present.

(5) Short-Term Effectiveness – Considers the length of time needed to implement an alternative and the risks the alternative poses to workers, residents, and the environment during implementation.

(6) Implementability – Considers the technical and administrative feasibility of implementing the alternative, including factors such as the relative availability of goods and services. Technical feasibility considerations include the availability of services, necessary equipment, and skilled workers to implement a particular alternative. Administrative feasibility includes obtaining necessary permits and regulatory approvals for implementation of the alternative.

(7) *Cost* – Capital and long-term management (LTM) costs are estimated for each alternative based on quotes for labor, materials, and equipment necessary to implement the alternative. For annual LTM costs, the net present value (NPV) is calculated over the expected period of years it will take to implement the alternative based on real discount rates (similar to interest rates) that vary according to the period of performance for federal projects. For those alternatives whose life-cycle is indeterminate or exceeds 30 years, for the purposes of evaluating and comparing alternatives as specified in EPA's RI/FS Guidance (EPA, 1989), a period of 30 years is used for estimating long term LTM costs. USACE/EPA provide guidelines for estimating remedial alternative costs in Office of Soil Waste and Emergency Response (OSWER) Directive 9355.0-75 (January 2007; updated yearly), Office of Management and Budget (OMB), Executive Office of the President, Appendix C. The guidelines for federal projects are applied to cost estimates provided by Army/USACE contractors for the alternatives. These cost estimates are intended to have an accuracy of +50 percent/-30 percent.

Modifying Criteria

(8) *State Acceptance* – Evaluates technical and administrative issues and concerns that the state may have regarding each alternative. State Acceptance will be addressed in the Impact Area MRA RI/FS ROD once comments on the RI/FS report and Proposed Plan have been received (EPA, 1989).

(9) *Community Acceptance* – Evaluates issues and concerns that the public may have regarding each alternative. Community Acceptance will be addressed in the Impact Area MRA RI/FS ROD once comments on the report and Proposed Plan have been received (EPA, 1989).

5.1 Evaluation of Remedial Alternatives

This section presents the evaluation of the four remedial alternatives developed for the Impact Area MRA based on each of the nine CERCLA evaluation criteria described above.

5.1.1 Overall Protection of Human Health and the Environment

5.1.1.1 Overall Protection of Human Health

Alternative 1: No Further Action

The baseline MEC Risks since no MEC removal would be conducted would be the highest risk (E) for all receptors. This alternative would not be protective of human health in the long term for the receptors assumed in the Risk Assessment (RA) to reuse the Impact Area MRA during habitat management and monitoring activities under the HMP and other requirements (such as vegetation management via prescribed burning, monitoring, and maintenance of fuel breaks and roads essential for fire fighting activities). MEC is known to be present on the surface and likely in the subsurface and would pose MEC risks during reuse of the area.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls

The hypothetical After Action MEC Risks associated with a technology-aided surface removal (with MEC detection instruments available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible) are highest risk (E) for all intruding receptors and a medium risk (C) for surface only receptors. Technology-aided surface MEC removal would provide protection of human health by removing all detected MEC on the surface; however, MEC would not be removed from

the subsurface, and MEC could potentially be exposed over time in erosion-prone areas; periodic monitoring would detect and address such areas.

Land Use Controls would be protective of human health, including: (1) prohibitions on unrestricted reuse; (2) MEC recognition and safety training; (3) construction monitoring during any intrusive activities; (4) the availability of full-time onsite UXO-Qualified Personnel to provide safety education and UXO support as needed; (5) access management measures, including maintaining a perimeter fence and signs, and law enforcement support to prevent unauthorized access into the Impact Area MRA; and (6) helicopter support during select future HMP/HCP prescribed burns conducted by the future land owner. The Army recognizes that due to the presence of subsurface MEC these measures are necessary to provide protection of human health for reusers. The combination of technology-aided surface MEC remediation and Land Use Controls would support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management) and allow for proper management of the habitat reserve as described in the HMP and additional requirements. In addition, prohibition of unrestricted land use would provide additional protection of human health.

Because subsurface MEC removal would not be conducted under this alternative, the possibility of MEC remaining below the surface along the boundary of the Impact Area MRA would need to be considered during development of adjacent property, and is expected to be addressed in a manner that is protective of human health and the environment. After remedial actions to remove surface MEC have been conducted, residual After Action MEC risks may be re-evaluated using site-specific MEC removal data, which, in addition to the digital geophysical mapping information, would be considered in verifying the appropriateness of remedial Land Use Control components.

Alternative 3: Subsurface MEC Remediation and Land Use Controls

The hypothetical After Action MEC Risks associated with a subsurface MEC removal for all receptors intruding below 1 foot remain highest risk (E). For shallow intruding receptors (those intruding less than one foot) and for surface only receptors the risk is lowest (A). Subsurface MEC removal would provide protection of human health by removing all detected MEC on the surface and in the subsurface; however, the potential for MEC to be present on the subsurface would remain.

Land Use Controls would be protective of human health, including: (1) prohibitions on unrestricted reuse; (2) MEC recognition and safety training; (3) construction monitoring during any intrusive activities; (4) the availability of full-time onsite UXO-Qualified Personnel to provide safety education and UXO support as needed; (5) access management measures, including maintaining a perimeter fence and signs, and law enforcement support to prevent unauthorized access into the Impact Area MRA. The combination of subsurface MEC remediation and Land Use Controls would support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management) and allow for proper management of the habitat reserve as described in the HMP and additional requirements. In addition, prohibition of unrestricted land use would provide additional protection of human health.

Although subsurface MEC removal would be conducted under this alternative, the possibility of MEC remaining in the subsurface along the boundary of the Impact Area would need to be considered during development of adjacent property, and is expected to be addressed in a manner that is protective of human health. After remedial actions to remove all detected surface and subsurface MEC, residual After Action MEC risks may be re-evaluated using site-specific MEC removal data, which, in addition to the digital geophysical mapping information, would be considered in verifying the appropriateness of the remedial Land Use Control components.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls

The hypothetical After Action MEC Risks associated with the two different MEC remediation alternatives are described above under Alternatives 2 and 3. Alternative 4 offers a combination of the two approaches. This alternative includes a technology-aided surface MEC removal throughout the Impact Area MRA, and subsurface MEC removal in selected areas including: (1) fuel breaks and access roads; (2) a safety buffer area along the habitat-side of the development border of the Impact Area MRA, that would act as an additional safety zone and provide firefighters with the ability to fight wildfires that might occur within the Impact Area from the border; and (3) other areas to address specific risk and/or reuse needs. The proposed safety buffer would reduce the potential for casual MEC encounters by trespassers in areas that are potentially more susceptible to trespassing due to proximity to development areas.

Technology-aided surface MEC removal would provide protection of human health by removing all detectable MEC on the surface and in approximately 10 percent of the subsurface in selected areas where greater risk reduction would further facilitate reuse of the area as a habitat reserve, as described above. For the purposes of this FS, subsurface MEC removal is assumed to be implemented in approximately 10 percent of the Impact Area MRA. However, MEC would not be removed from approximately 90 percent of the subsurface, and MEC could potentially be exposed over time in erosion-prone areas; periodic monitoring would detect and address such areas. Land Use Controls would be protective of human health, including: (1) prohibitions on unrestricted reuse; (2) MEC recognition and safety training; (3) construction monitoring during any intrusive activities; (4) the availability of full-time onsite UXO-Qualified Personnel to provide safety education and UXO support as needed; (5) access management measures, including maintaining a perimeter fence and signs, and law enforcement support to prevent unauthorized access into the Impact Area MRA; and (6) helicopter support during select future HMP/HCP prescribed burns conducted by the future land owner. The Army recognizes that due to the presence of subsurface MEC these measures are necessary to provide protection of human health for reusers. The combination of technology-aided surface MEC remediation, subsurface MEC remediation in selected areas, and Land Use Controls would support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management) and allow for proper management of the habitat reserve as described in the HMP and additional requirements. In addition, prohibition of unrestricted land use would provide additional protection of human health.

Although subsurface MEC would be removed from a safety buffer along the habitat-development border under this alternative, the possibility of MEC remaining in the subsurface along the boundary of the Impact Area would need to be considered during development of adjacent property, and is expected to be addressed in a manner that is protective of human health. After remedial actions to remove all detected surface and subsurface MEC, residual After Action MEC risks may be re-evaluated using site-specific MEC removal data, which, in addition to the digital geophysical mapping information, would be considered in verifying the appropriateness of the remedial Land Use Control components.

5.1.1.2 Overall Protection of the Environment

Natural Resources Background

Plate 5 shows the Fort Ord plant communities that are present within the Track 3 Impact Area MRA. The dominant community is the central maritime chaparral that covers about 6,066 acres of the Impact Area MRA. Other communities include the inland coast woodland community that comprises about 199 acres of the site, the grassland community (about 256 acres), and the wetland community that comprises about 24 acres of the site. A small portion of the site has been developed. Listed species present in the Impact

Area MRA include the California tiger salamander (*Ambystoma californiense*), sand gilia (*Gilia tenuiflora* ssp. *arenaria*), California goldfields (*Lasthenia conjugens*), Monterey spineflower (*Chorizanthe pungens* var. *pungens*), and Seaside bird's beak (*Cordylanthus rigidus* var. *litteralis*) including critical habitat designated for Monterey spineflower.

The Impact Area MRA is also home for the federally threatened California tiger salamander, which uses approximately 31 acres of vernal pools for reproduction and the remaining 1,444 acres of adjacent habitat for upland refuge. In addition to the listed species, the Impact Area MRA is also home to many other rare species including state endangered seaside bird's beak, Monterey manzanita (*Arctostaphylos montereyensis*), sandmat manzanita (*Arctostaphylos pumila*), Hooker's manzanita (*Arctostaphylos hookeri*), Monterey ceanothus (*Ceanothus cuneatus* var. *rigidus*), Coast wallflower (*Erysimum ammophilum*), California black legless lizard (*Anniella pulchra nigra*), and California linderiella (*Linderiella occidentalis*).

Alternative 1: No Further Action

Natural Resources Impacts

The habitat would not be able to be managed with prescribed burn and other measures as required by the HMP and Biological Opinions. This would result in a change to the age structure of the CMC habitat, which would no longer have a mosaic of many different age classes but rather an older senescent stand of CMC that would not support the diversity of plants and animals currently inhabiting the Impact Area MRA. In addition, the CMC would continue to grow to a point that would pose a significant fuel load that would increase the threat of a wildfire.

Overall Protection of the Environment

This alternative would not be protective of the environment in the long term because all HMP and other requirements for management of the habitat such as prescribed burning could not be implemented due to the explosive safety threat posed by MEC remaining on the surface. Therefore, this alternative would not comply with special requirements as described in the HMP and additional requirements.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls

Natural Resources Impacts

This alternative would include vegetation clearance using prescribed fire with a limited amount of manual and mechanical vegetation cutting to provide the required temporary fuel breaks to keep the fire within the containment lines. The remaining burned vegetation would be cut to the ground following the prescribed burn to allow the safe and effective use of the digital mapping equipment. The habitat would be monitored as required by the HMP and biological opinions to ensure the habitat recovers consistent with the success criteria.

Overall Protection of the Environment

This alternative would provide protection of the environment at the Impact Area MRA because prescribed burning and surface MEC removal (including preparation of temporary fuel breaks) would be performed using methods that would comply with the HMP and additional requirements. Since no excavations for MEC are proposed under this alternative, impacts to listed species are expected to be minimal. Reasonable and prudent measures would be to be taken during these activities to mitigate possible impacts to listed species or critical habitat for species such as the California tiger salamander, California

goldfields, Monterey spineflower, sand gilia, and seaside bird's beak. In addition, post-remediation habitat monitoring would continue to be conducted in accordance with the Vegetation Monitoring Plan and Wetland Monitoring and Restoration Plan for (1) HMP annual plants, (2) HMP shrubs, and (3) wetland species (*Burleson, 2006, 2007*). Results of monitoring would be documented in annual reports submitted to the USFWS and California Department of Fish and Game (CDFG).

Alternative 3: Subsurface MEC Remediation and Land Use Controls

Natural Resources Impacts

This alternative involves conducting a prescribed burn and preparing temporary fuel breaks to facilitate a safe and efficient burn to clear vegetation from the site. The remaining burned vegetation would be cut to the ground following the prescribed burn and initial surface sweep of MEC to allow the safe and effective use of the digital mapping equipment and to conduct subsurface MEC removal. The entire site would then be searched for subsurface MEC where subsurface anomalies would be intrusively investigated and sources of the anomalies are removed to the depths identified. In addition, approximately 320 acres (estimated) identified as high-density anomaly areas would be excavated and sifted to remove subsurface metallic clutter and possibly MEC. This would result in significant impacts to the natural resources and it would likely take decades to recover. The areas that would be sifted would likely require active restoration (planting) and all portions of the site would be monitored as required by the HMP and biological opinions to ensure the habitat recovers consistent with the success criteria.

Overall Protection of the Environment

Prescribed burning (including preparation of temporary fuel breaks) and subsurface MEC removal (detection and investigation of individual anomalies) would be performed using methods that would comply with the HMP and additional requirements. Reasonable and prudent measures would be taken during these activities to mitigate impacts to listed species or critical habitat for species such as the California tiger salamander, California goldfields, and Monterey spineflower, sand gilia, and seaside bird's beak. Prescribed burning and subsurface MEC removal have been conducted in other areas at the former Fort Ord in accordance with these requirements without significant adverse impacts to biological resources based on habitat monitoring results. In addition, post-remediation habitat monitoring would continue to be conducted in accordance with the Vegetation Monitoring Plan and Wetland Monitoring and Restoration Plan for (1) HMP annual plants, and (2) HMP shrubs, and (3) wetland species (*Burleson, 2007; Burleson, 2006*). Results of monitoring would be documented in annual reports submitted to the USFWS and CDFG.

However, based on a review of currently available MEC-related data, an estimated total of approximately 320 acres of the Impact Area MRA could contain significant amounts of MEC and/or metallic debris that are anticipated to require large-scale excavations to remove the MEC in the subsurface, including sifting the top 2-foot layer of soil. For this portion of the Impact Area MRA, this alternative would not be protective of the environment due to the scale of the habitat impacts. Excavation and sifting of high anomaly density areas would cause significant impacts and loss of listed species, seedbank, or critical habitat for species such as the California tiger salamander, California goldfields, and Monterey spineflower, sand gilia, and seaside bird's beak. The HMP and additional requirements currently limit the amount of temporary habitat destruction to 75 acres. Therefore, for the 320 acres anticipated to require excavation and sifting for which temporary habitat destruction would exceed this limit; it would be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act. In addition, the Army is required to ensure that habitat and species within any large-scale excavations recover. It would also be necessary to conduct active habitat restoration as a

corrective action in order to meet the HMP and additional requirements. Successful restoration of CMC habitat has not been attempted in such a large scale, and the success of the restoration effort is uncertain. The impacted areas must be monitored in accordance with the HMP and additional requirements to determine if the HMP success criteria have been achieved.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Natural Resources Impacts

This alternative substantially reduces the explosive risks, but would also result in manageable impacts to the significant natural resources found on the site. This alternative results in the use of prescribed fire to clear the rare CMC habitat as required by the HMP and biological opinions. It also results in a technology aided surface removal following the manual/mechanical clearance of the remaining burned vegetation following a burn to allow the safe and effective use of the digital mapping equipment. The subsurface MEC removal areas (assumed to be approximately 10 percent of the site for the purpose of the FS) would include a safety buffer along the habitat–side of the development interface, permanent fuel breaks and access roads, and other areas as required by the future land owner to support their reuse (e.g. habitat restoration areas, etc.). Following the completion of MEC remediation, the land would be able to be managed as identified by the HMP, biological opinions, HCP, and other supporting documents. In addition, approximately 85 acres (estimated) identified as high-density anomaly areas that are associated with sensitively fuzed munitions types would be excavated and sifted to remove subsurface metallic clutter and possibly MEC. This would result in significant impacts to the natural resources. The areas that would be sifted would likely require active restoration (planting) and all portions of the site would be monitored as required by the HMP and biological opinions to ensure the habitat recovers consistent with the success criteria.

Overall Protection of the Environment

Prescribed burning (including preparation of temporary fuel breaks), surface MEC removals, and subsurface MEC removals (detection and investigation of individual anomalies) would be performed in a manner that is protective of the environment as described above under Alternatives 2 and 3.

Based on a review of currently available MEC-related data, an estimated total of approximately 85 acres could contain significant amounts of MEC and/or metallic debris involving sensitively fuzed munitions types. These areas are candidates for subsurface removal under this alternative and are anticipated to require large-scale excavations to remove the MEC in the subsurface, including sifting the top 2-foot layer of soil. For this portion of the Impact Area MRA, as described above under Alternative 3, excavation and sifting would cause significant temporary impacts and loss of listed species, seedbank, or critical habitat for species such as the California tiger salamander, California goldfields, and Monterey spineflower, sand gilia, and seaside bird's beak. The HMP and additional requirements currently limit the amount of temporary habitat destruction to 75 acres. It should be noted that the acreages attributed for sifting are estimates; the actual number of acres of habitat that would be temporarily disturbed by excavation and sifting could be more or less depending on site conditions. The estimated 85 acres of sifting under this alternative would be conducted in several small areas over the entire period of the cleanup so that temporary habitat disturbance can be managed within the HMP allowance at any given time. Depending on the actual size of these large-scale excavations, the need for re-initiating formal consultation with the USFWS in accordance with the requirements of the ESA would be assessed and implemented as necessary.

5.1.2 Compliance with ARARs

Alternative 1: No Further Action—This alternative could not be implemented in compliance with all ARARs listed in Table 1. If MEC were not removed from the Impact Area MRA, management of habitat reserve under the HMP and additional requirements listed in Table 1 could not be fully implemented.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls—This alternative would be implemented in compliance with the ARARs listed in Table 1.

Alternative 3: Subsurface MEC Remediation and Land Use Controls—This alternative could not be implemented in compliance with all ARARs listed in Table 1. Subsurface MEC removals in the portion of the Impact Area MRA where high anomaly density areas are present (estimated to be approximately 320 acres) could not be implemented in a manner that complies with the ARARs listed in Table 1 under the HMP and additional requirements; it would be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act. Subsurface MEC removals in the remainder of the Impact Area MRA would be implemented in compliance with the ARARs listed in Table 1.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls—This alternative would be implemented in compliance with the ARARs listed in Table 1 for technology-aided surface MEC removal and subsurface MEC removal. As described above, excavation and sifting of high-density anomaly areas is anticipated in approximately 85 acres. The estimated 85 acres of sifting would be conducted in several small areas over the entire period of the cleanup so that temporary habitat disturbance can be managed within the HMP allowance of 75 acres at any given time. Depending on the actual size of these large-scale excavations, it may be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act.

5.1.3 Short-Term Effectiveness

Alternative 1: No Further Action—This alternative would be effective in the short term related to MEC because no further action would be taken to mitigate MEC risks, so there would be no immediate impacts to workers or the adjacent community. Existing property management would not be continued (e.g., maintain perimeter fence, conduct minimum habitat management requirements such as invasive weed and erosion control). This alternative would not be effective in the short term related to the environment, because it would not allow for timely implementation of the full scope of habitat management to be implemented under the HMP and additional requirements due to the presence of MEC remaining onsite.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls—This alternative would be effective in the short term for surface MEC removal in each 800-acre per year phased implementation that would allow for timely implementation of MEC removals and the full scope of habitat management to be implemented under the HMP and additional requirements. Prescribed burns may cause some smoke impacts to the community, which are expected to be temporary. Community notification and smoke management would minimize potential impacts from smoke. Workers, the adjacent community, and the environment would be protected during implementation of prescribed burning, MEC removal, habitat management, and land use controls.

Alternative 3: Subsurface MEC Remediation and Land Use Controls—This alternative would be effective in the short term for subsurface MEC removals in each 300-acre per year phased implementation that would allow for timely implementation of MEC removals and the full scope of habitat management

to be implemented under the HMP and additional requirements. Prescribed burns may cause some smoke impacts to the community, which are expected to be temporary. Community notification and smoke management would minimize potential impacts from smoke. Workers, the adjacent community, and the environment would be protected during implementation of prescribed burning, MEC removal, habitat management, and land use controls. However, in portions of the Impact Area MRA where high density anomalies are present and require excavation and sifting, there would be significant short-term impacts to the environment due to habitat destruction in order to address MEC risks. Depending on the extent of implementation in these areas during each phase of implementation and over the long term, short term impacts would need to be assessed, and would require restoration, corrective actions, and re-initiating formal consultation with the USFWS.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls—This alternative would be effective in the short term for each 800-acre per year phased implementation as described above under Alternatives 2 and 3. Prescribed burns may cause some smoke impacts to the community, which are expected to be temporary. Community notification and smoke management would minimize potential impacts from smoke. Workers, the adjacent community, and the environment would be protected during implementation of prescribed burning, MEC removal, and land use controls. However, in portions of the Impact Area MRA where high density anomalies are present and require excavation and sifting, there would be significant short-term impacts to the environment in order to address MEC risks. Depending on the extent of implementation in these areas during each phase of implementation and over the long term, short term impacts would need to be assessed, and may require restoration, corrective actions, and re-initiating formal consultation with the USFWS.

5.1.4 Long-Term Effectiveness and Permanence

Alternative 1: No Further Action—This alternative would not provide long-term effectiveness or permanence regarding mitigation of potential MEC risks, because no further action would be taken to mitigate potential MEC risks to receptors assumed in the RA to reuse the area. In addition, this alternative is not anticipated to have long-term effectiveness and permanence in regards to the environment, because it would not allow for implementation of the full scope of habitat management and monitoring under the HMP and additional requirements.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls—This alternative would provide long-term effectiveness and permanence regarding mitigation of potential MEC risks on the surface, because all MEC detected on the surface of the Impact Area MRA would be removed, a digital map of remaining anomalies would be available to the future land owner to assist in making land management decisions, and Land Use Controls would be implemented to mitigate risks from potentially remaining MEC to receptors assumed in the RA to reuse the area. However, because subsurface MEC would not be removed, potential exists for MEC items to be exposed to the surface over the long-term, which would be addressed via the remedial Land Use Controls.

Land Use Controls would be required to support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management) and allow for proper management of the habitat reserve as described in the HMP and additional requirements. After remedial actions to address potential MEC risks at the Impact Area MRA have been conducted, residual After Action MEC Risks may be re-evaluated using site-specific MEC removal data, which, along with the digital geophysical mapping information, would be considered in verifying the appropriateness of remedial Land Use Control components. In addition, this alternative is anticipated to have long-term effectiveness and permanence regarding the environment because it would allow for implementation of the full scope of

habitat management and monitoring under the HMP and additional requirements. Post-remediation habitat monitoring would be conducted in accordance with HMP requirements to monitor the recovery of the habitat.

Alternative 3: Subsurface MEC Remediation and Land Use Controls—This alternative would provide long-term effectiveness and permanence regarding mitigation of potential MEC risks, because all MEC detected on the surface and in the subsurface of the Impact Area MRA would be removed using the best appropriate technology, a digital map of remaining anomalies would be available to the future land owner to assist in making land management decisions, and Land Use Controls would be implemented to mitigate potentially remaining MEC risks to receptors assumed in the RA to reuse the area. However, because MEC may potentially remain onsite, long term Land Use Controls would be required to support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management) and allow for proper management of the habitat reserve as described in the HMP and additional requirements. After remedial actions to address potential MEC risks at the Impact Area MRA have been conducted, residual After Action MEC Risks may be re-evaluated using site-specific MEC removal data, which, along with the digital geophysical mapping information, would be considered in verifying the appropriateness of remedial Land Use Control selected for implementation components. In addition, this alternative is anticipated to have long-term effectiveness and permanence regarding the environment for the majority of the Impact Area MRA because it would allow for implementation of the full scope of habitat management and monitoring under the HMP and additional requirements. Post-remediation habitat monitoring would be conducted in accordance with HMP requirements to monitor the recovery of the habitat. However, in the approximate 320-acre portion of the Impact Area MRA where high density anomalies are estimated to be present and require excavation and sifting, there could be significant long term impacts to the environment. Depending on the extent of implementation and recovery in each area during each phase of implementation, long-term impacts would need to be assessed, and would require restoration, corrective actions, and re-initiating formal consultation with the USFWS.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation, and Land Use Controls—This alternative would provide long-term effectiveness and permanence regarding mitigation of potential MEC risks on the surface and limited areas of the subsurface, because all MEC detected on the surface of the Impact Area MRA would be removed, and subsurface MEC would be removed from selected areas where greater risk reduction would further support the reuse, including fuel breaks and roads, a buffer along the habitat-side of the development border, and other limited areas. The potential for MEC to be exposed on the surface over the long-term due to changes in site conditions (e.g., erosion) would be addressed by follow up site monitoring. Land Use Controls would be required to support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management) and allow for proper management of the habitat reserve as described in the HMP and additional requirements.

The Land Use Controls include UXO-Qualified personnel support, access management support and helicopter support in some cases, to further support safe reuse activities by the future land owner. After remedial actions to address potential MEC risks at the Impact Area MRA have been conducted, residual After Action MEC Risks may be re-evaluated using site-specific MEC removal data, which, along with the digital geophysical mapping information, would be considered in verifying the appropriateness of Land Use Controls selected for implementation. In addition, this alternative is anticipated to have long-term effectiveness and permanence regarding the environment for the majority of the Impact Area MRA because it would allow for implementation of the full scope of habitat management and monitoring under the HMP and additional requirements. A digital map of remaining anomalies would be provided to the future landowner at the conclusion of the cleanup to assist the future landowner in their land management decisions. Post-remediation habitat monitoring would be conducted in accordance with HMP

requirements to monitor the recovery of the habitat. In the approximate 85-acre portion of the Impact Area MRA where high density anomalies are present and could require excavation and sifting, there could be significant long-term impacts to the environment. However, the acreages attributed for sifting are estimates; the actual number of acres of habitat that would be temporarily disturbed by excavation and sifting could be more or less depending on site conditions. In addition, temporary habitat impacts would be managed to be within the HMP allowance at any given time, and habitat restoration and monitoring would promote habitat recovery. Depending on the extent of implementation and recovery in each area during each phase of implementation, long term impacts would need to be assessed, and may require restoration, corrective actions, and re-initiating formal consultation with the USFWS.

5.1.5 Reduction of Toxicity, Mobility, or Volume Through Treatment

This RI/FS addresses only the physical hazards to humans from MEC. The chemical hazards are being addressed under the Basewide Range Assessment (BRA) program (*Shaw/MACTEC, 2006*) and Site 39 Ranges Feasibility Study (*MACTEC, 2007*).

Alternative 1: No Further Action—This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of MEC in the Impact Area MRA.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls—This alternative would provide significant reduction of these parameters through treatment because all MEC detected on the surface of the Impact Area MRA would be removed.

Alternative 3: Subsurface MEC Remediation and Land Use Controls—This alternative would provide the greatest reduction of these parameters through treatment because all MEC detected on the surface and in the subsurface of the Impact Area MRA would be removed.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls—This alternative would provide significant reduction of these parameters through treatment because all MEC detected on the surface of the Impact Area MRA would be removed, and MEC detected in the subsurface would be removed in selected areas of the Impact Area MRA where greater risk reduction would further support the reuse.

5.1.6 Implementability

Alternative 1: No Further Action—This alternative would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate potential MEC risks to reusers assumed in the RA are not expected. This alternative would be technically easy to implement (since taking no further action), however it would not comply with ARARs.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls—This alternative would be administratively feasible to implement, because the necessary approvals to implement surface MEC removals to reduce potential MEC risks for planned reuses could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance via prescribed burning prior to implementation of MEC removal, and (2) involves UXO-Qualified Personnel teams conducting MEC removals, and managing and reporting MEC-related data. Prescribed burning of up to 800 acres per year would require significant coordination and level of effort, and would be moderately difficult to implement due to the many

components involved in conducting a prescribed burn as follows: (1) Preparation of a burn prescription/burn plan outlining the objectives of the burn, the burn area, and the range of environmental conditions (temperature, humidity, wind speed/direction, fuel load, and fuel moisture) under which the burn will be conducted; (2) site preparation, including establishment and maintenance of containment lines, staging areas, and escape routes in accordance with the burn plan; (3) identifying the optimum weather conditions in order to conduct the burns within the window of environmental conditions established in the burn prescription; and (4) conducting follow-up operations to ensure that the fire is fully contained and does not escape the perimeter of the burn area. A site-specific work plan will be prepared prior to each phase of work, and would include a burn plan and community notification program. In addition, after MEC remediation is completed, Land Use Controls are expected to be easy to implement during reuse to protect human health.

Alternative 3: Subsurface MEC Remediation and Land Use Controls—This alternative would be administratively feasible to implement, because the necessary approvals to implement surface and subsurface MEC removals to reduce potential MEC risks for planned reuses could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require an extremely high level of effort to implement from a technical perspective, because it (1) would require vegetation clearance via prescribed burning prior to implementation of MEC removal; (2) involves UXO-Qualified Personnel teams conducting subsurface MEC removals via intrusive investigation of anomalies, and managing and reporting MEC-related data. Subsurface MEC removals require a much higher level of effort than surface MEC removals to investigate and resolve each anomaly detected below the surface. Prescribed burning of up to 300 acres per year would require significant coordination and level of effort as described under Alternative 2; however, it would be conducted on fewer acres per year, so is anticipated to be somewhat easier to implement from this perspective than described under Alternative 2 in terms of level of effort. In addition, after MEC remediation is completed, Land Use Controls are expected to be easy to implement during reuse to protect human health. From an administrative perspective, this alternative would be difficult to implement in the approximate 320-acre portion of the Impact Area MRA where high density anomalies are assumed to be present and require excavation and sifting. There would be significant long-term impacts to the environment in this area that would need to be assessed, and consulted on with the USFWS. The impacts would require long-term habitat restoration, monitoring, and reporting to ensure corrective actions were successful.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls—This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals in selected areas (e.g., fuel breaks, roads) could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require an extremely high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance via prescribed burning prior to implementation of MEC removal, and (2) involves UXO-Qualified Personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data. Prescribed burning of up to 800 acres per year would require significant coordination and level of effort as described above under Alternative 2. In addition, after MEC remediation is completed, Land Use Controls are expected to be easy to implement during reuse to protect human health. From an administrative perspective, this alternative would be moderately difficult to implement in the approximate 85-acre portion of the Impact Area MRA where high density anomalies are assumed to be present and require excavation and sifting. There could be significant impacts to the environment. It should be noted the acreages attributed for sifting are estimates; the actual number of acres of habitat that would be temporarily disturbed by excavation and sifting could be more or less depending on site conditions.

Depending on the extent of implementation and recovery in each area during each phase of implementation, long term impacts would need to be assessed, in consultation with the USFWS. The impacts would require long-term habitat restoration, monitoring, and reporting to ensure corrective actions were successful.

5.1.7 Cost

Capital and LTM costs are estimated for each alternative based on quotes for labor, materials, and equipment necessary to implement the alternative. For LTM costs, the NPV is calculated over the expected period of years it will take to implement the alternative based on real discount rates (similar to interest rates) that vary according to the period of performance for federal projects. USACE/EPA provide guidelines for estimating remedial alternative costs in OSWER Directive 9355.0-75 (January 2007; updated yearly), OMB, Executive Office of the President, Appendix C. The guidelines for federal projects are applied to cost estimates provided by Army/USACE contractors for the alternatives. These cost estimates are intended to have an accuracy of +50 percent/-30 percent. For those alternatives whose life-cycle is indeterminate or exceeds 30 years, for the purposes of evaluating and comparing alternatives as specified in EPA's RI/FS Guidance (EPA, 1989), a period of 30 years is used for estimating LTM costs.

Cost estimating assumptions, unit costs, and real discount rates (that vary according to the period of performance) that are associated with implementation of the remedial alternatives are provided in Appendix A. Estimated costs for each of the alternatives evaluated are summarized in Table 3.

Long Term Management Measures (property transfer restrictions, annual monitoring, five-year review reporting) will be implemented at the Impact Area MRA as implementation and management aspects of the selected remedy. The costs associated with implementing these measures for the entire Impact Area MRA over a period of 30 years are estimated at approximately \$453,000 (\$22,000 in Capital Costs and \$431,000 in annual costs). Cost estimates for these measures and assumptions are provided in Appendix A, Table A-2.

Cost estimates associated with implementation of the remedial alternatives are presented in Appendix A, Tables A-3 through A-5, and are summarized as follows.

Alternative 1: No Further Action—There are no costs associated with implementation of this alternative.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls—Cost estimates and assumptions for this alternative are provided in Appendix A, Table A-3, and are estimated as follows:

- **Total Cost**: \$88.90 million over a period of 30 years assumed for costing purposes.
- **Capital Cost (Year 1)**: \$8.88 million associated with the phased implementation of 800 acres per year prescribed burning, MEC removal, and reporting.
- **Annual Costs (Years 1 to 30)**: \$80.02 million associated with the phased implementation of 800 acres per year prescribed burning, MEC removal, habitat management, reporting, and Land Use Controls.

Alternative 3: Subsurface MEC Remediation and Land Use Controls—Cost estimates and assumptions for this alternative are provided in Appendix A, Table A-4, and are estimated as follows:

- **Total Cost:** \$423.17 million over a period of 30 years assumed for costing purposes.
- **Capital Cost (Year 1):** \$23.41 million associated with the phased implementation of 300 acres per year prescribed burning, MEC removal, and reporting.
- **Annual Costs (Years 1 to 30):** \$399.76 million associated with the phased implementation of 300 acres per year prescribed burning, MEC removal, sifting and restoration of approximately 320 acres of high-density anomaly areas, habitat management, reporting, and Land Use Controls.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls—Cost estimates and assumptions for this alternative are provided in Appendix A, Table A-5, and are estimated as follows:

- **Total Cost:** \$138.41 million over a period of 30 years assumed for costing purposes.
- **Capital Cost (Year 1):** \$15.38 million associated with the phased implementation of 800 acres per year prescribed burning, MEC removal, and reporting.
- **Annual Costs (Years 1 to 30):** \$123.03 million associated with the phased implementation of 800 acres per year prescribed burning, MEC removal, sifting and restoration of approximately 85 acres of high-density anomaly areas that are associated with sensitively fuzed munitions types, habitat management, reporting, and Land Use Controls.

5.1.8 State Acceptance

State acceptance will be addressed in the Impact Area MRA RI/FS ROD once comments on the RI/FS report and Proposed Plan have been received. Anticipated acceptability of the remedial alternatives are described as follows:

Alternative 1: No Further Action—This alternative is not likely to be acceptable to the regulatory agencies because it would not be protective of human health, as it does not take action to mitigate potential MEC risks to workers assumed in the RA to reuse the Impact Area MRA during habitat management activities under the HMP and additional requirements. In addition, it would not be protective of the environment or comply with ARARs.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls—This alternative is not anticipated to be acceptable to the regulatory agencies because, although it takes action both in the short and long term to mitigate MEC risks, and also implements Land Use Controls to protect receptors that may conduct intrusive activities during planned reuses, thereby providing protection of human health, MEC present in the subsurface would not be removed under this alternative. It also would be protective of the environment because it would allow for habitat management activities required under the HMP and additional requirements. It is anticipated that regulatory agencies concerned with protection of human health would be supportive of removing all MEC in the subsurface as well to reduce potential MEC risks in the long term; however, Land Use Controls that provide additional protection for future users due to the presence of subsurface MEC would be implemented. It is anticipated that regulatory agencies concerned with protection of the environment would be supportive of this alternative, because it

would not involve excavation of MEC during subsurface removals that could have significant impacts on biological resources protected under the ESA, HMP and other requirements.

Alternative 3: Subsurface MEC Remediation and Land Use Controls—This alternative is likely to be acceptable to the regulatory agencies because it takes action both in the short and long term to mitigate MEC risks, and also implements Land Use Controls to protect receptors that may conduct intrusive activities during planned reuses, thereby providing protection of human health. It also would be protective of the environment for the majority of the Impact Area MRA because it would allow for habitat management activities required under the HMP and additional requirements. However, for the approximate 320-acre portion of the Impact Area MRA where high density anomalies are present that would require excavation and sifting with significant habitat destruction, it would not be protective of the environment or comply with ARARs. It is anticipated that regulatory agencies concerned with protection of human health would be supportive of removing all MEC in the subsurface to reduce potential MEC risks in the long term. It is anticipated that regulatory agencies concerned with protection of the environment would not be supportive of this alternative, because it would have significant impacts on biological resources protected under the ESA, HMP and other requirements.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls—This alternative is likely to be acceptable to the regulatory agencies because it takes action both in the short and long term to mitigate MEC risks, as well as Land Use Controls to protect receptors during planned reuses, thereby providing protection of human health. It also would be protective of the environment because it would allow for habitat management activities required under the HMP and additional requirements. It is anticipated that regulatory agencies concerned with protection of human health would be supportive of this alternative because it removes all MEC from the surface, and in specific areas from the subsurface to reduce MEC risks in the long term. It is anticipated that regulatory agencies concerned with protection of the environment would be supportive of this alternative, because it minimizes the disturbance due to subsurface MEC removals, including large scale excavations, on biological resources protected under the ESA, HMP and other requirements.

5.1.9 Community Acceptance

Community acceptance will be addressed in the Impact Area MRA RI/FS ROD once comments on the RI/FS report and Proposed Plan have been received. Anticipated acceptability of the remedial alternatives are described as follows:

Alternative 1: No Further Action—This alternative is not likely to be acceptable to the public and other stakeholders because it does not take action to mitigate MEC risks onsite, nor to mitigate risks to workers assumed in the RA to reuse the Impact Area MRA during habitat management activities required under the HMP and additional requirements.

Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls—This alternative may be acceptable to the public and other stakeholders because it takes action both in the short and long term to mitigate MEC risks by removing MEC, and also implementing Land Use Controls to protect receptors during planned reuses, thereby providing protection of human health. It also would be protective of the environment because it would allow for habitat management activities required under the HMP and additional requirements. It is anticipated that some community members would have concerns regarding potential impacts to the public associated with prescribed burning, and the presence of MEC in the subsurface that would not be removed under this alternative. However, it is anticipated that other community members would be supportive of this alternative because it removes all MEC from the surface and allows for reuse as habitat reserve.

Alternative 3: Subsurface MEC Remediation and Land Use Controls—This alternative may be acceptable to the public and other stakeholders because it takes action both in the short and long term to mitigate MEC risks by removing MEC, and also implementing Land Use Controls to protect receptors during planned reuses, thereby providing protection of human health. It also would be protective of the environment in the long term, because it would allow for habitat management activities required under the HMP and additional requirements. It is anticipated that some community members would have concerns regarding potential impacts to the public associated with prescribed burning under this alternative. However, it is anticipated that other community members would be supportive of this alternative because it removes all MEC from the surface and subsurface and allows for reuse as habitat reserve.

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls—This alternative may be acceptable to the public and other stakeholders because it takes action both in the short and long term to mitigate MEC risks by removing MEC, as well as implementing Land Use Controls to protect receptors during planned reuses, thereby providing protection of human health. It also would be protective of the environment because it would allow for habitat management activities required under the HMP and additional requirements. It is anticipated that some community members would have concerns regarding potential impacts to the public associated with prescribed burning, and the presence of MEC in the subsurface that would not be removed under this alternative except in limited areas. However, it is anticipated that other community members would be supportive of this alternative because it removes all MEC from the surface and portions of the subsurface and allows for reuse as habitat reserve.

5.2 Comparison of Remedial Alternatives

The four remedial alternatives evaluated above for the Impact Area MRA are compared below based on their ability to achieve the nine evaluation criteria specified in the EPA's RI/FS Guidance (*EPA, 1989*).

5.2.1 Overall Protection of Human Health and the Environment

5.2.1.1 Overall Protection of Human Health

Alternative 1 would not be protective of human health because it takes no action to address the known presence of MEC or potential MEC risks posed to the receptors assumed in the RA to reuse the Impact Area MRA, and would not allow for safe access to perform required habitat management procedures protective of the environment. Alternatives 2, 3, and 4 would all be protective of human health for the receptors assumed in the RA to reuse the Impact Area MRA in combination with Land Use Controls. Alternative 3 would provide the greatest level of protection for human health because it would remove all MEC on the surface and subsurface, thereby mitigating potential MEC risks to reusers to the greatest degree. However, because there is a potential for MEC to remain onsite regardless of the level of removal, Land Use Controls would be included with all three alternatives to provide an equivalent level of protection for each alternative to (1) support safe reuse activities (e.g., habitat monitoring, invasive weed control, prescribed burning, and associated fire management); and (2) allow for proper management of the habitat reserve as described in the HMP and additional requirements.

5.2.1.2 Overall Protection of the Environment

Natural Resources Impacts

Alternative 1 would not allow for the habitat to be managed as required by the HMP and Biological Opinions. This would result in a change to the age structure of the CMC habitat, which would no longer

have a mosaic of many different age classes but rather an older senescent stand of CMC which would not support the diversity of plants and animals currently inhabiting the Impact Area MRA. In addition, the CMC would continue to grow to a point that would pose a significant fuel load that would increase the threat of a wildfire.

Alternative 2 would have the least impact on the significant natural resources found on the site. The habitat would be monitored as required by the HMP and biological opinions to ensure the habitat recovers consistent with the success criteria identified. There are fewer impacts to natural resources expected under this alternative since no excavations would occur.

Alternative 3 would result in significant impacts to the natural resources and would likely take decades to recover. The areas that would be sifted would likely require active restoration (planting) and all portions of the site would be monitored as required by the HMP and biological opinions to ensure the habitat recovers consistent with the success criteria identified. This alternative would result in the most significant impacts to natural resources compared to the other alternatives.

Alternative 4 would also result in minimal impacts to the significant natural resources found on the site. Subsurface MEC removal would be implemented in selected areas of the Impact Area MRA where greater risk reduction would further facilitate reuse of the area as a habitat reserve. The subsurface MEC removal areas would include a 100-foot buffer along the habitat side of the development interface, permanent fuel breaks and access roads, and other areas as required by the future landowner to support their reuse (e.g., habitat restoration, additional fuel breaks, etc.). Following completion of this alternative the land would be able to be managed as identified by the HMP, biological opinions, HCP, and other supporting documents.

Overall Protection of the Environment

Alternative 1 would not be protective of the environment in the long term because all HMP and other requirements for management of the habitat such as prescribed burning and monitoring could not be implemented under this alternative. Therefore, this alternative would not comply with special requirements as described in the HMP and additional requirements.

Alternatives 2, 3, and 4 would all be protective of the environment for the majority of the Impact Area MRA where high anomaly density areas are not present. Prescribed burning, surface MEC removals, and subsurface MEC removals would be performed using methods that would comply with HMP and additional requirements incorporating reasonable and prudent measures to avoid or mitigate impacts to listed species or critical habitat for species such as the California tiger salamander, California goldfields, and Monterey spineflower, sand gilia and seaside bird's beak. Prescribed burning, surface MEC removals, and subsurface MEC removals have been conducted in other areas at the former Fort Ord in accordance with these requirements without significant adverse impacts to biological resources based on habitat monitoring results. In addition, post-remediation habitat monitoring would continue to be conducted in accordance with the Vegetation Monitoring Plan and Wetland Monitoring and Restoration Plan for (1) HMP annual plants, (2) HMP shrubs, and (3) wetland species (*Burleson, 2006, 2007*). Results of monitoring would be documented in annual reports submitted to the USFWS and CDFG.

Alternative 3 is anticipated to have the most significant impacts to the environment due to the approximately 320 acres containing high-density anomalies that are anticipated to require large-scale excavations to remove the MEC in the subsurface, including sifting the top 2-foot layer of soil. For this portion of the Impact Area MRA, excavation and sifting of high anomaly density areas would cause significant impacts that exceed the current 75-acre limit in the HMP. Alternative 4 is also anticipated to

include subsurface MEC removal on up to 85 acres anticipated to require excavation and sifting, in areas where high density anomaly is present and are associated with sensitive munitions types. However, for this alternative the 85 acres is close to the 75-acre limit and: (1) is an estimate that would be confirmed during implementation when access to these areas is available after prescribed burning is conducted to clear vegetation; (2) does not significantly exceed the 75 acre limit; and (3) subsurface MEC removals in the 85 acres would not be conducted all at once, but would be implemented in different areas in phases of smaller acreages, allowing for management and monitoring of the need for potential restoration measures, corrective actions, and re-initiating formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act to be assessed and implemented as necessary.

5.2.2 Compliance with ARARs

Alternative 1 could not be implemented in compliance with all ARARs listed in Table 1. If MEC were not removed from the Impact Area MRA, management of habitat reserve under the HMP and additional requirements listed in Table 1 could not be implemented. Alternative 2 would be implemented in compliance with ARARs. Alternative 3 could not be implemented in compliance with all ARARs listed in Table 1. Subsurface MEC removals in the portion of the Impact Area MRA where high anomaly density areas are present (320 acres) could not be implemented in a manner that complies with the HMP and additional requirements. It would be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act. Subsurface MEC removals in the remainder of the Impact Area MRA would be implemented in compliance with the ARARs listed in Table 1. Alternative 4 would be implemented in compliance with ARARs. However, as described above, depending on the actual extent of excavation and sifting of the high-density anomaly areas associated with sensitive type munitions (estimated to be approximately 85 acres), it may be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the ESA.

5.2.3 Short-Term Effectiveness

Alternative 1 would be effective in the short term regarding workers and the community because no further action would be taken to mitigate MEC risks, so there would be no potential immediate impacts regarding MEC. Alternatives 2, 3, and 4 would all be effective in the short term regarding mitigation of MEC risks for each 300- or 800-acre per year phased implementation. Prescribed burns may cause some smoke impacts to the community, which are expected to be temporary. Community notification and smoke management would minimize potential impacts from smoke. Workers and the community would be protected during implementation of prescribed burning, MEC removal, and land use controls via safety protocols that will be described in the implementation work plan. Regarding the environment, Alternatives 3 and 4 would have significant impacts on the environment for the portions of the Impact Area MRA where high density anomalies would require excavation and sifting that would require mitigation.

5.2.4 Long-Term Effectiveness and Permanence

Alternative 1 would not provide long-term effectiveness or permanence because no further action would be taken. Alternatives 2, 3, and 4 would all provide long-term effectiveness and permanence during reuse because all MEC detected on the surface and portions or all of the subsurface MEC in the Impact Area MRA would be removed using the best appropriate technology, and land use controls would be implemented to mitigate remaining MEC risks during reuse. Although the risk assessment did not show a significant difference in overall risk reduction between these alternatives, Alternative 3 would provide a greater degree of long-term effectiveness and permanence because it is assumed to remove all MEC

detected on the surface and in the subsurface. Alternative 4 would provide for subsurface MEC removal in selected areas where greater risk reduction would further facilitate reuse of the area as a habitat reserve. After remedial actions to address potential MEC risks at the Impact Area MRA have been conducted, residual After Action MEC Risks may be re-evaluated using site-specific MEC removal data, which, along with the digital geophysical mapping information, would be considered in verifying the appropriateness of the remedial Land Use Control components. Regarding the environment, Alternative 3 would have the most significant long-term impacts, and Alternative 4 may have significant long-term impacts on the environment for the portions of the Impact Area MRA where high density anomalies would require excavation and sifting that would require mitigation.

5.2.5 Reduction of Toxicity, Mobility, or Volume Through Treatment

Alternative 1 would not provide reduction of these parameters through treatment because no further action would be taken to remove MEC within the Impact Area MRA. Alternatives 2, 3, and 4 would all provide varying degrees of reduction of these parameters through treatment. Under Alternatives 2 and 4, all MEC detected on the surface would be removed. Under Alternative 4, subsurface MEC would be removed from within selected areas (approximately 10 percent) of the Impact Area MRA. Alternative 3 would provide the greatest reduction of these parameters through treatment because it would remove all MEC detected on the surface and in the subsurface.

5.2.6 Implementability

Alternative 1 would not be administratively feasible to implement because the necessary approvals to (1) take no further action to mitigate the MEC risks, and (2) allow for management of habitat reserve under the HMP and additional requirements, are not expected. Alternatives 2, 3, and 4 would all be implementable from a technical perspective, because the necessary approvals to (1) implement MEC removals to reduce potential MEC risks for planned reuses; and (2) allow for management of habitat reserve under the HMP and additional requirements, could be obtained. The necessary services, equipment, and skilled workers to implement these alternatives are also readily available. However, Alternative 3 would require the highest level of effort to implement from a technical perspective, because it involves subsurface investigation of all anomalies throughout the Impact Area MRA. Alternatives 2, 3, and 4 would all require significant coordination and level of effort to implement prescribed burning prior to MEC removals as follows: (1) Preparation of a burn prescription/burn plan outlining the objectives of the burn, the burn area, and the range of environmental conditions (temperature, humidity, wind speed/direction, fuel load, and fuel moisture) under which the burn will be conducted; (2) site preparation, including establishment and maintenance of containment lines, staging areas, and escape routes in accordance with the burn plan; (3) identifying the optimum weather conditions for conducting the burn within the window of environmental conditions established in the burn prescription; and (4) conducting follow-up operations to ensure that the fire is fully contained and does not escape the perimeter of the burn area.

In addition, after MEC remediation is completed under Alternatives 2, 3, and 4, After Action MEC risks may be re-evaluated using site-specific MEC removal data, which, in addition to the digital geophysical mapping information, would be considered in verifying the appropriateness of the remedial Land Use Control components. Determining and implementing appropriate Land Use Controls and habitat monitoring are expected to be easy to implement to protect human health during reuse.

5.2.7 Cost

Table 3 and Appendix A, Table A-1 summarize the estimated costs associated with implementation of the four remedial alternatives. The No Further Action Alternative has no costs associated with its implementation, but it takes no long-term action to mitigate the MEC risks, and would not allow for management of habitat reserve under the HMP and additional requirements. Of the three MEC remediation alternatives, Alternative 2 has the lowest total estimated cost associated with its implementation, of \$88.90 million. Alternative 3 has the highest total estimated cost associated with its implementation, of approximately \$423.17 million. Alternative 4 has a total estimated cost associated with implementation of approximately \$138.41 million, which is in between the total estimated costs for implementation of Alternatives 2 and 3. Cost estimates for these alternatives, and Long Term Management Measure costs of \$453,000 for the entire Impact Area MRA are provided in Appendix A, and are summarized on Table A-1; with costs for Long Term Management Measures and Alternatives 2 through 4 presented in Tables A-2 through A-5, respectively.

5.2.8 State Acceptance

State acceptance will be addressed in the Impact Area MRA RI/FS ROD once comments on the RI/FS report and Proposed Plan have been received. It is anticipated Alternative 1 would not be acceptable to the regulatory agencies because it takes no MEC remedial action to address MEC risks, and would not allow for habitat management under the HMP and other requirements. It is anticipated the regulatory agencies may not be supportive of Alternative 2 because it does not address the presence of MEC in the subsurface; however, they are anticipated to be supportive of Alternatives 3 and 4 depending on their concerns regarding varying components of each alternative in terms of its protectiveness of human health and/or the environment.

5.2.9 Community Acceptance

Community acceptance will be addressed in the Impact Area MRA RI/FS ROD once comments on the RI/FS report and Proposed Plan have been received. It is anticipated Alternative 1 would not be acceptable to the community because it takes no MEC remedial action to address MEC risks, and would not allow for habitat management under the HMP and other requirements. It is anticipated the community may be supportive of Alternatives 2, 3, and 4 depending on their concerns regarding varying components of each alternative in terms of its protectiveness of human health and/or the environment.

6.0 IDENTIFICATION OF THE PREFERRED REMEDIAL ALTERNATIVE

This section identifies the preferred remedial alternative that best meets the evaluation criteria for MEC remediation at the Impact Area MRA. Long Term Management Measures (i.e., property transfer documentation, annual monitoring, and five-year review reporting) associated with the implementation and management of the selected remedy for the Impact Area MRA are estimated to have a total cost over a period of 30 years of approximately \$453,000. Cost estimates for these measures are provided in Appendix A, Table A-2.

The four remedial alternatives evaluated and compared in Section 5.0 based on the nine CERCLA evaluation criteria specified in the EPA's RI/FS Guidance (EPA, 1989) for the Impact Area MRA include:

- Alternative 1: No Further Action
- Alternative 2: Technology-Aided Surface MEC Remediation and Land Use Controls
- Alternative 3: Subsurface MEC Remediation and Land Use Controls
- Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls.

Based on the evaluation and comparison of the four potential remedial alternatives, Alternative 4 is identified as the preferred remedial alternative for implementation at the Impact Area MRA. The main components of this alternative are summarized as follows:

Alternative 4: Technology-Aided Surface MEC Remediation, Subsurface MEC Remediation in Selected Areas, and Land Use Controls—This alternative includes Technology-Aided Surface MEC Remediation throughout the entire Impact Area MRA (with MEC detection instruments available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible), and Subsurface MEC Remediation in selected areas where greater risk reduction would further facilitate reuse of the area as a habitat reserve. Subsurface MEC remediation would be conducted in selected areas including (1) regularly maintained fuel breaks and access roads; (2) a buffer area along the habitat-side of the development border of the Impact Area MRA that would act as an additional safety zone and provide firefighters with the ability to fight wildfires from the border (minimum 100-ft width, may be expanded if site conditions warrant); and (3) other areas to address specific risk and/or reuse needs such as proposed, future land owner habitat restoration areas. For the purposes of this FS, subsurface MEC removals are assumed to be conducted in approximately 10 percent of the Impact Area MRA.

It is assumed prescribed burning (followed by MEC remedial action) would be implemented using a phased approach. Prescribed burns would be conducted in stages and consist of several smaller burns, approximately 100 acres in size (actual size could be more or less than 100 acres depending site-specific considerations), over several days, rather than one large burn. Prescribed burning and MEC remedial actions would be conducted in up to 800 acres of the 6,560-acre Impact Area MRA per year, for 8 years. In compliance with the HMP, no more than 800 acres would be prescribed burned in any given year.

The Technology-Aided Surface MEC Remediation and Subsurface MEC Remediation in Selected Areas Alternative would include the following components:

- Prescribed burning to clear vegetation and provide access to conduct MEC removals.

- Technology-Aided surface MEC removal throughout the entire Impact Area MRA, and detonation with engineering controls of any UXO identified; MEC detection instruments would be available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible; surface reconnaissance would be conducted annually following surface MEC remediation to identify and address erosion-prone areas, until re-growth of vegetation stabilizes the area.
- Subsurface MEC removal (intrusive investigation of all anomalies) on fuel breaks and roads essential to safe habitat management activities, a safety buffer along the habitat-side of the development boundary, and other selected areas where greater risk reduction would further support the reuse (such as proposed future land owner habitat restoration areas). For the purposes of this FS, subsurface MEC removal is assumed to be conducted in approximately 10 percent of the Impact Area MRA. Additional subsurface MEC removal areas would be identified in coordination with the agencies and the future land owner based on factors such as the feasibility of implementation, cost, and habitat management requirements. Based on a review of currently available MEC-related data, a total of approximately 85 acres of the Impact Area MRA could contain significant amounts of MEC and/or metallic debris involving sensitively fuzed munitions types. These areas are candidates for subsurface MEC removals, and the effort is assumed for the purpose of this FS to include excavation and sifting the top 2-foot layer of soil in order to make it safe for future reusers. Post-remediation habitat restoration and monitoring would be required in these areas.
- Digital mapping to provide a record of remaining anomalies and to assist future property users in identifying areas with specific MEC safety support requirements. Anomalies within the areas identified for subsurface MEC removal will be investigated or resolved; the digital map can be used by the future land owner to assist in land management decision making.
- Implementation of Land Use Controls including: MEC recognition and safety training, construction monitoring for intrusive activities, helicopter support for select HMP/HCP future land owner prescribed burns if warranted, access management measures including maintaining a perimeter fence and law enforcement support to prevent unauthorized access, and land transfer documentation outlining the prohibition of unrestricted land use and any other reuse restrictions or conditions; In addition to providing MEC recognition training and construction monitoring, the full-time onsite UXO-Qualified Personnel would be available to provide other UXO-Qualified Personnel support as needed to support reuse activities based on area-specific conditions and activities, such as surface reconnaissance of future prescribed-burned areas and activity planning.
- Post-remediation habitat monitoring within the areas of subsurface MEC removal or other disturbances such as mechanical clearance of vegetation (collecting data on HMP species and habitats, and perform mapping, data management and evaluation, and reporting), and habitat restoration in sifting areas.

After technology-aided surface MEC removals are completed for each phase of work described in the site-specific work plans, digital geophysical mapping would be conducted. Following the geophysical mapping the Army would review the data and prepare a Technical Memorandum to EPA and DTSC that would present an evaluation of the work completed to date and if necessary, describe additional subsurface removals recommended based on the results of the initial work. Factors that would be considered when determining whether additional actions are necessary include, but are not limited to: (1) type of MEC encountered and danger associated with MEC; (2) proximity to potential receptors; (3) density of items; and (4) consistency with ARARs such as the HMP and Biological Opinions. If no additional work is required this would also be documented in the Technical Memorandum along with the rationale for no further removal actions. Each Technical Memorandum would be an addendum to the

site-specific work plan, and therefore, would be associated with a primary document and be disputable. To avoid impacts to the rare, threatened and endangered species, completion and agency approval of the Technical Memorandum will be expedited to allow any additional actions to be executed before the next growing season. Each Technical Memorandum and associated correspondence would be made available to the public in the Administrative Record.

Additional information about Alternative 4 is provided in Section 4.4.4 of the FS. Alternative 4 is identified as the preferred remedial alternative because it best balances the reduction of MEC risks to human health and the resulting impacts to the significant natural resources, and meets the nine evaluation criteria specified in the EPA's RI/FS Guidance (EPA, 1989) as follows:

Threshold Criteria

(1) Overall Protection of Human Health and the Environment – Alternative 4 eliminates, reduces, and controls potential threats to public health through treatment (MEC removal) and institutional controls (Land Use Controls), offering the benefits of a complete surface MEC removal throughout the Impact Area MRA, as well as subsurface MEC removal in selected areas to support habitat management activities over the long term. This alternative would be protective of human health and the environment in conjunction with Land Use Controls. After remedial actions to address potential MEC risks at the Impact Area MRA have been conducted, residual After Action MEC Risks may be re-evaluated using site-specific MEC removal data, which, in addition to the digital geophysical mapping information, would be considered in verifying the appropriateness of remedial Land Use Controls selected for implementation. Impacts to the significant natural resources found on the site would be minimized during the implementation of this alternative. Subsurface MEC removal would be implemented in selected areas (approximately 10 percent) of the Impact Area MRA where greater risk reduction would further facilitate reuse of the area as a habitat reserve. The subsurface MEC removal areas would include a safety buffer on the habitat side of the development interface, permanent fuel breaks and access roads, and other areas as required by the future land owner to support their reuse (e.g. habitat restoration areas, etc.). Following completion of this alternative, in combination with remedial land use controls that include UXO-Qualified Personnel support, access management support and helicopter support in some cases, the land would be able to be managed as identified by the HMP, biological opinions, HCP, and other supporting documents. This alternative would provide protection of the environment at the Impact Area MRA because prescribed burning and MEC removal would be performed using methods that would comply with ARARs and special HMP requirements that apply to habitat reserve at the former Fort Ord. In addition, post-remediation habitat monitoring would be conducted in accordance with HMP requirements to monitor the recovery of the habitat after MEC remedial actions are implemented. Approximately 85 acres of high anomaly density associated with sensitive munitions types, anticipated for subsurface MEC removals via excavation and sifting, would have significant impacts on the habitat in these areas that would need to be mitigated in consultation with USFWS.

(2) Compliance with Applicable, Relevant and Appropriate Requirements (ARARs) – Alternative 4 would be conducted using methods that would comply with Federal and State environmental statutes, regulations, and other requirements that pertain to the remedial actions and site-specific conditions within the Impact Area MRA. However, approximately 85 acres of high anomaly density associated with sensitive munitions types, anticipated to require subsurface MEC removals via excavation and sifting would have significant impacts on the habitat in these areas that would need to be mitigated in consultation with USFWS.

Balancing Criteria

(3) Long-Term Effectiveness and Permanence – Although none of the alternatives would allow for unrestricted reuses, Alternative 4 would provide long-term effectiveness and permanence for planned reuses of the site and maintain protection of human health and the environment over time.

(4) Reduction of Toxicity, Mobility, or Volume Through Treatment – Alternative 4 would provide significant reduction of the toxicity, mobility, and volume of MEC through treatment (for which there is a statutory preference) to reduce the harmful effects of principal contaminants (MEC) on the surface of the Impact MRA and in selected areas in the subsurface as well that support safe reuse.

(5) Short-Term Effectiveness – Alternative 4 would require a moderate length of time and level of effort to implement (approximately 800 acres per year for a period of 8 years), and could be conducted while mitigating potential risks posed to workers, residents, and the environment during implementation. Prescribed burns may cause some smoke impacts to the community, which are expected to be temporary. Community notification and smoke management would minimize potential impacts from smoke.

(6) Implementability – Alternative 4 would be administratively feasible to implement, and the necessary approvals for its implementation are assumed to be easy to obtain. This alternative would also be technically feasible to implement as the services, necessary equipment, and skilled workers to implement this alternative are readily available. However, as with Alternatives 2 and 3, prescribed burning of up to 800 acres per year would require significant coordination and level of effort including suitable weather conditions.

(7) Cost – Total costs estimated for implementation of Alternative 4 are approximately \$138.4 million assuming a phased approach of conducting prescribed burning and MEC removals on a total of approximately 800 acres per year over an assumed period of 8 years for costing purposes (with an additional 5 years of habitat management, and 30 years of Land Use Controls), which is in between the total cost for Alternative 2 of \$88.9 million, and \$423.2 million for Alternative 3.

Modifying Criteria

(8) State Acceptance – State Acceptance will be addressed in the Impact Area MRA RI/FS ROD once comments on the RI/FS report and Proposed Plan have been received (*EPA, 1989*). It is anticipated the regulatory agencies would be supportive of Alternative 4 because it would address MEC risks and be protective, and best meet the evaluation criteria described above.

(9) Community Acceptance – Community Acceptance will be addressed in the Impact Area MRA RI/FS ROD once comments on the report and Proposed Plan have been received (*EPA, 1989*). It is anticipated the community would be supportive of Alternative 4 because it would best meet the evaluation criteria described above. However, some members of the community would have concerns regarding implementation of the prescribed burning component of this alternative.

7.0 APPROVAL PROCESS

The approval process for the Impact Area MRA RI/FS includes the following components:

- Prepare the RI/FS report with regulatory agency and public review of the Draft and Draft Final reports.
- Prepare a Proposed Plan that presents the Army's preferred alternative for the Impact Area MRA and summarizes the results of the RI, RA, and FS.
- Solicit public comments on the Proposed Plan during a 30-day public comment period.
- Provide an opportunity for a public meeting on the Proposed Plan where written and verbal comments can be submitted.
- Prepare the Record of Decision (ROD) that (1) summarizes the results of the RI, RA, and FS, (2) includes a Responsiveness Summary that summarizes any public comments received on the Proposed Plan, and Army responses to comments, and (3) specifies the details of the selected remedy(s), including plans for development and submittal of a Remedial Design/Remedial Action Work Plan (RD/RAWP). Under the FFA between the Army, EPA, and DTSC, a schedule for preparation of the RD/RAWP for the Impact Area MRA will be submitted within 21 days of signature of the ROD.
- Receive EPA approval of the ROD, and review by DTSC.
- Announce the decision regarding the remedy selection in a local major newspaper and place copies of the RI/FS, Proposed Plan, and ROD in the Administrative Record and local information repositories.

TABLES

**Table 1. Potential Applicable Or Relevant And Appropriate Requirements (ARARs)
Feasibility Study, Impact Area MRA RI/FS, Former Fort Ord, California**

Source or Authority	Requirement, Standard, or Criterion	Type	Description	Remarks
			Federal ARARs	
Endangered Species Act (16 USC §§ 1531–1543)	16 USC § 1536 (a) and (c); 16 USC § 1538 (a)(1)	Applicable (1,2,3)* / Location	Federal agencies are required under Section 7 of the ESA to ensure that their actions do not jeopardize the continued existence of a listed species or result in destruction of or adverse modification of its critical habitat (16 USC § 1536). If the proposed action may affect the listed species or its critical habitat, consultation with the USFWS and/or California Fish and Game may be required (50 CFR § 402.14). Additionally, Section 9 of the ESA prohibits the illegal taking of a listed species (16 USC § 1538(a)(1)).	The Army has completed an endangered species, Section 7 consultation, and the USFWS has issued several Biological Opinions for the Army disposal and reuse actions at the former Fort Ord. Endangered plant and animal species and critical habitats occur at Fort Ord. Each reuse area will be screened for potential impacts to any endangered species identified in the <i>Installation-Wide Multispecies Habitat Management Plan</i> (HMP; USACE, 1997) and additional requirements identified in subsequent documents (USACE, 2005; USFWS, 1999, 2002, 2005; BLM, Army; 2004; Zander, 2002). The provisions of the HMP and referenced additional requirements satisfy the requirements of the ESA.
Migratory Bird Treaty Act (MBTA)	16 U.S.C. §§703-712	Applicable (1,2,3) / Location	The statute sections prohibit the taking, possession of, buying, selling, purchasing, or bartering of any migratory bird, including feathers or other parts, nest eggs, or products, except as allowed by regulations.	The requirement includes specific standards of control. U.S. Fish and Wildlife Service has issued a non-jeopardy biological opinion for Army predisposal actions to include the remediation of MEC, which provides that vegetation clearance activities occur outside the nesting seasons for migratory birds.
Hazardous Materials & Transportation Act	49 CFR Part 172.101	Applicable (3) / Chemical and Action	These regulations impose procedures and controls on the transportation of hazardous materials.	The regulations include specific standards of control and substantive requirements, criteria and limitations that may apply to the transport of detonation materials and selected recyclable ordnance materials.
Federal Resource Conservation and Recovery Act (RCRA), Subpart M (Military Munitions Rule)	40 CFR Parts 266 and 270	Relevant and Appropriate (2, 3) / Chemical and Action	The regulations identify when military munitions on active ranges become subject to the regulatory definition of “solid waste”, for purposes of Subtitle C, and if these wastes are hazardous, the management standards which apply.	Portions of the Rule may be relevant and appropriate, but those provisions of the Rule which exclude military munitions from RCRA Subtitle C regulations are not appropriate to the remediation of a closed range. The relevant portions relate to the management of MEC which is recovered, including characterization as hazardous waste and requirements for treatment, storage, and transportation. The Rule provides for the storage and transportation of recovered military munitions in accordance with DDESB standards.

**Table 1. Potential Applicable Or Relevant And Appropriate Requirements (ARARs)
Feasibility Study, Impact Area MRA RI/FS, Former Fort Ord, California**

Source or Authority	Requirement, Standard, or Criterion	Type	Description	Remarks
			State of California ARARs	
California Endangered Species Act	Fish and Game Code §§ 2051 et seq.; §2080.	Relevant and Appropriate (1,2,3) / Location	The statute sections provide a declaration of policy and definitions. Section 2080 provides that no person shall take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the commission determines to be an endangered species or a threatened species, or attempt any of those acts.	Section 2080 includes specific standards of control with respect to the taking of endangered or threatened species. Under CERCLA, the Army is not required to comply with non-substantive, procedural and administrative provisions of §2051. The Army has coordinated the development of the HMP with CDFG and that mitigation measures to protect both State and federal rare, threatened and endangered species have been identified and will be implemented during the Army's action of MEC remediation if selected for implementation.
California Fish and Game Code	§3511	Relevant and Appropriate (1,2,3) / Location	This statute section prohibits taking or possessing fully protected birds or parts thereof, listed as: (a) American peregrine falcon (<i>Falco peregrinus anatum</i>) (b) Brown pelican (c) California black rail (<i>Laterallus jamaicensis coturniculus</i>) (d) California clapper rail (<i>Rallus longirostris obsoletus</i>) (e) California condor (<i>Gymnogyps californianus</i>) (f) California least tern (<i>Sterna albifrons browni</i>) (g) Golden eagle (h) Greater sandhill crane (<i>Grus canadensis tabida</i>) (i) Light-footed clapper rail (<i>Rallus longirostris levipes</i>) (j) Southern bald eagle (<i>Haliaeetus leucocephalus leucocephalus</i>) (k) Trumpeter swan (<i>Cygnus buccinator</i>) (l) White-tailed kite (<i>Elanus leucurus</i>) (m) Yuma clapper rail (<i>Rallus longirostris yumanensis</i>).	The requirement includes specific standards of control that may apply to the American peregrine falcon (some possibility), golden eagle (slight possibility), brown pelican (not likely but possible), and California least tern (not likely but possible). Vegetation clearance activities will occur outside the nesting seasons for these protected birds.
California Fish and Game Code	§3513	Relevant and Appropriate (1,2,3) / Location	This statute section declares that it is unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Treaty Act.	The requirement includes specific standards of control. U.S. Fish and Wildlife Service has issued a non-jeopardy biological opinion for Army predisposal actions to include the remediation of MEC. In addition, vegetation clearance activities will occur outside the nesting seasons for migratory birds.
California Fish and Game Code	§3503.5	Relevant and Appropriate (1,2,3) / Location	This statute section prohibits the take, possession or destruction of any birds in the orders of Falconiformes or Strigiformes, or to take, possess, or destroy the nest or eggs of any such bird, except as provided in the code.	The requirement includes specific standards of control that may apply to vultures, hawks, ospreys, falcons and owls. Vegetation clearance activities will occur outside the nesting seasons for these birds.
California Fish and Game Code	Title 14, CCR §472	Relevant and Appropriate (1,2,3) / Location	This regulation limits the taking of nongame birds and mammals except for specified species.	The requirement includes specific standards of control that may affect American crows. Vegetation clearance activities will occur outside the nesting seasons.
California Fish and Game Code	§4800 et. seq.	Relevant and Appropriate (1,2,3) / Location	This statute section declares that it is unlawful to take, injure, possess, transport or sell any mountain lion.	The requirement includes specific standards of control. Due to the size of vegetation clearance and MEC remediation activities that may be selected for implementation, it is unlikely that mountain lions will be negatively affected. In fact, the use of fire to set back plant community succession will result in an improvement to wildlife habitat that will benefit mountain lions.

**Table 1. Potential Applicable Or Relevant And Appropriate Requirements (ARARs)
Feasibility Study, Impact Area MRA RI/FS, Former Fort Ord, California**

Source or Authority	Requirement, Standard, or Criterion	Type	Description	Remarks
California Fish and Game Code	Title 14, CCR §§40-42	Relevant and Appropriate (1,2,3) / Location	These regulations make it unlawful to take, possess, purchase, propagate, sell, transport, import, or export any native reptile or amphibian, unless under special permit.	<p>The requirement includes specific standards of control that may apply to black legless lizard and coast horned lizard.</p> <p>CDFG was heavily involved in the development of the Installation-Wide Multispecies Habitat Management Plan (HMP), which included the development of mitigation measures to protect the California black legless lizard.</p>
California Clean Air Act (Health and Safety Code)	Monterey Bay Unified Air Pollution Control District Rule 438 (Open Outdoor Fires; <i>Adopted April 16, 2003; Revised September 15, 2004</i>)	Applicable (1) / Action	These prohibitory rules describe permit requirements, allowable days for burning, and restrictions. The rules include both substantive and procedural requirements regarding open burning.	<p>The rule includes specific standards of control. It also includes non-substantive procedural and administrative provisions with which the Army, under CERCLA, is not required to comply.</p> <p><u>Substantive requirements:</u></p> <p>§3.3, prohibiting burn on no-burn days. The Army will conduct prescribed burns on allowable days in accordance with CCR Title 17, §80110.</p> <p>§3.4.10, burn shall be ignited only by devices and methods approved by the California Department of Forestry and Fire Protection. The Army will use ignition devices approved by CDF.</p> <p>§3.4, materials to be burned shall be dry and reasonably free of dirt, soil and visible surface moisture prior to burning, and shall be free from combustible impurities such as tires, tar paper, household rubbish, demolition or construction debris, and other materials not grown at a site. The Army will comply with this section by removing tires, structures and other debris from the sites prior to conducting prescribed burns, where it is safe to do so. Numerous MEC items have been removed from the areas where accessible and where it was safe to do so. Emissions from incidental detonation of MEC during prescribed burning are expected to be insignificant, based on a study conducted by the Army, in consultation with EPA and DTSC (<i>Technical Memorandum, Air Emissions from Incidental Ordnance Detonation During a Prescribed Burn on Ranges 43 through 48 (Harding ESE, 2001)</i>). The study concluded that air pollutant emissions from incidental MEC detonation during a prescribed burn will be minor compared to emissions contributed directly from biomass burning, and will result in pollutant concentration well below health-protective regulatory screening levels.</p> <ul style="list-style-type: none"> The regulation is intended to protect the public health. The Army will substantively comply with this regulation by implementing the site preparation measures as described above, as well as conducting the burns in accordance with the smoke management program, and applying resources to contain the fire within the intended boundaries to minimize public exposure to smoke.

**Table 1. Potential Applicable Or Relevant And Appropriate Requirements (ARARs)
Feasibility Study, Impact Area MRA RI/FS, Former Fort Ord, California**

Source or Authority	Requirement, Standard, or Criterion	Type	Description	Remarks										
California Health and Safety Code, Division 20	Title 22, CCR Division 4.5	Applicable (3) / Chemical and Action	The statute and regulations provide for identification of hazardous waste in §§66261. If a material is a hazardous waste, Division 4.5 provisions further regulate hazardous waste generators, transporters, and treatment, storage, and disposal facilities.	The Army will evaluate discovered items in accordance with the approved work plan to determine the presence of energetic materials or other constituents that would cause it to be characterized as a hazardous waste. Substantive requirements: <ul style="list-style-type: none">Storage: onsite storage of MEC items occur in a designated bunker that meets the standard of DDESB 6055.9 STD, including security measures such as fences, signs, and an alarm system.Transportation: offsite transportation of small arms ammunition will incorporate applicable manifesting and placarding requirements. Conforms to Defense Reutilization and Marketing Office (DRMO) instruction.Disposal/recycling: offsite disposal or recycling facility or facilities for small arms ammunition will be state and/or RCRA-authorized.										
California Health and Safety Code	Title 22, CCR §66264.601-603	Relevant and appropriate (2) / Action	These regulations apply to hazardous waste treatment which is conducted in a device that does not meet the definition of a “container” in 22 CCR 66260.10 is characterized as a “Miscellaneous Unit” subject to the provisions of 22 CCR 66264.601-603. For activities where detonations are in a device that meet the 22 CCR 66260.10 definition of a container, the requirements for “temporary units,” as set forth in 22 CCR 66264.553 apply.	The regulations include generally described narrative standards. Compliance with substantive requirements is achieved through regulatory coordination of site-specific work plans in accordance with CERCLA and FFA. Under CERCLA, the Army is not required to comply with procedural requirements such as obtaining a permit.										
California Health and Safety Code	Title 22, CCR §66265.382	Relevant and Appropriate (3)/ Chemical and Action	Open burning of hazardous waste is prohibited except for the open burning and detonation of waste explosives. Waste explosives include waste which has the potential to detonate and bulk military propellants which cannot safely be disposed of through other modes of treatment. Detonation is an explosion in which chemical transformation passes through the material faster than the speed of sound (0.33 kilometers/second at sea level). Owners or operators choosing to open burn or detonate waste explosives shall do so in accordance with the following table and in a manner that does not threaten human health or the environment. <table><tr><td><u>lb. waste explosives</u></td><td><u>Min. Distance from OB/OD to property</u></td></tr><tr><td>0 to 100</td><td>204 meters (670 feet)</td></tr><tr><td>101 to 1,000</td><td>380 meters (1,250 feet)</td></tr><tr><td>1,001 to 10,000</td><td>530 meters (1,730 feet)</td></tr><tr><td>10,001 to 30,000</td><td>690 meters (2,260 feet)</td></tr></table>	<u>lb. waste explosives</u>	<u>Min. Distance from OB/OD to property</u>	0 to 100	204 meters (670 feet)	101 to 1,000	380 meters (1,250 feet)	1,001 to 10,000	530 meters (1,730 feet)	10,001 to 30,000	690 meters (2,260 feet)	The requirement includes specific standards of control and addresses situations similar to those that may be addressed during MEC remediation; detonation of MEC will comply with these requirements.
<u>lb. waste explosives</u>	<u>Min. Distance from OB/OD to property</u>													
0 to 100	204 meters (670 feet)													
101 to 1,000	380 meters (1,250 feet)													
1,001 to 10,000	530 meters (1,730 feet)													
10,001 to 30,000	690 meters (2,260 feet)													
California Fish and Game Code	§1900 et. seq.	Relevant and Appropriate (1,2,3)/ Action	These statute sections sets forth programmatic and administrative provisions, and in §1908, provides that no person shall import into the state, or take, possess, or sell within this state, except as incident to the possession or sale of the real property on which the plant is growing, any native plant, or any part or product thereof, that the commission determines to be an endangered native plant or rare native plant.	Although the definition of “person” in the statute does not apply to the Army, the standards of control are relevant and appropriate, and the citation is therefore considered as ARAR. The Army is implementing the HMP which contains mitigation measures designed to protect the continued survival of rare and endangered plants.										

**Table 1. Potential Applicable Or Relevant And Appropriate Requirements (ARARs)
Feasibility Study, Impact Area MRA RI/FS, Former Fort Ord, California**

Source or Authority	Requirement, Standard, or Criterion	Type	Description	Remarks
California Fish and Game Code	Title 14, CCR §783 et. seq.	Relevant and Appropriate (1,2,3)/ Action	These regulations provide that no person shall import into the State, export out of the State or take, possess, purchase, or sell within the State, any endangered species, threatened species, or part or product thereof, or attempt any of those acts, except as otherwise provided in the California Endangered Species Act, Fish and Game Code Section 2050, et seq. ("CESA"), the Native Plant Protection Act, the Natural Community Conservation Planning Act, the California Desert Native Plants Act, or as authorized under this article in an incidental take permit. The regulations also provide programmatic and administrative procedures for incidental take permits.	<p>The Section includes specific standards of control with respect to taking rare or endangered plants. Although the definition of "person" in the statute does not apply to the Army, the standards of control are relevant and appropriate, and the citation is therefore considered as ARAR.</p> <p>The Army is implementing the HMP which contains mitigation measures designed to protect the continued survival of threatened and endangered species.</p>
California Clean Air Act (Health and Safety Code)	Title 17, CCR §80100 et. seq.	Relevant and Appropriate (1)/ Action	The regulations provide guidelines, programs and agency procedures for smoke management plans.	<p>The regulations are relevant and appropriate. The Army will comply with substantive elements of the regulations. Under CERCLA, the Army is not required to comply with procedural and administrative provisions; however these elements will be addressed as part of the remedial design/remedial action process.</p> <p><u>Substantive requirements:</u></p> <p>§80110(d) prohibiting burn on no-burn days. The Army will conduct prescribed burns on allowable days in accordance with CCR Title 17, §80110.</p> <p>§80145(o)(1) [local air district smoke management plan or other enforceable mechanisms shall] require the material to be burned to be free of material that is not produced on the property or in an agricultural or prescribed burning operation. Material not to be burned includes, but not limited to, tires, rubbish, plastic, treated wood, construction/demolition debris, or material containing asbestos. The Army will comply with this section by removing tires, structures and other debris from the sites prior to conducting prescribed burns, where it is safe to do so. Numerous MEC items have been removed from the ground surface of the areas where accessible and where it was safe to do so. Emissions from incidental detonation of MEC during prescribed burning are expected to be insignificant, based on a study conducted by the Army, in consultation with EPA and DTSC (<i>Technical Memorandum, Air Emissions from Incidental Ordnance Detonation During a Prescribed Burn on Ranges 43 through 48</i> (Harding ESE, 2001)). The study concluded that air pollutant emissions from incidental MEC detonation during a prescribed burn will be minor compared to emissions contributed directly from biomass burning, and will result in pollutant concentration well below health-protective regulatory screening levels.</p> <ul style="list-style-type: none"> The regulation is intended to protect the public health. The Army will substantively comply with this regulation by implementing the site preparation measures as described above, as well as conducting the burns in accordance with the smoke management program, and applying resources to contain the fire within the intended boundaries to minimize public exposure to smoke.

**Table 1. Potential Applicable Or Relevant And Appropriate Requirements (ARARs)
Feasibility Study, Impact Area MRA RI/FS, Former Fort Ord, California**

Source or Authority	Requirement, Standard, or Criterion	Type	Description	Remarks
			State of California TBC	
California Fish and Game Commission	Wetlands Resources (pursuant to §703 of California Fish and Game Code; not a statute)	Policy (1,2,3) / Location	This policy (1) seeks to provide for the protection, preservation, restoration, enhancement and expansion of wetland habitat in California; (2) strongly discourages development in or conversion of wetlands; and (3) opposes, consistent with its legal authority, any development or conversion which would result in a reduction of wetland acreage or wetland habitat values. To that end, the Commission (1) opposes wetland development proposals unless, at a minimum, project mitigation assures there will be "no net loss" of either wetland habitat values or acreage; and (2) strongly prefers mitigation which would achieve expansion of wetland acreage and enhancement of wetland habitat values.	The policy provides for the protection of wetland resources. CDFG was heavily involved in the development of the Installation-Wide Multispecies Habitat Management Plan (HMP) (and subsequent Wetland Resources Protection Plan specific to former Fort Ord), which include the development of mitigation measures to protect wetland resources.
			Regulations that were considered as potential ARARs but were not considered applicable.	
California Fish and Game Code	§3005		The statute section prohibits the taking of birds or mammals, except non-game mammals, with any net, pound, cage, trap, set line or wire, or poisonous substance. Included in the term "taking" is the killing of birds or mammals by poison.	Birds and mammals will be protected by achieving the identified Remedial Action Objectives (RAOs). Further, the scope of the remedial actions does not include intentional taking of birds and mammals with unlawful devices.
California Fish and Game Code	§4000 et. seq.		This statute section provides that a fur-bearing mammal may be taken only with a trap, firearm, bow and arrow, poison under a proper permit, or with the use of dogs.	The scope of the remedial actions does not involve intentional taking of fur-bearing mammals with unlawful devices.
California Fish and Game Code	Title 14, CCR §460		This regulation makes it unlawful to take Fisher, marten, river otter, desert kit fox and red fox.	The remedial actions will not result in the take of Fisher, marten, river otter, desert kit fox and red fox. The species of red fox protected by the State is located in the Sierra Nevada mountain range. The species of red fox located at former Fort Ord is an introduced species and is not protected by this section.
California Clean Air Act	Health and Safety Code §41701		This statute section prohibits the discharge into the atmosphere from any source whatsoever any air contaminant for a period or periods aggregated more than three minutes in any one hour which is dark or darker than No. 2 on the Ringelmann Chart or obscures the view to a degree equal to or greater than smoke.	Agricultural burning for which a permit has been granted pursuant to Article 3 (commencing with §41850, emission limitations for agricultural burning) are exempt from this requirement per §41704(b). Any prescribed burns that would be conducted for vegetation removal prior to MEC remediation will be conducted under MBUAPCD Rule 407, which implements the requirements of Article 3 (California Health and Safety Code §41850 et. seq.). The exemption applies though the Army is not required to obtain a permit under CERCLA.

REMEDIAL ALTERNATIVE	EPA's 9 CERCLA EVALUATION CRITERIA								
	Threshold Criteria		Balancing Criteria					Modifying Criteria	
	Overall Protection of Human Health & Environment	Compliance with ARARs	Short-Term Effectiveness	Long-Term Effectiveness & Permanence	Reduction of T, M, V Through Treatment	Implementability	Cost	State Acceptance	Community Acceptance
<p><u>Alternative 1</u> No Further Action</p>	<p>Not protective of human health. Unsafe for the future property owner to conduct the required habitat management activities, and for the public.</p> <p>Not protective of the environment. Existing minimum requirements under HMP, and other requirements for management of the habitat such as prescribed burning and monitoring could not be implemented.</p>	<p>Does not comply with ARARs. HMP and other requirements for management of the habitat such as prescribed burning and monitoring could not be implemented.</p>	<p>Not effective in the short term because no action is taken.</p>	<p>Not effective or permanent in the long term since no further action would be taken to address MEC risks. It would be unsafe for the future property owner to conduct the required habitat management activities, and the continued presence of MEC on the ground surface would pose a hazard to the public.</p>	<p>Does not provide reduction because no further action would be taken.</p>	<p>Not administratively feasible to implement. While the No Further Action Alternative would be easy to implement, it would not comply with ARARs. In addition, taking no further action is unacceptable in terms of safety, and the necessary approvals are not expected.</p>	<p>No costs</p>	<p>Addressed in the Impact Area MRA RI/FS ROD once comments on the Proposed Plan have been received. This alternative is not expected to be acceptable to the regulatory agencies.</p>	<p>Addressed in the Impact Area MRA RI/FS ROD once comments on the Proposed Plan have been received. This alternative is not expected to be acceptable to the public.</p>
<p><u>Alternative 2</u> Technology-Aided Surface MEC Remediation and Land Use Controls</p>	<p>Protective of human health. Land Use Controls would provide a level of protection that would allow for proper management of the habitat reserve.</p> <p>Protective of environment. Prescribed burning of CMC habitat is essential for long-term management of listed and sensitive species. Prescribed burning and MEC removals would be performed incorporating required mitigation to avoid and reduce impacts to listed species or critical habitat for species. Post-remediation habitat monitoring would continue to be conducted.</p>	<p>MEC remediation would be implemented in compliance with ARARs. HMP and other requirements for management of the habitat such as prescribed burning and monitoring could be implemented.</p>	<p>Workers and the community would be protected during implementation of prescribed burning, MEC removal, and land use controls via safety protocols. Prescribed burns may cause some smoke impacts to the community, which are expected to be temporary. Community notification and smoke management would minimize potential impacts from smoke. Regarding the environment, would not have significant short-term impacts.</p>	<p>Provides long-term effectiveness and permanence during reuse, because all MEC detected on the surface would be removed, and land use controls would be implemented to mitigate risks from MEC potentially remaining during reuse.</p>	<p>Provides significant reduction through surface MEC removal.</p>	<p>Implementable from an administrative perspective. Necessary approvals to conduct MEC removals and associated habitat management could be obtained. Necessary services, equipment, and skilled workers to implement are readily available. High level of effort to implement; requires significant coordination to implement prescribed burning prior to MEC removals.</p>	<p>\$88.90 million (Table A3)</p>	<p>Addressed in the Impact Area MRA RI/FS ROD once comments on the Proposed Plan have been received. Based on agency comments on the RI/FS, it is anticipated to not be acceptable to the regulatory agencies.</p>	<p>Addressed in the Impact Area MRA RI/FS ROD once comments on the Proposed Plan have been received. This alternative may be acceptable to the public.</p>

Table 2. Summary of Remedial Alternatives Evaluation
Feasibility Study, Impact Area MRA RI/FS, Former Fort Ord California

REMEDIAL ALTERNATIVE	EPA's 9 CERCLA EVALUATION CRITERIA							
	Threshold Criteria		Balancing Criteria					Modifying Criteria
	Overall Protection of Human Health & Environment	Compliance with ARARs	Short-Term Effectiveness	Long-Term Effectiveness & Permanence	Reduction of T, M, V Through Treatment	Implementability	Cost	State Acceptance
Alternative 3 Subsurface MEC Remediation and Land Use Controls	Protective of human health. Provides greatest level of protection; would remove all detected MEC on surface and in subsurface. Land Use Controls would provide a level of protection that would allow for proper management of the habitat reserve. Protective of environment for majority of Impact Area MRA. Prescribed burning of CMC habitat is essential for long-term management of listed and sensitive species. Prescribed burning and MEC removals would be performed incorporating required mitigation to avoid and reduce impacts to listed species or critical habitat. Most significant impacts to the environment due to approximately 320 acres containing high-density anomalies anticipated to require large-scale excavations to remove subsurface MEC. Post-remediation habitat monitoring would continue to be conducted, and habitat restoration as necessary.	MEC remediation would be implemented in compliance with ARARs. HMP and other requirements for management of the habitat such as prescribed burning and monitoring could be implemented for the majority of the Impact Area MRA. The HMP and other requirements currently limit the amount of temporary habitat destruction to 75 acres. Large-scale excavations in high-density anomaly areas of approximately 320 acres are not consistent with the HMP and other requirements. It would therefore be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the ESA.	Workers and the community would be protected during implementation of prescribed burning, MEC removal, and land use controls via safety protocols. Prescribed burns may cause some smoke impacts to the community, which are expected to be temporary. Community notification and smoke management would minimize potential impacts from smoke. Due to logistical considerations involved in conducting subsurface removals, smaller areas would be cleaned up each year; therefore, this alternative would take longer to implement and complete. Regarding the environment, would have significant short-term impacts on the environment for the portions of the Impact Area MRA where areas of high-density anomalies would require excavation and sifting.	Provides long-term effectiveness and permanence during reuse, because all MEC detected on the surface and in the subsurface would be removed using the best appropriate technology, and land use controls would be implemented to mitigate risks from MEC potentially remaining during reuse.	Provides greatest degree of reduction through surface and subsurface MEC removal.	Implementable from an administrative perspective. Necessary approvals to conduct MEC removals and associated habitat management could be obtained. Significant coordination required for excavation of high density anomaly areas. Necessary services, equipment, and skilled workers to implement are readily available. Highest level of effort to implement; requires significant coordination to implement prescribed burning prior to MEC removals.	\$423.20 Million (Table A4)	Addressed in the Impact Area MRA RI/FS ROD once comments on the Proposed Plan have been received. Based on agency comments on the RI/FS, it is anticipated to be acceptable to the regulatory agencies.

Table A-2. Long Term Management Measures Cost Estimate
Track 3 Impact Area MRA Feasibility Study
Former Fort Ord, California

ITEM DESCRIPTION	QUANTITY	UNIT	UNIT PRICE	TOTAL
CAPITAL COSTS (a)				
File Initial Property Transfer Document	1	Entire MRA	\$10,000	\$10,000
Modify or Remove Land Use Controls in Property Transfer Document	1	Entire MRA	\$10,000	\$10,000
Subtotal Capital Costs				\$20,000
Capital Cost Contingency	10%	of Capital Costs		\$2,000
TOTAL CAPITAL COSTS				\$22,000
ANNUAL COSTS (a)				
ANNUAL LTMM COSTS				
Annual Monitoring	1	Entire MRA	\$10,000	\$10,000
Annualized 5-Year Review Reporting Cost	1	Entire MRA	\$10,000	\$10,000
Subtotal Annual Costs				\$20,000
Annual Cost Contingency	10%	of Annual Costs		\$2,000
TOTAL ANNUAL COSTS				\$22,000
TOTAL 30 YEAR ANNUAL COSTS (b)				\$431,000
TOTAL REMEDIAL ALTERNATIVE COST				\$453,000

DEFINITIONS

LTMM = Long Term Management Measure

NPV = Net Present Value

ASSUMPTIONS

These costs are for comparison purposes only, have an accuracy of +50/-30%, and are rounded to the nearest \$1,000.

The following costs are assumed to be addressed under separate programs: (1) Administrative Record management (after submission of documents); (2) Community Relations; (3) Habitat Monitoring and Restoration.

Many design variables and necessary prefield activities have not been established.

Cost estimates will be refined after the field preparation/design is completed.

FOOTNOTES

(a) Unit Costs based on recent Fort Ord specific data provided by Army/USACE for Impact Area MRA or similar site.

(b) USACE/EPA provide guidelines in OSWER Directive 9355.0-75 for estimating remedial alternative costs in Circular No. A-94, Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs, Appendix C, President's Federal Office of Management and Budget (OMB, January 2007) (www.whitehouse.gov). (January 2007; updated yearly). The guidelines for federal projects were applied for estimating the NPV based on annual costs for project durations of 30 years using a rate of return of 3%.

Table A-3. Alternative 2 –Technology-Aided Surface MEC Remediation and Land Use Controls Cost Estimate
Track 3 Impact Area MRA Feasibility Study
Former Fort Ord, California

DEFINITIONS

MEC = Munitions and Explosives of Concern / GIS = Geographical Information System / NPV = Net Present Value

ASSUMPTIONS

These costs are for comparison purposes only, have an accuracy of +50/-30%, and are rounded to the nearest \$1,000.

The following costs are assumed to be addressed under separate programs: (1) Administrative Record management (after submission of documents); (2) Community Relations; (3) Habitat Monitoring and Restoration.

Many design variables and necessary prefield activities have not been established.

Cost estimates will be refined after the field preparation/design is completed.

FOOTNOTES

(a) This alternative assumes Technology-Aided Surface MEC Removal throughout the Impact Area MRA. It is assumed prescribed burning (followed by MEC remedial action) would be implemented using a phased approach of conducting prescribed burning and MEC removals of approximately 800 acres of the 6,560-acre Impact Area MRA per year (2 separate mobilizations and burns at 400-acres each, for a period of approximately 8 years) in accordance with the HMP. Therefore, a Technology-Aided Surface MEC Removal would be conducted on 800 acres of the Impact Area MRA each year for 8 years. Reporting includes preparation of Annual Site Specific Work Plans and After Action Reports for each phase of prescribed burning and MEC removal.

(b) Unit Costs based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for the Impact Area or similar site, and assumes 2 prescribed burns / mobilizations per year. Potential costs associated with community relations and relocation during prescribed burns are not included.

(c) Unit Costs based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for Impact Area or similar site as follows: Unit pricing includes all management and GIS/Database support operations. The scope of work includes establishing site boundary and 1000'x1000' grids. Post-removal digital mapping of anomalies includes 5% manual methods and 95% towed-array method with an average production rate of 2 acres per team day. Unit pricing can be highly variable depending on site conditions. The unit costs are averaged within the range of typical production rates. Potential costs associated with procuring temporary explosive storage bunkers are not included.

(d) Annualized Unit Costs for maintaining roads, fuelbreaks, and performing invasive weed control based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for the Impact Area or similar site as follows: [1] Existing roads would be maintained, including erosion control. [2] Existing fuelbreaks would be maintained. [3] Invasive weed control. Costs assumed by Army until 5 years after property transfer (assumed to be 13 years (8 years to complete MEC remedial action and 5 additional years)). Annualized Unit Costs for performing HMP species monitoring are based on recent Fort Ord specific data provided by the Army/USACE and their contractor(s) for the Impact Area or similar site as follows for: [1] HMP annual plants assumed to be monitored during 3 events in the first 5 years & [2] HMP habitat reserve species (e.g., chaparral) assumed to be monitored during 5 events in the first 13 years. Includes mapping, data management/evaluation, preparation of reports. Each 800-acre area would be managed in this manner.

(e) Annualized Unit Costs based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for Impact Area or similar site. Costs assumed by Army, estimated for a total of 30 years under CERCLA FS Cost Guidance (EPA, 1988): [1] Law Enforcement Ranger personnel (assumes one-third of a full time-equivalent of a law enforcement ranger would be employed during reuse of the Impact Area MRA) enforcing access restrictions along the perimeter of the fenced Impact Area MRA. [2] 4-strand barbed wire fence w/concertina wire in some portions & signs would be maintained, and vegetation would be mowed along the fence line. [3] Construction Monitoring / UXO-qualified personnel support assumes full time two-person qualified MEC personnel team visually observing construction activities or providing support 24 weeks per year. [4] MEC Recognition & Safety Training assumes weekly training and/or refresher training. Costs assumed by Army, assumed to begin after 20 years of vegetation regrowth in approx. 2028; therefore, costs are estimated for 10 years of the total 30 years under CERCLA FS Cost Guidance (EPA, 1988): [5] T₃ 100-acre per year HCP burns, where ground-based methods would be unsafe due to the possible presence of subsurface MEC.

(f) USACE/EPA provide guidelines in OSWER Directive 9355.0-75 for estimating remedial alternative costs in Circular No. A-94, Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs, Appendix C, President's Federal Office of Management and Budget (OMB, January 2007) (www.whitehouse.gov). (January 2007; updated yearly). The guidelines for federal projects were applied for estimating the NPV based on annual costs for project durations under 10 years using a rate of return of 2.7%; 10 to 20 years using a rate of 2.8%; 20 to 30 years using a rate of 3%.

TOTAL REMEDIAL ALTERNATIVE COST				\$423,166,000

Table A-4. Alternative 3 -- Subsurface MEC Remediation and Land Use Controls Cost Estimate
Track 3 Impact Area MRA Feasibility Study
Former Fort Ord, California

DEFINITIONS

MEC = Munitions and Explosives of Concern
GIS = Geographical Information System
NPV = Net Present Value

ASSUMPTIONS

These costs are for comparison purposes only, have an accuracy of +50/-30%, and are rounded to the nearest \$1,000.

The following costs are assumed to be addressed under separate programs: (1) Administrative Record management (after submission of documents); (2) Community Relations; (3) Habitat Monitoring and Restoration.

Many design variables and necessary prefield activities have not been established.

Cost estimates will be refined after the field preparation/design is completed.

FOOTNOTES

(a) This alternative assumes prescribed burning, followed by Subsurface MEC Removal would be implemented using a phased approach of conducting prescribed burning and MEC removals of approximately 300-acres of the 6,560-acre Impact Area MRA per year for a period of approximately 22 years. Therefore, a Subsurface MEC Removal would be conducted on 300 acres of the Impact Area MRA each year for 22 years. Reporting includes preparation of Annual Site Specific Work Plans and After Action Reports for each phase of prescribed burning and MEC removal.

(b) Unit Costs based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for the Impact Area or similar site, and assumes 1 prescribed burn / mobilization per year. Potential costs associated with community relations and relocation during prescribed burns are not included.

(c) Unit Costs based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for Impact Area or similar site as follows: Unit pricing includes all management and GIS/Database support operations. The scope of work includes establishing site boundary and 100'x100' grids. Vegetation removal includes approximately 20% manual removal methods and 80% mechanical removal methods. Production rates for vegetation removal range from approximately 1 to 8 acres per team day with an overall rate of 2.6 acres per team day. Digital mapping of anomalies includes 5% manual methods and 95% towed-array method with an average production rate of 2 acres per team day. Site erosion control/restoration is limited to straw and crimping. Unit pricing can be highly variable depending on site conditions. The unit costs are averaged within a range of production rates and costs based on site experience. Potential costs associated with procuring temporary explosive storage bunkers are not included. For the entire project for purposes of preparing cost estimates only, assumes approximately 320 acres would require excavation and sifting (15 acres per year for up to 22 years) to include: (1) s (4) habitat restoration (restoration costs were annualized assuming a cost of \$45,000 per acre based on recent Fort Ord specific data provided by the Army/USACE and their contractor(s) for the Impact Area or similar site).

(d) Annualized Unit Costs for maintaining roads, fuelbreaks, and performing invasive weed control based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for the Impact Area or similar site as follows: [1] Existing roads would be maintained, including erosion control. [2] Existing fuelbreaks would be maintained. [3] Invasive weed control. Costs assumed by Army until 5 years after property transfer (assumed to be 27 years (22 years to complete MEC remedial action and 5 additional years)). Annualized Unit Costs for performing HMP species monitoring are based on recent Fort Ord specific data provided by the Army/USACE and their contractor(s) for the Impact Area or similar site as follows for: [1] HMP annual plants assumed to be monitored during 3 events in the first 5 years & [2] HMP habitat reserve species (e.g., chaparral) assumed to be monitored during 5 events in the first 13 years. Includes mapping, data management/evaluation, preparation of reports. Each 300-acre area would be managed in this manner.

(e) Annualized Unit Costs based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for Impact Area or similar site. Costs assumed by Army as follows, estimated for a total of 30 years under CERCLA FS Cost Guidance (EPA, 1988) for [1], [3], and [4]; costs assumed by Army for [2] a total of 22 years: [1] Law Enforcement Ranger personnel (assumes one-third of a full time-equivalent of a law enforcement ranger would be employed during reuse of the Impact Area MRA) enforcing access restrictions along the perimeter of the fenced Impact Area MRA. [2] 4-strand barbed wire fence w/concertina wire in some portions & signs would be maintained, and vegetation would be mowed along the fence line. [3] Construction Monitoring / UXO-qualified personnel support assumes full time two-person qualified MEC personnel team visually observing construction activities or providing escort 24 weeks per year. [4] MEC Recognition & Safety Training assumes weekly training and/or refresher training.

(f) USACE/EPA provide guidelines in OSWER Directive 9355.0-75 for estimating remedial alternative costs in Circular No. A-94, Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs, Appendix C, President's Federal Office of Management and Budget (OMB, January 2007) (www.whitehouse.gov). (January 2007; updated yearly). The guidelines for federal projects were applied for estimating the NPV based on annual costs for project durations under 10 years using a rate of return of 2.7%; 10 to 20 years using a rate of 2.8%; 20 to 30 years using a rate of 3%.

Table A-5. Alternative 4 – Technology-Aided Surface MEC Remediation, With Subsurface MEC Remediation in Selected Areas, and Land Use

**Controls Cost Estimate
Track 3 Impact Area MRA Feasibility Study
Former Fort Ord, California**

DEFINITIONS

MEC = Munitions and Explosives of Concern
GIS = Geographical Information System
NPV = Net Present Value

ASSUMPTIONS

These costs are for comparison purposes only, have an accuracy of +50/-30%, and are rounded to the nearest \$1,000.

The following costs are assumed to be addressed under separate programs: (1) Administrative Record management (after submission of documents); (2) Community Relations; (3) Habitat Monitoring and Restoration.

Many design variables and necessary prefield activities have not been established.

Cost estimates will be refined after the field preparation/design is completed.

FOOTNOTES

(a) This alternative assumes a Technology-Aided Surface MEC Removal throughout the Impact Area MRA, and Subsurface MEC Removal on 10% of the Impact Area MRA (on roads, fuel breaks, and other areas). It is assumed prescribed burning (followed by MEC remedial action) would be implemented using a phased approach of conducting prescribed burning and MEC removals of approximately 800 acres of the 6,560-acre Impact Area MRA per year (2 separate mobilizations and burns at 400-acres each, for a period of approximately 8 years). Therefore, a Technology-Aided Surface MEC Removal would be conducted on 800 acres and Subsurface MEC Removal would be conducted on 80 acres (10%) of the Impact Area MRA each year for 8 years. Reporting includes preparation of Annual Site Specific Work Plans and After Action Reports for each phase of prescribed burning and MEC removal.

(b) Unit Costs based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for the Impact Area or similar site, and assumes 2 prescribed burns / mobilizations per year. Potential costs associated with community relations and relocation during prescribed burns are not included.

(c) Unit Cost assumptions for Technology-Aided Surface MEC Removal are provided in Table A-3

(d) Unit Cost assumptions for Subsurface MEC Removal are provided in Table A-4. For the entire project for purposes of preparing cost estimates only, assumes approximately 85 acres would require reacquisition of anomalies based on digital mapping and Excavation/Sifting (approximately 11 acres per year for up to 8 years under this alternative).

(e) Annualized Unit Costs for maintaining roads, fuelbreaks, and performing invasive weed control based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for the Impact Area or similar site as follows: [1] Existing roads would be maintained, including erosion control. [2] Existing fuelbreaks would be maintained. [3] Invasive weed control. Costs assumed by Army until 5 years after property transfer (assumed to be 13 years (8 years to complete MEC remedial action and 5 additional years)). Annualized Unit Costs for performing HMP species monitoring are based on recent Fort Ord specific data provided by the Army/USACE and their contractor(s) for the Impact Area or similar site as follows for: [1] HMP annual plants assumed to be monitored during 3 events in the first 5 years & [2] HMP habitat reserve species (e.g., chaparral) assumed to be monitored during 5 events in the first 13 years. Includes mapping, data management/evaluation, preparation of reports. Each 800-acre area would be managed in this manner.

(f) Annualized Unit Costs based on recent Fort Ord specific data provided by the Army/USACE and/or their contractor(s) for Impact Area or similar site. Costs assumed by Army, estimated for a total of 30 years under CERCLA FS Cost Guidance (EPA, 1988): [1] Law Enforcement Ranger personnel (assumes one-third of a full time-equivalent of a law enforcement ranger would be employed during reuse of the Impact Area MRA) enforcing access restrictions along the perimeter of the fenced Impact Area MRA. [2] 4-strand barbed wire fence w/concertina wire in some portions & signs would be maintained, and vegetation would be mowed along the fence line. [3] Construction Monitoring / UXO-qualified personnel support assumes full time two-person qualified MEC personnel team visually observing construction activities or providing escort 24 weeks per year. [4] MEC Recognition & Safety Training assumes weekly training and/or refresher training. Costs assumed by Army, assumed to begin after 20 years of vegetation regrowth in approx. 2028; therefore, costs are estimated for 10 years of the total 30 years under CERCLA FS Cost Guidance (EPA, 1988): [5] Type II fire suppress

(g) USACE/EPA provide guidelines in OSWER Directive 9355.0-75 for estimating remedial alternative costs in Circular No. A-94, Guidelines and Discount Rates for Benefit-Cost Analysis of Federal Programs, Appendix C, President's Federal Office of Management and Budget (OMB, January 2007) (www.whitehouse.gov). (January 2007; updated yearly). The guidelines for federal projects were applied for estimating the NPV based on annual costs for project durations under 10 years using a rate of return of 2.7%; 10 to 20 years using a rate of 2.8%; 20 to 30 years using a rate of 3%.
