1.0 INTRODUCTION

Fort Ord is a former U.S. Department of the Army (Army) base located in the coastal area of northwestern Monterey County. The base was used by the Army for various training operations from 1917 through 1994. Included among the numerous training operations pursued at the former Fort Ord were firing ranges that were used for training in the use of various weapons and military munitions. As a result, a wide variety of conventional munitions and explosives of concern (MEC), both unexploded ordnance (UXO) and discarded military munitions (DMM) items, have been encountered at sites throughout the former Fort Ord.

This Track 2 Munitions Response (MR) Remedial Investigation/Feasibility Study (RI/FS) was prepared for Bureau of Land Management (BLM) Area B and Munitions Response Site 16 (MRS-16) located within the former Fort Ord in Monterey County, California. The work was performed to evaluate previous investigation activities and to develop and evaluate remedial alternatives consistent with Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). BLM Area B is comprised of several Munitions Response Sites (MRSs), and areas located in-between the identified MRSs, north and east of the Impact Area (Figure 1-1). Munitions responses were performed at these MRSs.

MRS-16 is located south of and contiguous with BLM Area B (Figure 1-1). Interim remedial action was conducted at MRS-16 based on an Interim Action Record of Decision (ROD; Army, 2002a). This document provides a focused Feasibility Study (FS) to evaluate the possible need for any long-term response action to address residual risk at MRS-16.

The majority of BLM Area B was transferred to BLM in 1996. The remainder of BLM Area B and MRS-16 is planned for future transfer to BLM. The areas included in BLM Area B are currently open to public access for recreational use of the established trails and roads. These uses have been supported safely since 1996 with past and current measures including public education activities and munitions responses in known and suspected areas.

Evaluations and conclusions presented herein are based on reviews of data acquired during previous investigations. This RI/FS only addresses the explosive safety risks associated with MEC. Potential soil contamination is being addressed under the Basewide Range Assessment (BRA) program.

Based on the *Ordnance and Explosives (OE) RI/FS Work Plan* (U.S. Army Corps of Engineers [USACE], 2000) and the *Final Remaining RI/FS Areas Management Plan* (MACTEC/Shaw, 2010), the sites located within BLM Area B were recommended to be evaluated under the

Track 2 process described below. MRS-16 was previously addressed through an Interim Action ROD and is included for completion of the CERCLA documentation process.

1.1 Description of the Former Fort Ord Munitions Response RI/FS Program

This section describes the MR RI/FS program for the former Fort Ord. The MR RI/FS program at the former Fort Ord is being conducted in accordance with CERCLA. The Fort Ord MR RI/FS program addresses only the physical or explosive risk from MEC.

The RI/FS program under provisions of the OE RI/FS Work Plan includes the following:

- identification of historical site use by review of historical literature and archived documentation;
- evaluation of previous munitions response actions performed;
- development of applicable work plans and sampling and analysis plans for additional characterization;
- completion of an Ordnance Detection and Discrimination Study (ODDS);
- identification of potential Applicable or Relevant and Appropriate Requirements (ARARs); and
- evaluation of potential risks and long-term risk management requirements.

The Fort Ord MR RI/FS program is organized as a "tracking" process whereby sites with similar characteristics will be grouped to expedite cleanup, reuse, and/or transfer based on current knowledge. A site or area is assigned to a specific "track" (i.e., Track 0, 1, 2, or 3) according to the level of military munitions usage and military munitions investigation, sampling, or removal conducted to date, as described in the *OE RI/FS Work Plan* (USACE, 2000). Track 0 areas at the former Fort Ord contain no evidence of MEC and have never been suspected as having been used for military munitions-related activities of any kind. Track 1 sites were suspected to have been used for military training with military munitions, but based on a remedial investigation, no further action is required. Track 2 sites are areas at the former Fort Ord where MEC items were present, and MEC removal has been conducted. Track 3 sites are those areas where MEC investigation had not yet been completed at the time. In keeping with the *Final Remaining RI/FS Areas Management Plan*, the MRSs that comprise BLM Area B are being evaluated as Track 2 sites.

1.2 Track 2 RI/FS

This section describes the elements and the purpose of the Track 2 MR RI/FS for BLM Area B and MRS-16.

1.2.1 Purpose

The purpose of this report is to provide a comprehensive evaluation of BLM Area B and MRS-16 with regard to potential MEC risks consistent with the CERCLA process. The primary objectives of this evaluation are: (1) to describe the site conditions and the results of the site evaluation, and to determine whether the existing data can be used to complete an Risk Assessment (RA); (2) if the data are useable, to complete the RA; and (3) if actionable potential risk is identified based on the RA, to evaluate remedial alternatives in an FS. The completion of the CERCLA process will also support transfer of the portion of BLM Area B and MRS-16 that has not yet been transferred.

1.2.2 Elements of the Track 2 RI/FS

The evaluation of BLM Area B and MRS-16 data as summarized in this document was performed in accordance with the *Final Plan for Evaluation of Previous Work, Ordnance and Explosives Remedial Investigation/Feasibility Study* (EPW; Harding Lawson Associates [HLA], 2000a) which provides the approved framework for evaluation of previously completed munitions response activities at the former Fort Ord and the Track 2 Data Quality Objectives Technical Memorandum (Track 2 DQOs TM; MACTEC, 2003). The RA was performed in accordance with the *Final Fort Ord Ordnance and Explosive Risks Assessment Protocol* (Risk Protocol; Malcolm-Pirnie, 2002). Development of the FS followed U.S. Environmental Protection Agency (EPA) guidance. The evaluation of site data is divided into four separate elements:

- Review of existing literature
- Review of site reconnaissance activities
- Review of sampling activities
- Review of removal actions.

The results of evaluation of these data are integrated into the Remedial Investigation (RI), RA, and FS for BLM Area B. Interim Action was conducted for MRS-16 and a RA was prepared and presented in the MRS-16 remedial action report (Shaw, 2009), therefore, a focused FS was conducted as part of this MR RI/FS for MRS-16 to address residual risks.

1.3 Report Organization

This Track 2 RI/FS is organized as follows:

- **Introduction (Section 1.0)**: This section provides a description of the former Fort Ord MR RI/FS program and summarizes the Track 2 RI/FS purpose and elements.
- Background (Section 2.0): This section describes the physical setting and presents background information on the basewide military munitions response program (MMRP) and regulatory background.
- Remedial Investigation (Section 3.0): The sources of information used in preparation of the RI include, but are not limited to, historical training maps, aerial photographs, MEC removal contractor after action reports, technical information papers (TIPs), archives search reports (ASRs), evaluation of previous work, including data quality criteria, the ODDS report (Parsons, 2000a), field training manuals, interviews with individuals familiar with historical site operations, and Site Assessment Data Reports (Shaw, 2012a, 2012b).

The RI includes discussion of background information, site physical descriptions, site history and development, the anticipated future reuse for the site, a description of the MEC potentially present based on historical use of the area, and history of munitions responses. Additionally, the RI includes a summary of the evaluation of previous work including evaluation of archival documentation, sampling, and removal data, and adequacy of the removal actions conducted, evaluation of the performance of the geophysical equipment used during the investigation, and assessment of data quality. Results of these evaluations are integrated into the presentation of the conceptual site model (CSM).

- Risk Assessment (Section 4.0): The RA presents a description of the elements used for evaluation and the results of the evaluation of potential risk from MEC. The RA integrates site data with the Risk Protocol (Malcolm Pirnie, 2002) to estimate qualitatively the potential risks associated with any potential MEC that may remain at a site for each receptor expected to be present during reuse of the area.
- **Feasibility Study** (**Section 5.0**): The results of the RI and RA are used to develop applicable remedial alternatives for BLM Area B and MRS-16 to meet regulatory criteria and achieve an appropriate level of protection for potential receptors. The FS describes the remedial action objectives (RAOs); the screening, development, evaluation, and

comparison of remedial alternatives; and identification of a preferred alternative(s) for BLM Area B and MRS-16.

• **Approval Process (Section 6.0)**: This section summarizes the proposed process for approval of the MR RI/FS and elements included in that process.

2.0 BACKGROUND

This section provides a description of the physical setting of the former Fort Ord, including the location, general history, land use, site features, and subsurface conditions, and background and regulatory information on the basewide MR RI/FS consistent with EPA guidance.

2.1 Physical Setting

This section describes the physical setting of the site to provide context for discussions of work performed and proposed remedial alternatives.

2.1.1 Location

Former Fort Ord is a 28,000-acre former Army base located in the coastal area in the western portion of Monterey County, California. BLM Area B (Figure 1-1), located in the central portion of the former Fort Ord, comprises 1,597acres and includes the Track 2 MRSs and areas located north and east of the historical Impact Area. MRS-16 is located along the southern boundary of BLM Area B and is approximately 81 acres.

2.1.2 General History

Fort Ord was used by the Army for various training operations from 1917 through 1994. Camp Ord initially was used by the 11th Cavalry and 76th Field Artillery, stationed at the Presidio of Monterey, for maneuvers and training exercises. By 1933, the Camp Ord Military Reservation included Camp Ord, Camp Clayton, and Camp Huffman. In 1940, the land north of Reservation Road was acquired and Fort Ord was designated as a permanent Army post with the activation of the 7th Infantry Division, and subsequent activation of the 4th, 5th, and 6th Divisions. Fort Ord served primarily as a training and staging facility for infantry troops. Fort Ord was a basic training center from 1947 to 1974 and the 7th Infantry Division was activated at Fort Ord on 21 October 1974. In 1991, Fort Ord was identified for Base Realignment and Closure (BRAC), and the facility was closed officially in September 1994 after redeployment of the 7th Infantry Division.

Among the various maneuvers and exercises that took place at the former Fort Ord, training operations included the use of weapons including small arms, artillery, mortar projectiles, rockets, rifle and hand grenades, practice land mines, and pyrotechnics.

2.1.3 *Land Use*

The former Fort Ord consists of both developed land (approximately 8,000 acres) and undeveloped land (approximately 20,000 acres). BLM Area B and MRS-16 are primarily undeveloped. BLM Area B is located within Parcels F1.1.1, F1.2 and F1.3 (Figure 1-1). Parcels

F1.1.1 and F1.2 were transferred to BLM in 1996 as described in a Memorandum of Understanding (MOU; Army, 1995) and a Letter of Transfer from the Army to the Department of the Interior (Army, 1996). Parcel F1.3 has not yet been transferred.

2.1.3.1 Developed Land

BLM Area B and MRS-16 are primarily undeveloped land in the inland portions of the former Fort Ord, with only minor development of support facilities associated with training that occurred (e.g., access roads, observation towers, targets, trenches, bunkers, fighting positions, bivouac areas, etc.).

2.1.3.2 Undeveloped Land

BLM Area B and MRS-16 are primarily undeveloped land with the exception of support facilities noted above.

2.1.3.3 Current and Future Land Use

The *Fort Ord Base Reuse Plan* developed by the Fort Ord Reuse Authority (FORA) (Reuse Plan; FORA, 1997) identified land use categories for various areas of the former Fort Ord that included development of public, commercial, and residential areas as well as areas for open space, recreation, and habitat management. Designated development and habitat reserve areas are also identified in the *Installation-Wide Habitat Management Plan (HMP) for Fort Ord* (USACE, 1997). The East Garrison and Parker Flats Land Use Modification Assessment (Zander, 2002), and the Revised Attachment A – HMP map (April, 2005) present the revised boundaries of the habitat reserve areas. The HMP, as modified or updated, describes special land-use controls and habitat monitoring requirements for target species within the habitat reserve and development areas that apply to Army's environmental cleanup actions as well as land management under future uses. Post-disposal (after the Army transfers the property) management guidelines outlined in the HMP for the Natural Resource Management Area (NRMA), which includes BLM Area B and MRS-16, includes habitat restoration, enhancement and monitoring, access control, controlled burning and an allowance for development-oriented use in as much as two percent of the area.

In 2012, current and future BLM lands at the former Fort Ord, including BLM Area B and MRS-16, were designated as the Fort Ord National Monument. Presidential Proclamation 8803 states, "The protection of the Fort Ord area will maintain its historical and cultural significance, attract tourists and recreationalists from near and far, and enhance its unique natural resources, for the enjoyment of all Americans." In addition, the proclamation safeguards the use of the Fort Ord National Monument by stating that "All Federal lands and interests in lands within the

boundaries of this monument are hereby appropriated and withdrawn from all forms of entry, location, selection, sale, leasing, or other disposition under the public lands laws, including withdrawal from location, entry, and patent under the mining laws, and from disposition under all laws relating to mineral and geothermal leasing other than by exchange that furthers the protective purposes of the monument." (The White House, 2012)

In a 2007 correspondence to the Army (Pool, 2007), BLM provided information on its habitat management program that would be incorporated into the Habitat Conservation Plan being prepared by FORA in coordination with recipients of former Fort Ord lands. As described in the 2007 correspondence, BLM's management activities emphasize preserving, maintaining, and restoring (as appropriate) habitat quality of maritime chaparral and other habitat types within the NRMA and promoting the preservation of all HMP covered species. In general, undeveloped areas in the NRMA will be maintained in their natural state. No more than two percent of the areas supporting native vegetation may be converted to areas with buildings or other development oriented uses. Only land management consistent with the conservation of biological resources will be conducted in the NRMA.

Types of activities that will be conducted in the NRMA include:

- route, road and trail management and maintenance,
- habitat enhancement (including prescribed burns, control of noxious weeds, and restoration),
- fuelbreak construction and management,
- use of administrative areas.
- aquatic monitoring and educational programs, and
- species-specific monitoring and habitat enhancement.

Recreational access will be allowed on established routes. No public motorized use on these routes will be allowed. During special events such as bike or equestrian races, motorized use of some trails may be allowed for equipment staging, safety purposes and/or emergency access. Vehicles may also be allowed on some trails for scientific research projects (Pool, 2007).

The majority of BLM Area B has been transferred to BLM and is currently open to public access, for recreational uses such as hiking, bicycling, and horseback riding. These uses have been supported safely with past and current measures including munitions responses in known and suspected sites; continued use of roads and trails; providing MEC recognition and safety training to BLM; and implementation of MEC incident reporting system. The Army and BLM have been

and will continue to coordinate actions to promote MEC safety on an ongoing basis (signs/notices, MEC incident reporting procedures, and MEC recognition and safety training). Reporting of suspected munitions items discovered on federal property is currently being implemented according to the procedure described in Appendix G, paragraph 6.a.of the *Munitions Response Site Security Program* (Army, 2011). During the 10-year period from 2004 to 2013, 14 incident reports were recorded; all involved practice or maneuver training type munitions. Thirteen of them were munitions debris (MD) and one was UXO (Army, 2013).

2.1.4 Site Features

Physical site features of the area are summarized in the following subsections.

2.1.4.1 Climate

The Mediterranean climate of the area is strongly influenced by proximity to the Pacific Ocean, which generally moderates the temperature range. Fog is common, especially during the summer months, and prevailing winds typically are from the west. Average daily high temperatures range from around 60 degrees Fahrenheit (°F) in winter to 70 °F in summer, with a record high temperature of 104 °F and a record low of 20 °F in nearby Monterey. Rainfall typically occurs between November and April, with annual rainfall accumulation of about 14 inches in the vicinity of Marina and 19 inches in Monterey.

2.1.4.2 Ecological Setting

Environmental conditions in the vicinity of the former Fort Ord support a diverse biological community that includes floral and faunal species considered rare, threatened, endangered, or of special concern or status. *The Flora and Fauna Baseline Study of Fort Ord, California* (Jones and Stokes, 1992) provided results of initial field surveys that were performed to catalog the species present and ascertain the presence of special status species. The various floral and faunal species of concern, collectively referred to as "special status natural resources," are subject to various levels of protection under federal, state, and local laws and regulations that include the federal Endangered Species Act (ESA).

Implementation of a management program to address concerns over special status natural resources resulted in preparation of the HMP (USACE, 1997) in response to the U.S. Fish and Wildlife Service's (USFWS) *Final Biological Opinion for the Disposal and Reuse of Fort Ord* (1993), which required development of a plan to minimize adverse effects on listed species. Subsequent biological opinions (BOs; USFWS, 1999, 2002, 2005, 2007, 2011, and 2014), evaluations (Zander, 2002), agreements (FORA, 2004), and a revision to the management plan

(Revised Attachment A, Habitat Management Plan Map [USACE, 2005]) further clarified and defined the parameters of the habitat management program.

The area occupied by the former Fort Ord contains substantial portions of the populations or available habitats for special status species and therefore presents important management issues for protection of habitat-dependent species. For example, approximately 50-70 percent of the entire population of sand gilia is located on former Fort Ord lands (*Draft Fort Ord Disposal and Reuse Biological Assessment*) (USACE, 1993a, 1993b).

The California Department of Fish and Wildlife (CDFW, formerly California Department of Fish and Game [CDFG]) considers two plant communities that are present at the former Fort Ord as items of particular concern (CDFG, 1997) because of the biota that they support and the diminishing number of similar communities elsewhere. Central Maritime Chaparral (CMC) and valley needlegrass grassland are the two priority biological communities that exist in the area. These communities typically support special-status wildlife species.

Figure 2-1 shows the Fort Ord plant communities that are present within BLM Area B. The dominant community is the CMC that covers about 1,154 acres of BLM Area B and all of MRS-16 (about 81 acres). Other communities include the coast live oak woodland community (about 129 acres), the inland coast woodland community (about 41 acres), the grassland community (about 211 acres), and the wetland community that comprises about 35 acres of the site. Approximately two acres of coastal scrub and seven acres of coast live oak savanna are also present.

Special-status wildlife that occurs or potentially occurs at the former Fort Ord includes one invertebrate, one reptile, two amphibians, 11 birds, and two mammals. The greatest diversity of wildlife species occurs in chaparral communities that potentially host special status wildlife species such as California black legless lizard (*Anniella pulchra nigra*), Monterey dusky footed woodrat (*Neotoma macrotis luciana*), coast horned lizard (*Phrynosoma coronatum*), golden eagle (*Aquila chrysaetos*) and loggerhead shrike (*Lanius ludovicianus*).

Special status wildlife species potentially occurring in the inland coast live oak woodland community include California tiger salamander (CTS) (*Ambystoma californiense*), California black legless lizard, dusky-footed woodrat, American badger (*Taxidea taxus*), Cooper's hawk (*Accipiter cooperii*), and yellow warbler (*Dendroica petechia*).

In the grassland community, special status wildlife species are potentially represented by American badger, CTS, California horned lark (*Eremophilia alpestris actia*), golden eagle, northern harrier (*Circus cyaneus*), loggerhead shrike, tricolored blackbird (*Agelaius tricolor*), prairie falcon (*Falco mexicanus*) and burrowing owl (*Athene cunicularia hypugaea*).

Special status wildlife species possibly occurring in the wetland community include Monterey ornate shrew (*Sorex ornatus salarius*), sharp-shinned hawk (*Accipiter striatus*), Cooper's hawk, Northern harrier, yellow warbler, tricolored blackbird, CTS, California red-legged frog (*Rana aurora draytoni*), Southwestern pond turtle (*Emmys marmorata pallida*), and California linderiella (*Linderiella occidentalis*).

From 1994 to the present, baseline and follow-up surveys in MRS-16 and portions of BLM Area B have been conducted for habitats identified in the HMP that are potentially affected by Army predisposal (prior to property transfer) activities. These data are presented in annual monitoring reports from 1994 through 2011 (Jones & Stokes, 1995; HLA, 1996, 1997, 1998, 1999, 2001; Harding ESE, 2002; MACTEC, 2003; Burleson Consulting, 2009; Tetra Tech, Inc., 2012).

Surveys of representative wetland areas were conducted in 1992 baseline studies. Because of safety hazards associated with working in areas where MEC remediation has not been completed, additional wetland sites were identified/ mapped using aerial photography interpretation (Burleson, 2006).

Data collected during water body surveys in 1992, 1994, 1998, and 2000 to 2004 included habitat, approximate wetland surface area, maximum water depth, pH, turbidity, occurrence and abundance of fairy shrimp species, occurrence of special-status species, and vegetation characteristics. Two wetland-associated special-status wildlife species, the tricolored blackbird and CTS, were found during the 1992 baseline survey. California linderiella, a state species of special concern, is the only fairy shrimp species that has been encountered during wetland surveys. No federally listed threatened or endangered fairy shrimp species have been observed.

Since 1998, wetland monitoring has been conducted at several MRSs. Although some wetlands were disturbed during remedial activities, to date all wetlands recovered naturally and did not require active restoration. Hydrologic data were collected during the wetland monitoring events. California linderiella, CTS, and Contra Costa goldfields were the only special-status species encountered during these surveys (Burleson, 2006).

Potential habitat for two additional special-status species associated with wetlands, the California red-legged frog and southwestern pond turtle, has been identified although these species were not found onsite. (Burleson, 2006)

2.1.4.3 Topography and Hydrology

The topography of BLM Area B consists of low rolling hills. Elevations at the former Fort Ord range from approximately sea level at the beach to above 900 feet mean sea level (MSL) at

Wildcat Ridge. Elevations in the northern portion of BLM Area B range from 200 feet MSL in the east to 600 feet MSL in the center. Elevations in the eastern portion of the BLM Area B range from 150 feet MSL at Mudhen Lake to 690 feet MSL in the south. Runoff is minimal due to the high rate of surface water infiltration into the permeable dune sand; consequently, well-developed natural drainages are absent throughout much of this area. However, erosion has been observed primarily where roads were carved into slopes. In these areas, small gullies are present, but generally end shortly after the topography flattens out.

As described in the Interim Action RI/FS, elevations at MRS-16 range from approximately 420 feet MSL near the western end to approximately 450 feet MSL near the eastern end. The western end is relatively flat sloping gently upward to the north and west. This gently rolling terrain is typical of the Pleistocene-age dune sand deposits of this area. These dune deposits may be as much as 250 feet thick. The mature plant communities in the area largely stabilize these widespread, unconsolidated deposits. (Harding ESE, 2002).

Closed drainage depressions typical of dune topography are common. Runoff is into the Salinas Valley. The locations of known wetlands (constructed ponds and/or vernal pools) in BLM Area B and MRS-16 are shown in Figure 2-1.

As shown on Figure 2-1, Mudhen Lake is located within MRS-21. Surrounding Mudhen Lake, the site consists of grasslands bordered by inland coast live oak woodland. The lake itself was originally a vernal pool; however, the Army established the lake as a permanent lake in the early 1960s.

2.1.4.4 Geology and Hydrogeology

This section provides a summary of subsurface geologic and hydrogeologic conditions at the former Fort Ord.

2.1.4.5 Geology

In the former Fort Ord area, Mesozoic granitic and metamorphic basement rock is overlain by a succession of mostly Miocene marine sedimentary rocks, Pleistocene eolian and fluvial sands, and poorly consolidated Pleistocene to Holocene gravels, sands, silts, clays, and dune deposits up to 250 feet thick. Deposition of sediment since Pleistocene time has been associated largely with a series of sea level fluctuations resulting in marine transgression/regression cycles and associated sediment deposition and erosion. The unconsolidated sands and gravels typically represent periods of relatively lower sea levels, and clays typically represent higher sea levels and deposition in estuarine environments. A detailed geological discussion is provided in Volume II of the *Final Basewide Remedial Investigation/Feasibility Study* (HLA, 1995).

2.1.4.6 Hydrogeology

The Salinas Basin and the Seaside Basin are the two main hydrogeologic structures underlying the former Fort Ord and were described in detail in the *Basewide Hydrogeologic Characterization, Fort Ord, California* (HLA, 1994). The Salinas Basin underlies approximately the northern one-third of the former Fort Ord; the Seaside Basin underlies approximately the southern two-thirds of the installation. Therefore, only the Seaside Basin is discussed in this report.

The Seaside Basin reportedly consists of the following four aquifers, from depth to ground surface: the Monterey Formation aquifer, the Santa Margarita Formation aquifer, the Paso Robles Formation aquifer, and a perched aquifer.

The Monterey Formation consists of marine siltstone and shale that is known to yield water from fractures. Water-supply wells in the city of Seaside produce water primarily from the Santa Margarita Formation aquifer, which pinches out beneath Seaside. The Paso Robles Formation aquifer is confined or semi confined and is found beneath the Seaside Clay unit of the Paso Robles Formation. The Paso Robles aquifer is a major water-bearing unit in the Seaside Basin.

An unconfined, perched aquifer overlies the Seaside Clay unit of the Paso Robles Formation and may occur in one or more of the following units: Recent Alluvium, the Aromas Sand, and the upper member of the Paso Robles Formation.

2.2 BLM Area B and MRS-16 RI/FS Background

This section provides a summary of the RI/FS and regulatory background of the former Fort Ord to provide the basis for the evaluation at BLM Area B and MRS-16.

2.2.1 Summary of Military Munitions Response Program

Since the BRAC listing of Fort Ord in 1991 and closure of the facility in 1994, MEC removal actions have been performed and documented by the Army in preparation for transfer and reuse of the former Fort Ord property. These removal actions have reduced imminent hazards and have provided information about the types of MEC and the level of hazard at each of the sites.

Work performed at former Fort Ord has been conducted in accordance with the following documents:

• Time-critical removal actions (TCRAs) have been implemented as described in, among others, the Fort Ord Ordnance and Explosive Waste Time-Critical Removal Action Memorandum, the BLM Area East of Parker Flats Action Memorandum, and the Eucalyptus Fire Area Action Memorandum (Army, 1994a, 2002a, and 2003).

- Non-time-critical removal actions are addressed according to the *Final Action Memorandum*, *Phase 2 Engineering Evaluation/Cost Analysis*, *Ordnance and Explosive Sites*, *Former Fort Ord*, *Monterey County*, *California* (U.S. Army Engineering Division Huntsville [USAEDH], 1999). The Action Memorandum, Phase 2 Engineering Evaluation/Cost Analysis (EE/CA) identifies and describes the rationale for continuing with MEC removal actions at MRSs while the basewide MR RI/FS is being conducted, and addresses recommendations for future MEC removal actions.
- All removal actions have been implemented in accordance with the Land Disposal Site Plan (LDSP), LDSP amendments, and explosives safety submissions (ESSs), which have been approved by the Department of Defense Explosives Safety Board (DDESB). These plans are required to describe the nature, extent, and types of known or suspected MEC contamination, the proposed future use of each area, and procedures for mitigating MEC hazards in a manner compatible with the proposed land reuse and in accordance with the Department of Defense (DoD) safety standards.

Other elements of the MR program implemented prior to the basewide MR RI/FS program include the following:

- Archives Search Report MRSs were identified and listed in the 1993 ASR, the 1994
 ASR Supplement 1, and the 1997 Revised ASR (USAEDH, 1993, 1994 and 1997). A
 preliminary site reconnaissance was conducted as part of the ASR to further
 identify/characterize potential MRSs; the results are contained in the 1997 ASR.
- Site Investigation/Sampling Based on the ASR, several MRSs were identified for investigation. Human Factors Applications, Inc. (HFA), UXB International, Inc. (UXB), and USA Environmental, Inc. (USA) performed sampling.

Elements of the MR program implemented as part of the basewide MR RI/FS include the following:

- Literature Review Report, Ordnance and Explosives, Remedial Investigation/Feasibility Study, Former Fort Ord, California (HLA, 2000a) This report was the first step in evaluating existing MEC-related information for the former Fort Ord as part of the MR RI/FS program.
- Draft Final Ordnance and Explosives Remedial Investigation/Feasibility Study Work Plan, Former Fort Ord, California (USACE, 2000b) The OE RI/FS Work Plan describes the overall process for implementing the CERCLA process for MRSs at the

- former Fort Ord and introduces the management of sites within the four tracks (Tracks 0 through 3).
- The EPW (HLA, 2000c) provides the method for reviewing the work completed and determining whether the data meets the established data collection and quality goals through the use of the EPW checklists.
- The Track 2 DQOs TM (MACTEC, 2003) provides the DQOs to "verify that the quality
 of the previous action can be used to support completion of a risk assessment and
 feasibility study." In addition, the Track 2 DQOs TM provides the EPW evaluation
 checklist for removal evaluation.
- Final Record of Decision (ROD), Interim Action for Ordnance and Explosives at Ranges 43-48, Range 30A, and Site OE-16, Former Fort Ord, California (Army, 2002b) This ROD describes the Interim Action for removal of MEC at two areas within the Fort Ord Impact Area (Ranges 43-48 and Range 30A) and one area just to the north of the Impact Area (MRS-16). The interim action included vegetation removal through prescribed burns and removal of surface and subsurface MEC. The activities conducted at MRS-16 are documented in the MRS-16 Munitions and Explosives of Concern Remedial Action Report (Shaw, 2009).
- Final Record of Decision, No Action Regarding Ordnance-Related Investigation (Army, 2002c) This ROD addresses areas at the former Fort Ord that have no known history of munitions-related activities of any kind and have no evidence of MEC. The Track 0 "plug-in" process, which is described in the Track 0 ROD, defines the documentation and procedures required to prepare an Approval Memorandum for identification of Track 0 areas, which then can be considered for a No Action decision.
- Record of Decision, No Further Action Related to Munitions and Explosives of Concern-Track 1 Sites, No Further Remedial Action with Monitoring for Ecological Risks from Chemical Constituents at Site 3 (Army, 2005b) This ROD addresses sites at the former Fort Ord that were suspected to have been used for military training with military munitions, but based on the Track 1 OE RI/FS, each site falls into one of three categories (Categories 1 through 3) and requires no further action (NFA). The ROD also outlines a "plug-in" process by which an Approval Memorandum will be prepared that presents the rationale for designating future sites as Track 1 sites. When approved by the regulatory agencies, the Approval Memorandum will become the decision document for the specific Track 1 site. Twenty-one sites were identified for no further action as part of the Track 1

- ROD. Several other groups of sites also have been identified as Track 1 sites and have proceeded through the Track 1 "plug-in" process.
- Final Record of Decision, Parker Flats Munitions Response Area, Track 2 Munitions Response Site, Former Fort Ord, California (Army, 2008b). This ROD formalizes land use restrictions as part of the remedy for this area.
- Record of Decision, Del Rey Oaks Munitions Response Area, Track 2 Munitions
 Response Site, Former Fort Ord, California (Army, 2008c). This ROD presents the
 selected remedial action for MEC for the Del Rey Oaks MRA. This document formalizes
 land use restrictions as the remedy for this area.
- Record of Decision, Impact Area Munitions Response Area, Track 3 Munitions Response Site, Former Fort Ord, California (Army, 2008a). This ROD presents the selected remedy for addressing MEC in the Impact Area, including technology-aided surface remediation, and subsurface MEC remediation in selected areas, land use controls (LUCs), and habitat management.
- Final Remaining Remedial Investigation/Feasibility Study Areas Management Plan, Former Fort Ord, California (MACTEC/Shaw, 2010). This work plan addresses the process for evaluating remaining areas within the former Fort Ord where Munitions Response activities and associated CERCLA documentation are not complete. The remaining RI/FS areas include both previously identified MRSs and some areas between existing MRSs. BLM Area B is a portion of the areas addressed in this plan.

2.2.2 Regulatory Background

In 1991, Fort Ord was selected for closure. Munitions responses began in 1993 and continued after the base was officially closed in 1994 in preparation for subsequent transfer and reuse of the property. Munitions responses were performed pursuant to the President's authority under CERCLA Section 104, as delegated to the Army in accordance with Executive Order 12580 and in compliance with the process set out in CERCLA Section 120. The regulatory agencies (the EPA, and the California Department of Toxic Substances Control [DTSC], as part of the California Environmental Protection Agency [Cal/EPA]) were provided copies of work plans and after action reports (AARs) for review. The agencies had the opportunity to provide input during MEC investigation and removal actions; however, the removal actions were completed by the Army using its delegated removal authority under CERCLA.

In November 1998, the Army agreed to evaluate MEC at the former Fort Ord in an MR RI/FS consistent with CERCLA. The basewide MR RI/FS, which the Army is preparing and consists

of multiple documents to address MEC hazards on the former Fort Ord, will include input from the community and will require regulatory agency review and approval. The basewide MR RI/FS will evaluate past removal actions as well as recommend future remedial actions deemed necessary to protect human health and the environment under future uses.

An agreement was signed between the Army, EPA, and DTSC to evaluate MEC at the former Fort Ord subject to the provisions of the Fort Ord Federal Facility Agreement (FFA; Army, EPA & DTSC, 2000). The signatories agreed that the FFA provided the appropriate framework and process to address the Army's MEC activities. The FFA originally was signed in 1990 by the Army, EPA, DTSC, and the Regional Water Quality Control Board (RWQCB), Central Coast Region. The FFA established schedules for performing RIs and FSs, and requires completion of remedial actions as expeditiously as possible.

In March 2007, the Army and FORA entered into an Environmental Services Cooperative Agreement (ESCA), which allowed FORA to complete munitions response on approximately 3,300 acres of the former Fort Ord property with funding provided by the Army. The FFA was amended, and FORA's remedial investigation began in 2007. The underlying property was transferred to FORA in May 2009.

In addition, to remain consistent with the ESA, the Army has completed consultations with the USFWS on the Army's predisposal actions, including cleanup of MEC. These consultations have resulted in BOs that include incidental take permits. If a response action results in impacts not previously considered, the Army will consult with the USFWS in accordance with the ESA.

3.0 REMEDIAL INVESTIGATION

This section presents a description of site features, site history, and munitions responses for the area designated as BLM Area B and for MRS-16. BLM Area B includes several MRSs and areas in-between the MRSs located north and east of the historical Impact Area (Figure 1-1, Table 3-1). The descriptions and discussions are based on archival data, previously completed investigations, and removal action. The portion of BLM Area B located north of the historical Impact Area was evaluated as BLM Area B North. The portion of BLM Area B located east of the historical Impact Area is referred to as BLM Area B East. Figure 1-1 shows the geographic distribution of MRSs in BLM Area B East and BLM Area B North, and Table 3-1 lists the MRSs located in BLM Area B East and BLM Area B North.

The descriptions and discussions of BLM Area B East and BLM Area B North are followed by summaries of the MRSs located within each area. Each MRS summary includes information on site use and MEC/MD found at that particular site. MEC/MD items found and removed from BLM Area B are presented in Appendix A (Tables A-1, A-2, and A-3); MRS-16 MEC/MD items found are presented in Table A-4.

The Army has been conducting munitions responses in identified MRSs since 1993, and several evaluations have been previously performed on areas subject to this RI/FS. The Remedial Investigation builds on the wealth of knowledge that has been developed previously through the Archive Search Reports, after-action reports for MEC sampling and removals, and site assessment evaluations.

Evaluations and conclusions presented herein are based on reviews of data acquired during previous munitions responses. Site-specific documents that have been reviewed during this evaluation are cited in the history of MR investigation text presented in following sections.

Interim Action was conducted for MRS-16 and a RA was prepared and presented in the MRS-16 remedial action report (Shaw, 2009). A description of the site is provided in Section 3.4. Based on the completion of the Interim Action at MRS-16, remedial alternatives will be evaluated in the FS (Section 5.0) without further evaluation of the MRS in the RI or RA of this document.

3.1 History of Munitions Responses

The following describes the munitions responses that have been conducted within BLM Area B and MRS-16. Appendix A presents a listing of MEC and MD items found during these munitions responses.

3.1.1 1993 ASR

The purpose of the ASR conducted at Fort Ord was to gather and review historical information to determine the types of munitions used at the site, identify possible disposal areas, identify previously unknown training areas, and recommend follow-up actions. Guidance for conducting archives search did not exist prior to 1995. The 1993 ASR was completed based on the scope of work provided to the USACE, St. Louis District by the USACE, Huntsville Division and on ASRs completed at other military instillations. The archives search included a Preliminary Assessment/Site Investigation (PA/SI) consisting of interviews with individuals familiar with the sites, visits to previously established sites, reconnaissance of newly identified areas, and reviewing data collected during sampling or removal actions (USAEDH, 1993).

Several MRSs (formerly referred to as "OE sites") were identified in the 1993 ASR and additional sites were identified as research continued and were presented in the 1994 and 1997 ASR documents discussed later in Sections 3.2, 3.3, and 3.4.

3.1.2 1994 HFA

HFA was contracted by the USACE Huntsville Division in late 1993 to provide munitions response services at Fort Ord. HFA conducted MEC sampling at MRS-09, MRS-12, and MRS-19 from December 1993 through June 1994. HFA performed work according to the *Fort Ord Phase I Work Plan and Accident Prevention Plan* (HFA, 1993). The work plan describes the procedures that were followed during all aspects of work, including surface and subsurface MEC characterization activities and the quality control plans and reporting. HFA munitions response activities conducted at each MRS are discussed in the history of MR investigation text presented in following sections.

The sampling operation was conducted in two phases, a Grid and Boundary Location Survey, and MEC Surface/Subsurface Sweep and Characterization. Site boundaries were determined using information in the USACE Scope of Work, the Fort Ord Grid and Boundary Survey Plan, and discussions with USACE and Fort Ord representatives during site visits. The sites were investigated using 100 percent sampling. This method requires that 100 percent of the anomalies detected in the sample grids be excavated. If a MEC item was discovered, it was to be reported to the USACE OE Safety Specialist, and the OE Safety Specialist was responsible for determining whether the specific site was to be declared contaminated or if sampling was to continue (HFA, 1993). The Schonstedt GA-52C or the Schonstedt GA-72Cv magnetometers were used to identify anomalies. A maximum search lane width of 5 feet was used during the MEC survey. According to the HFA work plan, survey grids were randomly located. Grids were generally 100 by 100 feet and separated by at least 200 feet. Each grid was given a 100

percent visual surface sweep and a 100 percent subsurface geophysical investigation using the Schonstedt GA-52C or the Schonstedt GA-72Cv. Surface contacts and anomalies were marked with yellow flags for excavation and identification. Subsurface contacts were uncovered using hand tools to a maximum depth of 3 feet below ground surface (bgs). The locations of the diagonal corners of cleared grids were surveyed using global positioning system (GPS) to the degree of accuracy provided by equipment during the timeframe used (+/- 3 to 10 meters). The depths of the items recovered were not required to be recorded. Therefore, the Fort Ord MMRP database has assigned the depth of zero (on the surface) to MEC items recovered by HFA.

The Senior UXO Supervisor (SUXOS) and the Quality Control/Site Safety Officer (QC/SS) inspected 100 percent of the MD removed from the site and vented it, if needed, before it was transported to the Fort Ord Defense Reutilization and Marketing Office (DRMO). Munitions debris was collected, inspected and certified as inert, and turned over to Fort Ord DRMO. A total weight for the HFA work is documented in the HFA removal action report (HFA, 1994).

MEC was to be accounted for and, if possible, model numbers were identified. MEC classified as safe to move was transported to a safe holding area prior to transport to Range 36, the former open detonation area, for detonation. MEC that was unsafe to move was blown in place at the end of each day.

After surface and subsurface removal, each site and prior to the removal of grid markers, the QC/SS performed a minimum of 10 percent QC checks. If a MEC item was detected during the QC check, the entire grid would be searched again. No QC discrepancies were reported. After the QC check was performed, the OE Safety Specialist performed a quality assurance (QA) check of the site prior to accepting the work as complete according to contractual specifications.

3.1.3 1994 ASR Supplement 1

The ASR Supplement 1 (USAEDH, 1994) was performed for the purpose of evaluating additional historical maps and information obtained from on-going research (e.g., interviews, archive searched, and site visits) and remediation activities pursuant to the 1993 ASR for Fort Ord.

3.1.4 1995 UXB

UXB was contracted by the USACE in July 1994 through August 1995 to perform MEC sampling and removal actions on selected sites at the former Fort Ord. UXB conducted removal activities at BLM Area B MRSs including MRS-10A, MRS-10B, MRS-12, MRS-14D, and MRS-21.

Site locations were taken from the 1993 ASR and 1994 ASR Supplement with site perimeters and priorities provided by the Fort Ord BRAC office and USACE project manager. Site perimeter surveys were performed prior to any MEC sampling and removal.

Geophysical instruments (magnetometers) were provided by the USACE. Magnetometers used included the Schonstedt GA-52C, the Schonstedt GA-72Cv, and the Schonstedt GA-52Cx. Investigation grids were 100 feet by 100 feet square and spaced so that no two grids were any closer than 200 feet to provide maximum dispersion of the sample grids throughout the site. Investigation grids were required to cover at least 10 percent of the total area of the site being sampled. Site perimeters and grid separation could be modified by the OE Safety Specialist if needed. Once the investigation grid locations were established, each grid was divided into five-foot wide search lanes. Each lane was investigated visually while simultaneously searching for subsurface anomalies with the magnetometer. Each anomaly was marked (flagged) and excavated by hand by the "UXO specialist." Grids with high concentrations of subsurface ferrous metals required a second sweep normally made at an angle of 90 degrees to the first sweep.

Excavation to a depth of up to four feet bgs (three feet bgs prior to December 14, 1994) was required to identify or confirm the presence of MEC. If the anomaly could not be uncovered within three or four feet bgs, the onsite OE Safety Specialist determined if deeper excavation was required. According to the work plan, the depths for the MEC and MD found during the UXB investigation were to be recorded. However, the grid records did not indicate MEC depths were recorded. The Fort Ord MMRP database has assigned the depth of zero (on the surface) to MEC items recovered by UXB. It should also be noted that in the Fort Ord MMRP database, MEC items recovered by UXB are assigned a location at the center of the grid in which they were identified, because specific locations within the grids is not available in the Fort Ord geographic information system (GIS).

QC checks were performed on each grid after all MEC operations were complete. UXB QC specialists checked a minimum of 10 percent of each grid to confirm that MEC removal was completed properly. After the QC check was performed, the OE Safety Specialist performed a QA check of the site prior to accepting the work as complete according to contractual specifications.

As part of the removal actions, UXB transported MEC items that could be moved to Range 36 and items that could not be moved were blown in place. UXB was required to identify whether the items were high explosive or inert. MEC and MD items were also identified by type, location and quantity.

3.1.5 1997 Revised ASR

The Revised ASR (USAEDH, 1997a) combined information gathered through the previous archive searches with the results of a PA/SI conducted by the USACE. The PA/SI consisted of interviews with individuals familiar with the sites, visits to previously established sites, reconnaissance of newly identified areas, and reviewing data collected during sampling or removal actions. The Revised ASR included a review of munitions responses that had been completed or were in progress at the time.

3.1.6 USA Environmental (USA/CMS)

CMS was issued a contract by the USACE in 1995 to perform munitions response at selected sites within the former Fort Ord. The contract was revised on January 31, 1997 (CMS, 1997). In June 1998, CMS was sold, and the name of the company became USA. In July 1998, USA began to conduct work on Fort Ord. In September 1998, the sale was complete and USA became the prime contractor.

CMS/USA performed work according to three different work plans. The first work plan was dated July 21, 1995 (CMS, 1995) and covered work completed until the second work plan was completed in September 1997 (CMS, 1997a). The second work plan covered work completed prior to completion of a revised work plan in April 2000 (USA, 2000d). The work plans outlined the general procedures that were to be followed during site preparations, sampling (both Sitestats/Gridstats [SS/GS] and 100 percent grid sampling), and removal actions. The plans also described the procedures that would be used for all MEC demolitions and the QC/QA program. CMS/USA conducted sampling and removal activities at MRS-09, MRS-10A, MRS-10B, MRS-12, MRS-19, MRS-14D, MRS-21, MRS-48, and MRS-53BLM.

The objective of CMS/USA's work was to safely locate, identify, and dispose of all MEC located on the project site down to a depth of four feet below ground surface, unless approval was given based on studies, site conditions, or DDESB acceptance of a variance from the four foot depth (CMS, 1997). Sampling activities were performed according to guidelines from a sub-plan to the previously approved work plan under contract DACA87-96-D-0019, Task Order 16. CMS/USA conducted a planned, systematic approach to search and clear the sites resulting in optimum search effectiveness. During the subsurface operations, CMS/USA used a magnetometer capable of detecting a 105mm projectile at a depth of four feet. CMS/USA excavated items to a depth of four feet to determine the identity of the magnetic anomaly. If deeper excavation was required, the on-site OE Safety Specialist determined if deeper excavation was necessary for future land use (USA, 2001a). Munitions type and the depth of items found

were not required to be recorded until mid-1997. Locations of MEC and MD were surveyed using a Trimble XL GPS receiver that had a possible accuracy of +/- one to three meters.

Sample grids were 100 by 200 feet for SS/GS sampling and spaced apart so that no two sample grids were any closer than 200 feet. SS/GS software was utilized on the sample grids to determine the amount and location of sampling, unless otherwise directed by the Contracting Officer. SS/GS sampling used a computer program to statistically estimate the ordnance density of a site or grid during field investigations. It estimates the number of MEC items and can be used to assess whether a site has been characterized adequately. When using SS/GS, the site is to be divided into homogeneous sectors with similar munitions characteristics. The grids are then visually inspected and investigated using a magnetometer and identified anomalies are located, marked, and recorded. If a grid has 20 or fewer anomalies, then all of the anomalies would be investigated. If a grid has more than 20 anomalies, 20 anomalies plus 37 percent of all identified anomalies over 20 were investigated. Generally, 32 to 40 percent of the flagged anomalies were investigated (CMS, 1995).

In 100 percent grid sampling and for removal actions, 100- by 100-foot grids were surveyed and investigated with a magnetometer along maximum 5-foot wide search lanes. Grid searches were accomplished using Schonstedt GA-52Cx magnetometers. Whenever a subsurface anomaly or metallic surface object was encountered, it was investigated. Subsurface anomalies were excavated with hand tools. While digging, a magnetometer was used to check and verify the location of the anomaly (CMS, 1995). Subsurface anomalies were excavated to a designated removal depth.

MEC that was unsafe to move was blown in place, and MEC that was able to be moved was consolidated for demolition. After detonation, the detonation points were inspected by the SUXOS and the QC Specialist to ensure that the MEC was destroyed. MEC and demolition inventories were kept to account for each item found and destroyed. Initially, MD or OE scrap collected by CMS/USA was not required to be documented. Later, destroyed items were investigated to determine whether they were actually MEC or MD. USA noted in the after-action report for the removal action at MRS-14D that the practice of using explosive shape-charges to confirm the suspected MEC items were inert or expended, or actually MEC items, was not instituted until after operations at MRS-14D were completed.

Throughout operations, CMS/USA performed daily operational checks and QC inspections of its work. These inspections consisted of both informal inspections of operational activities and formal inspections of work-in-progress and work completed. The QC Specialist inspected at least 10 percent of each grid using a magnetometer for inspection.

Beginning in April 1997, CMS/USA began locating field latrines using GPS survey equipment. Fifty-two field latrines scattered throughout former Fort Ord were investigated and cleared using Schonstedt GA-52Cx magnetometers. No items were found in those latrines located and swept in BLM Area B (USA, 2001h).

During the period of September through October 1999, USA also conducted visual surface walks in areas north of MRS-10A, MRS-10B, and MRS-58. The work conducted was visual site inspection without the use of technology. USA provided maps and listing of MEC and MD items encountered to USACE (USA, 1999).

3.1.7 Parsons Corporation

Parsons performed work according to the *Programmatic Work Plan* (Parsons, 2004a). The *Programmatic Work Plan* was originally prepared in May 2001 with the second edition published in May 2004. The *Programmatic Work Plan* describes the procedures, methods, resources, and QC/QA that Parsons and its subcontractors used while performing work under contract DACA05-00-D-0003. Site-specific work plans were also prepared to document site-specific procedures and requirements.

Parsons conducted the ODDS to evaluate existing, commercially available, MEC detection instruments and systems, and their ability to discriminate MEC from MD and range related debris at Fort Ord. Parsons, with USA as its subcontractor, conducted ODDS field tests in MRS-10A and MRS-16. Four contiguous 100-foot by100-foot grids were established for Field Trial Site 3 (FTS-3) at MRS-10A, forming a square shape. At MRS-16, three 100-foot by 100-foot grids were contiguous in a north-south direction and one grid was adjacent to the southernmost grid (Parsons, 2002a).

Parsons conducted visual surface removal activities at MRS-09, MRS-27H, MRS-27G, MRS-53BLM, MRS-54, MRS-56, MRS-58, and adjacent areas. After visual surface removal was completed, a visual QC inspection that covered at least 10 percent of the area cleared was performed (Parsons, 2002b).

3.1.8 Shaw Environmental, Inc.

Shaw Environmental, Inc. (Shaw) performed MMRP work at the former Fort Ord under the Total Environmental Restoration Contract DACW05-96-0011. Shaw conducted MEC removal/remedial actions at two areas associated with this RI – the Eucalyptus Fire Area (EFA), which is collocated with parts of BLM Area B, and at MRS-16.

3.1.8.1 Eucalyptus Fire Area TCRA

A munitions reconnaissance survey and TCRA was performed at the Eucalyptus Fire Area between October 2003 and May 2004. The survey and removal action within the EFA was conducted following an accidental wildfire that started at the Military Operations in Urban Terrain site and burned vegetation in the area. The burning of the vegetation provided substantially increased visibility and access to the area to allow the operations to take place effectively.

The TCRA occurred between October 2003 and May 2004 on approximate 367-acre area within the Impact Area MRA. The munitions reconnaissance survey occurred between October and December 2003 on approximately 270 acres of BLM property to the east of the Impact Area MRA boundary. A portion of this area is included in BLM Area B (Figure 3-1). The scope of work for the TCRA included removal of any material potentially presenting an explosive hazard (MPPEH) item encountered on the ground surface, and removal of any MD item encountered on the ground surface greater than two inches in any diameter. The general procedure was to sweep across the designated area with UXO technicians and sweepers (laborers) spread apart across a line, initially at 4 feet apart and later at 8 feet apart. The UXO team lead and GPS technician would follow behind the line and inspect and record the items found. The work plan allowed for the use of Schonstedt GA-52CX magnetometers to supplement visual inspection in areas where surface ordnance could be hidden by vegetation. No areas within the BLM property were identified that required the use of Schonstedt magnetometers.

A total of 22 MEC items and 311 pounds of MD were removed from the BLM property. The MEC items were transferred to the Impact Area for consolidation with other demolition operations.

The Shaw UXO Quality Control Specialist performed a resurvey of each grid with coverage of 10 to 20 percent and, for heavily vegetated grids, 15 to 25 percent coverage. The USACE OE Safety Specialist walked at least 10 percent of each grid. All grids passed QC and QA inspections (Shaw, 2005).

3.1.8.2 MRS-16 Interim Action

An Interim Action MEC remedial action was performed at MRS-16 following a prescribed burn in October 2006. The MEC remedial action at the approximately 81-acre MRS-16 site was conducted between December 2006 and June 2008. The scope of work for the MEC remedial action included removal of any MPPEH item encountered both at the ground surface and to the depth of instrument detection, and removal of any MD item encountered greater than two inches in any diameter. Both EM61-MK2As and Schonstedt magnetometers were used as part of the

MEC remedial action. The subsurface MEC removal to the depth of instrument detection was completed as planned in the original work plan and Record of Decision, with the exception of an approximately 5-acre area in the western portion of MRS-16, addressed in MRS-16 Remedial Action Report as the "saturated area" (Shaw, 2009). Analog subsurface removal was conducted on a portion of the "saturated area," and several trenches were excavated to further investigate the area.

QA and QC seeds were placed in MRS-16 to determine the completeness of digital geophysical mapping (DGM) and removal activities. The Shaw UXOQCS observed the UXO teams daily and performed periodic spot checks to ensure the grids were receiving complete coverage. In addition, the UXOQCS conducted a 10 percent check of grids. The USACE OE Safety Specialist performed QA inspections on 10 percent of each grid. The USACE Geophysical Section performed QA of the digital geophysical data collected during the Interim Action. USACE conducted field oversight, digital data review, and QA seeding, QA digital re-surveys, and QA anomaly excavations. QA activities by USACE verified that Shaw had an adequate QC program in place and that data collected at MRS-16 are sufficient and in accordance with the project DQOs outside of the high concentration area (Shaw, 2009).

3.1.8.3 Basewide Range Assessment

MACTEC and Shaw Environmental performed an evaluation of the potential for soil contamination related to munitions training throughout the former Fort Ord. The investigations were conducted according to the *Basewide Range Assessment Work Plan* (Harding ESE/IT, 2001) and the *Sampling and Analysis Plan, Characterization of Small Arms and Multi-Use Ranges* (MACTEC/Shaw, 2003). These documents outline the process for conducting (1) review of historical documents including historical training maps, aerial photographs, range control records, and munitions after action reports; (2) site reconnaissance and mapping of MEC and MD items, fighting positions, pits, targets, range fan markers, and evidence of possible chemical contamination; (3) limited soil sampling for screening purposes; (4) site characterization; and (5) remediation/habitat mapping. These were applied throughout the former Fort Ord to identify munitions training sites, potential presence of MEC and MD items, and potential presence of munitions constituents related to munitions training. The BRA also evaluated the potential for chemicals, such as total petroleum hydrocarbons which could be associated with flame thrower training or flame field expedient training. The results of the BRA are presented in the *Basewide Range Assessment Comprehensive Report* (MACTEC/Shaw, 2012).

3.1.8.4 MACTEC/Shaw Site Assessment

The Final Remaining Remedial Investigation/Feasibility Study Areas Management Plan, Former Fort Ord, California (MACTEC/Shaw, 2010; "Management Plan") addressed the process for evaluating remaining areas within the former Fort Ord where MR activities and associated CERCLA documentation were not complete. Based on the evaluation of available data, the Management Plan outlined additional field investigation through site assessment. This site assessment process consists of two parts: (1) the pre-field data evaluation and (2) the site assessment field investigation. The pre-field data evaluation, which was described in the site assessment Technical Memorandums for the BLM East/Post-1940 and BLM North areas (MACTEC/Shaw, 2011a, 2011b), consisted of an extensive review of maps, records, interviews, reports, and previous munitions responses. The site assessment field investigation included visual and technology-aided mapping of site features related to past training activities, mapping of MEC or MD identified during the site assessment, and mapping of the paths walked.

The MRSs located in BLM Area B East (MRS-12, MRS-21, MRS-14D, and MRS-25, and MRS-26) were not investigated as part of the site assessment because they were identified in the Management Plan as Track 2 RI/FS candidates. MRS-09, MRS-10A, MRS-10B, MRS-19, MRS-27I, MRS-41, MRS-48, and MRS-53BLM also were identified Track 2 RI/FS candidates; therefore, no field work was conducted in these MRSs during site assessment activities.

The areas addressed during the site assessment field activities include MRS-54, MRS-56, MRS-58, MRS-27G, MRS-27H, MRS-27J, and the areas adjacent to these MRSs. The field investigation at these sites consisted of a combination of visual and technology-aided searches. These included approximately 62 miles of random visual searches, and technology-aided random and biased searches using a Schonstedt GA-52Cx. Focused characterization was conducted in the northern portion of BLM Area B North (north of MRS-54) to confirm that this area was not used as a target area. The focused characterization included approximately 17 miles of biased searches using both a Schonstedt GA-52Cx and a Geonics EM61. Search path spacing was established based on VSP analysis. Five Geonics EM61-aided meandering transects covered approximately 3 miles that were masticated to create paths in areas that were not accessible due to dense vegetation. The balance of search paths was limited to trails and areas of less dense vegetation. No target area was identified (Shaw, 2012b).

3.2 BLM Area B East Area – MRS Descriptions

BLM Area B East is in the northeastern portion of the former Fort Ord (Figure 3-1). The property was purchased from private landowners by the government in 1917. The Track 2 MRSs in the northern portion include MRS-12 and MRS-21, comprising approximately 43 acres. The

Track 2 MRSs in the southern portion include MRS-14D (including small portions of MRS-14B and MRS-14E), MRS-25, and MRS-26, covering approximately 98 acres (MRS acreages are provided in Table 3-1).

Summaries of the Track 2 MRSs located within BLM Area B East, including area description and history, and a history of munitions responses at each MRS, is provided below. Figures 3-1 and 3-2 present a summary of the investigation activities and results. Tables presenting lists of the MEC and MD items found at these sites are presented in Appendix A, Table A-1 and Table A-2. Figures showing detailed distribution of MEC found by munitions type are provided in Appendix B.

3.2.1 MRS-12

3.2.1.1 MRS-12 Area Description and History

MRS-12 (Picnic Canyon) consists of approximately 28 acres, in the east-central portion of Fort Ord, west of Jacks Road, and south of MRS-21. The northern half of the site consists mostly of grassland and oak woodland, while the southern portion is mostly CMC. MRS-12 reportedly was used as a "firing point and target area for mortar projectiles, rifle grenades, and shoulder-launched projectiles in the 1940s and 1950s" (USAEDH, 1997a). The site was also reportedly used as a live-fire reaction course, and helicopters were believed to have fired weapons into this canyon (MACTEC/Shaw, 2012).

3.2.1.2 MRS-12 History of Munitions Response

The following describes the munitions responses that have been conducted at MRS-12. Appendix A (Table A-1) contains a listing of the munitions (both MEC and MD) found during the munitions responses described below.

The vegetation at MRS-12 is generally moderate. Brush trimming at the site was kept to the minimum necessary to allow for removal operations.

In 1993 and 1994, HFA sampled the site for MEC and located twelve "40 mm target practice (TP) cartridges" (HFA, 1994). These items were later classified as MD during database quality control review.

In 1994 and 1995, UXB conducted MEC removal at a random 20 100- foot by 100-foot grids in the site to a depth of four feet. Investigation activities identified 6,960 small arms ammunition items, five MEC (UXO) items (cartridge cases, 40mm; grenade, hand, smoke; flare, surface, trip; and pyrotechnic mixture), and pyrotechnic items that were identified as MD (UXB, 1995a). Depths for the MEC and MD found during the UXB investigation were not required to be documented at the time this operation took place and are assigned the depth of zero in the

MMRP database. It should also be noted that items are assigned a location at the center of the grid in which they were identified because specific locations within the grids were not documented.

In September 1997, USA began munitions removal activities over 100 percent of the site to a depth of one foot. Anomalies found to be buried deeper than one foot were flagged, and GPS locations noted, but were not removed. MEC items (all UXO or insufficient data [ISD] except where noted) removed are presented in Table A-1 and include firing devices, release, M5; grenade, hand, practice, MKII; fuze, grenade, hand, practice, M228; a projectile, 40mm, parachute, illumination, M583 series; cartridges, 40mm, practice, M781 (one DMM); flares, surface, trip, M49 series; flares, parachute, trip, M48; grenade, hand, smoke, M18 series; grenades, rifle, smoke; grenade, rifle, smoke, white phosphorus M19A1; mine, antipersonnel, practice, M8 series, and signal, illumination, ground, M126 series (USA, 2000e). MEC items presented in the Appendix A MEC/MD tables may differ slightly from the data presented in the respective AAR due to quality control updates to the MMRP data base.

Site reconnaissance conducted in July 1999 and August 2001 as part of the BRA identified one foxhole, seven firing points, 18 blank small arms ammunition casings areas, and two small pits. Two additional firing positions and two areas of blank small arms ammunition casings were located off the southeastern corner of the site (MACTEC/Shaw, 2012).

One incidental item (ordnance components) was found by BLM in December 2004.

3.2.2 MRS-21

3.2.2.1 MRS-21 Area Description and History

MRS-21 is approximately 15 acres in size and is in the east-central portion of the former Fort Ord, off Barloy Canyon Road. The east side of the site contains Mudhen Lake. The lake is divided roughly in half by a dike with a footbridge. Surrounding Mudhen Lake, the site consists of grasslands bordered by inland coast live oak woodland. The lake itself was originally a vernal pool. On a 1953 training map (Army, 1953), an artillery position is shown adjacent to Mudhen Lake on the northwestern side of the lake. Because most of the site area is a lake, the ASR indicated a possibility that it was used as a dumping ground for munitions (USAEDH, 1993). MRS-21 was identified as an MRS in the ASR.

3.2.2.2 MRS-21 History of Munitions Response

The following describes the munitions responses that have been conducted at MRS-21. Appendix A (Table A-1) contains a listing of the munitions, both MEC and MD, found during the munitions responses described below.

The vegetation at MRS-21 is generally moderate. Brush trimming at the site was kept to the minimum necessary to allow for removal operations.

In 1994 and 1995, UXB conducted investigations of MRS-21 that included sampling of seven (7) 100-foot by 100-foot grids (approximately six percent of the land area) randomly distributed around the perimeter of the lake on the eastern side, and a removal action was performed on thirty-six (36) 100-foot by 100-foot grids (approximately 32 percent of the land area) on the western side of the site. The 36 removal grids were 100-percent sampled (all anomalies detected were investigated) to four feet, and deeper if approval was obtained from the USACE (UXB, 1995b). The depths at which the items were found during this investigation were not required to be documented at the time this operation took place and are assigned the depth of zero in the MMRP database. Ninety-eight MEC (UXO) and MD items (primarily pyrotechnic training items including flares, signals, rifle-fired smoke grenades, firing devices, practice mines, and grenade fuzes) were removed.

In 1997, USA conducted a visual surface removal over the eastern portion of the site and removal to a depth of one-foot along trails. The surface removal was completed up to the waterline of Mudhen Lake. The removal action was completed in the fall of the year when the lake was at its lowest level. The visual surface removal included the investigation of fifty-four (54) 100-foot by 100-foot grids and partial grids (approximately 48 percent of the land area), including the seven grids previously sampled by UXB. Removal to a depth of one foot was conducted along 2,000 feet of trail that was 6 feet wide. No MEC or MD was discovered during this removal operation (USA, 2000c).

In February 2000, during BLM maintenance activities, a 37mm projectile (UXO) was found within MRS-21. The MEC item was found in the eastern portion of the site where UXB had conducted sampling and USA had conducted the surface removal.

Site reconnaissance was conducted in August 2001 as part of the BRA. Some blank small arms ammunition casings were found during the site visit; however, no MEC items were found. Several items were identified during the reconnaissance, but GPS data are not available for these locations due to technical difficulties. These items included an open 55-gallon drum filled with trash and an expended illumination flare (MD) that were found in the southwestern portion of the site, and a firing point that was found in the northeastern portion of the site (MACTEC/Shaw, 2012). The expended illumination flare found during the BRA site reconnaissance is not listed in the MMRP database, because the location of the item was not collected at the time it was discovered.

In October 2003, a visual surface reconnaissance was conducted over a portion of MRS-21 following an accidental fire in the area (EFA). One MEC (UXO) item, a ground illumination signal (M125 Series) was found and removed (Shaw, 2005).

3.2.3 MRS-14D (Including MRS-25 and MRS-26)

3.2.3.1 MRS-14D Area Description and History

MRS-14D is approximately 82 acres and is located between the Impact Area MRA and the eastern boundary of the former Fort Ord, situated between Barloy Canyon Road and Lookout Ridge Road (Figure 3-1). The site consists of rolling hills covered with native grass (approximately 70 percent of the area) with some coast live oak woodlands. Based on interviews conducted as part of the archives search investigation, the site was suspected of containing 7- and 8-inch naval projectiles that overshot the Impact Area west of the site (USAEDH, 1997a). However, no such projectiles or evidence of such a projectile were identified during munitions sampling and removal actions. Based on site investigations (MACTEC/Shaw, 2010), MRS-14D was identified as Range P-5 on 1972 through 1987 ranges and training maps. This range was used for 14.5mm subcaliber and 22mm subcaliber ranges. Two hilltop firing points within Range P-5 are identified as MRS-25 and MRS-26. MRS-25 and MRS-26 are each approximately 1.3 acres. MRS-25 and MRS-26 were included in the MRS-14D investigation.

3.2.3.2 MRS-14D History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-14D (including MRS-25 and MRS-26). Appendix A (Table A-2) provides a listing of the munitions, both MEC and MD, found during the munitions responses described below.

The vegetation at MRS-14D primarily consists of native grass. Native grass was trimmed to expedite removal operations.

UXB performed MEC sampling operations at Site 14 in 1994 and 1995, before it was subdivided into five parts (A through E). UXB surveyed and removed munitions items from 100-foot by 100-foot random sampling grids, which were spaced so that no two grids were any closer than 200 feet, over what was then Site 14 (UXB, 1995c). Based on the results of this sampling, the site was split into Lookout Ridge II (MRS-14A), Site 14 (MRS-14B), Site 14 SE (MRS-14C), 14 West (MRS-14D), and 14 East (MRS-14E). One MEC (UXO) and several projectile, 22mm, subcaliber MD items, along with two grenade, rifle, smoke MD items, were found in grids located in the portion of Site 14 that is now MRS-14D.

Following UXB sampling operations, CMS conducted MEC sampling operations in MRS-14D between August 31 and November 6, 1995, with a total of 35 100-foot by 100-foot grids and

partial grids (approximately 10 percent of the land area) 100-percent sampled to a depth of four feet. Information regarding MD, range-related debris, and small-arms ammunition removed during the MEC sampling operations at MRS-14D was not documented, because documentation of those items was not required at the time this operation took place. A total of 1,588 MEC (UXO or ISD) items was recovered during this sampling operation. MEC items discovered were primarily projectiles, 22mm, subcaliber, practice, M744 and projectiles, 14.5mm, subcaliber, practice, M183 series. Based on the results of this sampling operation, the decision was made that USA would perform a 100-percent removal action over the entire site (USA, 2001b).

Between September 1995 and January 1997, CMS conducted removal operations on 326 100-foot by 100-foot grids and partial grids (approximately 88 percent of the land area) to four feet deep, with deeper excavations as approved by the USACE OE Safety Specialist. These grids were designed to encompass the entire site except for a deep ravine (located approximately two hundred feet east of, and roughly parallel with, Barloy Canyon Road), which was not included in the MEC removal operations due to safety concerns. During these operations, additional rows of grids were added outside the site boundaries to the north and south to determine the extent of MEC distribution associated with MRS-14D training activities. Not all of these extension grids were 100% investigated, based on a determination made by USACE OE Safety Specialist that the additional removal was not needed. Additional MRS-14D grids also extended east of the site boundary, where they overlapped with the previously investigated MRS-14E grids, to determine the extent of MRS-14D MEC distribution (Figure 3-1).

Removal operations identified and removed approximately 24,000 items, the bulk of which were projectiles, 14.5mm, subcaliber, practice, M181A1, M181A2, or M183A1 (training ammunition for the 105mm, 155mm, and 8-inch howitzers) and projectiles, 22mm, subcaliber, practice, M744 (training ammunition for 81mm mortars). The AAR noted that all suspected UXO items were destroyed using high explosives and had the 14.5mm and 22mm projectiles been inspected before destruction, it is probable that a large percent of these items would have been found to be expended (USA, 2001b).

Additionally, practice 3-inch (Stokes) trench mortar projectiles, practice antitank and smoke-filled rifle grenades, and miniature HC smoke pots were discovered on the site. Hand grenades encountered in MRS-14D include fragmentation, illumination, smoke, and practice versions, as well as one riot control grenade. Various pyrotechnic items were also found along with a single instance of a 90mm high explosive (HE) projectile. As noted in USA's after-action report for the removal action at MRS-14D, depths of recovered items were not required to be recorded until the next contract became effective in April 1997. While the depth of each item was not recorded during the removal action at MRS-14D, the USA report included statements that conveyed

anecdotal observations of recovery depths. According to the report, "22mm subcaliber training projectiles frequently detected at and extracted from depths of 2.0 to 3.5 feet bgs." In addition, "the majority of the 14.5mm subcaliber projectiles extracted from the site were located within 0.5 feet bgs." (USA, 2001b)

This investigation also included 100-percent removal at MRS-25 and MRS-26. No MEC or MD items were recovered within the boundaries of MRS-25. Three 22mm subcaliber M744 practice projectiles were removed from MRS-26.

Removal operation grids that extended into MRS-14B and MRS-14E (Figure 3-2) are included as part of BLM Area B. MRS-14E sampling grids (CMS, 1997b) located adjacent to and overlapping MRS-14D grids, and where MEC items (projectiles, 14.5mm and 22mm, subcaliber) associated with 14D training were found, are also included as part of Area B. Items found in grids located in MRS-14B and 14E are identified as such in Table A-2.

An investigation was conducted in August 2001 as part of the BRA (MACTEC/Shaw, 2012), during which four soil pits and one 105mm projectile cartridge case, expended (model unknown) were identified. No targets remained at the site. Three of the soil pits are located within MRS-25 and MRS-26 boundaries.

In December 2004, incidental items were found by BLM and noted as ordnance components (MD) in the MMRP database.

3.3 BLM Area B North Area – MRS Descriptions

BLM Area B North is in the northeast-central portion of the former Fort Ord north of Eucalyptus Road (Figure 1-1). The MRSs located in this area include: MRS-09, MRS-10A, MRS-10B, MRS-19, MRS-27I, MRS-41, MRS-48, MRS-54, MRS-56, MRS-58, MRS-27H; portions of MRS-53BLM, MRS-27G, and MRS-27J. Included in BLM Area B North are areas adjacent to and in-between the MRSs.

Summaries of the MRSs located within BLM Area B North, including an area description, history and development, a history of munitions responses at each MRS, are provided below. Figures 3-3 and 3-4 present a summary of the investigation activities and results. Tables presenting lists of the MEC and MD found are presented in Appendix A, Table A-3. Because of the amount of data for this area, Appendix B figures are provided to show detailed distribution of MEC found by munitions type.

3.3.1 MRS-09

3.3.1.1 MRS-09 Area Description and History

MRS-09 is an approximately 8-acre site in the center of the former Fort Ord. The site was identified as a mine and booby trap training area and close-combat course in the ASR (USAEDH, 1993). Vegetation on this site consists almost entirely of CMC and coast live oak woodland. On a 1945 training map (Army, 1945), the MRS-09 area is identified as "Close Combat Course." On the same map, the area falls within "Combat Range 2." On the 1956, 1957, and 1958 Fort Ord training maps (Army; 1956, 1957, 1958, respectively), the site is identified as "Mine and Booby Trap Area 2." On a 1967 training map (Army, 1967), Range 50 is seen in the site vicinity. A 1964 map (Army, 1964) indicates that Range 50 may have been used as a munitions disposal area.

3.3.1.2 MRS-09 History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-09. Appendix A (Table A-3) provides a listing of the munitions, both MEC and MD, found during the munitions responses described below.

CMC located in the hillside portion of MRS-09 required vegetation cutting for access and investigation activities. Manual brush cutting methods were used for vegetation removal at the grids located in this area.

In July 1999, USA conducted a 100-percent sampling (all detected anomalies were investigated) to four feet bgs in four 100-foot by 100-foot grids (approximately 13 percent of the land area) at MRS-09. Of the 116 MEC and MD items encountered at the site, a cache of 50 fuzes, grenade, hand, practice, M205 series were found buried at eight inches bgs and identified as DMM. Other MEC (UXO) items found include projectile, 81mm, mortar, practice, M43 and projectile, 60mm, mortar, HE, M49 series. The majority of the MD items included 81mm practice and HE mortar projectiles and 60mm practice mortar projectiles. Other MD items found were classified as ground illumination signals, surface flares, hand and rifle smoke grenade items, and 75mm and 105mm projectiles (USA, 2001f).

The site also was investigated as part of the BRA conducted in December 2001. Mapped items include one expended smoke grenade (model not reported) and two signposts. Access to the eastern portion of the site was limited during the BRA due to thick vegetation (MACTEC/Shaw, 2012).

Parsons conducted non-instrument aided visual surface removal activities in an area that included MRS-09 in 2002, during which a grenade, hand, riot, CS-1 MEC item was found (Parsons, 2002b).

3.3.2 MRS-10A

3.3.2.1 MRS-10A Area Description and History

MRS-10A (Leary Hill Region) is approximately 237 acres in size and is north of the former Impact Area. Vegetation at MRS-10A consists mostly (80 to 90 percent) of CMC with some inland coast live oak woodland in the southeastern portion and some grasslands to the north.

A 1945 training map identifies the majority of the area as being within "Combat Range 2" and the Known Distance Range (Army, 1945). "Machine Gun Square 4" is identified in the northwest corner of MRS-10A in a 1958 training map (Army, 1958). The 1953 and 1956 training maps identify the area as being used by the 2nd Infantry and the 1958 training map identifies its being used by the 1st Brigade (Army, 1953, 1956, and 1958). The 1967 training map identifies a helipad in the southwest corner of the site (USAEDH, 1993).

MRS-27I (Training Site 9) consists of 20 acres and is located completely within the boundaries of MRS-10A. MRS-27I is located southeast portion of the site. The site is identified as Bivouac Area D on a 1972 training map (Army, 1972) and is identified as Training Site 9 on 1976 through 1987 range and training maps (Army, 1976 and 1987).

3.3.2.2 MRS-10A History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-10A. A listing of the munitions, both MEC and MD, found during the munitions responses described below is provided in Table A-3.

Due to the heavy vegetation density at MRS-10A, brush cutting and thinning was performed for access during UXB removal and CMS sampling operations. A controlled burn was conducted in September 1998 to provide access for the USA surface and subsurface removal activities.

In 1994 to 1995, UXB conducted a removal action on 14 acres (approximately four percent of the land area) designated as firebreaks within MRS-10A. Removals to a depth of four feet were performed in 47 grids. A total of 5,018 small arms ammunition items, five MEC (UXO) items (two 81mm mortar projectiles, a 40mm illumination projectile, and two cartridges, 75mm, HE [model unknown]), and 11 MD items were discovered during this removal (USAEDH, 1997a).

CMS conducted sampling of 115 100-foot by 100-foot grids (approximately 10 percent of the land area), to a depth of four feet bgs, between 1995 and 1997. A total of 6,745 small arms

ammunition, 55 MEC (UXO) items (including 75mm projectiles and 81mm mortar projectiles), and 11 MD items were removed (USAEDH, 1997a).

Between April 1998 and August 2000, USA conducted surface removal actions at 640 100-foot by 100-foot grids and partial grids (approximately 57 percent of the land area). Also during this timeframe, USA conducted one-foot removal operations (all anomalies detected from the surface to one foot bgs were investigated) at 572 100- foot by 100-foot grids and partial grids (approximately 50 percent of the land area, see Figure 3-3). Eleven MEC (UXO) items, 214 MD items, and 120 pounds of MD were removed during the surface removal operations; and 247 MEC items, 1,332 MD items, and 2,832 pounds of MD were located and removed during the one-foot removal action (USA, 2001e). The majority of MEC items removed from the site were 81mm HE mortar projectiles, and 81mm practice mortar projectiles, 60mm HE mortar projectiles, 3-inch practice trench mortar projectiles, 75mm projectiles, ignition cartridges (M2 series), 2.36-inch HE rockets, surface trip flares, practice hand grenade fuzes, hand smoke grenades, and hand riot grenades. Anomalies were investigated to a depth of one foot. The 554 anomalies that were not investigated deeper than the one-foot removal depth were documented. USA concluded that MEC likely exists at depths deeper than removal depths (USA, 2001e).

MEC (UXO) items found at MRS-27I include four flares, surface, trip (M49 series); two fuzes, grenade, hand; four cartridges, ignition (M2 series); a firing device, pressure (M1A1); and two grenades, hand, riot (CS, M7A3). These items were found during the USA investigations conducted for MRS-10A as discussed above but are presented in the MRS-27I portion of Table A-3.

An investigation was conducted in August 2001 as part of the BRA (MACTEC/Shaw, 2012). Military training-related features and MD identified during this reconnaissance included: 13 foxholes, 10 areas with blank small arms casings, two areas with spent flares, and 55-gallon drums. The contents of the 55-gallon drums were not identified. Eight of the foxholes are located in the northern portion of the site. No MEC were found during this investigation.

Three incidental MD items (projectiles, 81mm, mortar, practice, M43 series) were found by BLM in August 2001.

Four 100-foot by 100-foot Field Trial grids within MRS-10A were intrusively investigated as part of the ODDS Field Trials. Each grid was surveyed using digital instruments (EM-61, EM-61 HH, G858, and GEM-3). After digital surveys were conducted and diglists were produced, Field Trial Grids were intrusively investigated with Schonstedt magnetometers. Five identifiable MD items were located during the study, including two 81mm practice mortar projectiles, an M74 air burst projectile simulator, an M18 smoke hand grenade, and an

illuminating ground signal (Parsons, 2002a). In addition, approximately 129 fragments were found during the Field Trials.

One incidental MD item (rocket, 4.5-inch, practice, M17) was found by BLM in September 2008.

3.3.3 MRS-10B

3.3.3.1 MRS-10B Area Description and History

MRS-10B (Elliot Hill Region) is a 242-acre site east of Hennekens Ranch Road and west of Barloy Canyon Road (Figure 3-3). Vegetation at the site consists mostly (approximately 90 percent) of CMC, with some grasslands in the northern portion. A portion of this site has been transferred to BLM.

A combat range was identified on the western portion of this site in a 1945 training map, and a drop zone is shown in the northwest corner of the site in a 1956 training map (Army, 1945, 1956). A Vietnam Village was identified in the northwest corner (northeast of the former drop zone), and "MG Flats" (Machine Gun Flats) was identified in the central portion of this site on a 1972 training map (Army, 1972). Interviews conducted during the ASR indicate that, in the 1940s and 1950s (USAEDH, 1997a), soldiers were seen firing shoulder-launched projectiles and rifle grenades toward cliff faces and in canyons at the site.

3.3.3.2 MRS-10B History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-10B. Table A-3 contains a listing of the munitions, both MEC and MD, found during the munitions responses described below.

Due to the heavy vegetation density at MRS-10B, brush cutting and thinning was performed for access during UXB removal operations. A controlled burn was conducted in August 1997 to provide access for the USA SS/GS sampling, and surface and subsurface removal activities. During September 1994, a removal action of 35 grids (unknown grid size) to three feet bgs was conducted by UXB along the access roads in MRS-10B leading to MRS-19. A total of 771 small arms ammunition items and four MD items (ground illumination signals, and 20mm and 75mm – models unknown) were found during this action (UXB, 1995d).

Between September 1997 and December 1997, USA conducted SS/GS sampling in the MRS-10B in 58 100-foot by 200-foot SS/GS grids (approximately 11 percent of the land area). Depending on the number of anomalies encountered in a given grid, SS/GS sampling does not necessarily result in intrusive investigation of all anomalies detected. A total of 7 MEC (UXO and ISD) items and 8 MD items were removed during this sampling activity (USA, 2001d).

USA conducted subsurface MEC removal on a total of 286 100-foot by 100-foot grids (approximately 26 percent of the land area) in the northern portion of MRS-10B to a depth of one foot bgs between August 1998 and December 2000. A total of 197 MEC (UXO and ISD) items and 1,332 MD items were removed during this operation. Mark II hand grenades (practice and fragmentation), 40mm projectiles (practice and HE), rifle smoke grenades, 60mm mortar projectiles (practice and HE), 3-inch MK 1 practice trench mortar projectiles, and over 750 expended small arms ammunition items were identified during the munitions removal activities that occurred between 1998 and 2000 (USA, 2001d). Anomalies were investigated to a depth of one-foot. The 343 anomalies that were identified but not investigated deeper than one foot were documented. USA concluded that MEC likely exists at depths deeper than the one foot removal depth (USA, 2001d).

A site investigation, beginning in August 2001 as part of the BRA, identified five foxholes, 19 soil pits (depressions), 40 blank small arms casings, seven firing positions, and 32 MD items. MD consisted primarily of spent flares. Two 105mm gun turrets located at the site may have been used as targets. Foxholes that were identified are located in the northern section of the site (MACTEC/Shaw, 2012).

One incidental MEC item (Fuze, grenade, hand, practice, M205 series) was found by BLM in May 2000. One incidental MD item (grenade, riot control, civilian) was found by BLM in June 2001.

3.3.3.3 MRS-10B Restoration Work by BLM

In 2011, BLM conducted restoration of several areas within MRS-10B. These areas include 1.7 acres along Trail 61 (also known as the "Burmese" Trail) that runs between Hennekens Ranch Road and Barloy Canyon Road and 10.3 acres to the north and south of Trail 61. BLM coordinated the work with the Fort Ord BRAC office and the USACE OE Safety Specialist. All BLM workers had MEC recognition and safety training prior to field work and on-call construction support was provided by the OE Safety Specialist. BLM used heavy equipment to rip and recontour old Army roads and the associated gullies and compacted soil areas. This practice is intended to stabilize formerly gullied areas and soften up hardened soil areas to allow for better root penetration of the soil. Over 15,000 plants were planted in the restoration areas. No incidental MEC items were reported during the work (BLM, 2011 and 2012).

3.3.3.4 MRS-19 Area Description and History

MRS-19 (Rifle Grenade Range) consists of approximately 24 acres and is adjacent to and north of MRS-10B. Vegetation at the site is mostly CMC. MRS-19 was identified as a Rifle Grenade

Range. There also is evidence that this site may have been used for flame field expedient (FFE) or fougasse training (USAEDH, 1997a).

3.3.3.5 MRS-19 History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-19. Table A-3 contains a listing of the munitions, both MEC and MD, found during the munitions responses described below.

Due to the heavy vegetation density at MRS-19, brush cutting and thinning was performed for CMS sampling operations. Manual cutting of brush was conducted as required to create grid access.

One rifle grenade (model unknown) was found by HFA during gridding operations for surface sampling in September 1994 (HFA, 1994). The site was declared MEC contaminated by the USACE OE Safety Specialist. HFA did not sample grids at this site.

Twelve randomly located 100-foot by 100-foot grids (approximately 11 percent of the land area) were sampled to depth by CMS in June-July 1996, during which 111 small arms ammunition items, two MK II (ISD) fragmentation hand grenades, a rifle smoke grenade (UXO), and two ground illumination signal (ISD) were found. Some 37mm projectile fragments also were found (CMS, 1997b).

A site investigation conducted as part of the BRA in August 2001 identified three foxholes, three potential firing points, a soil pit (depression), four empty 55-gallon drums, and multiple MD items as shown in Table A-3 (signal flares, 40mm flares, grenade fuzes, hand grenade safety levers, smoke hand grenade, 40mm cartridge cases, "cap M10" [as noted in the original field notes], smoke pot, and a "3.5mm rocket fan" [as noted in the original field notes]). These items were removed from the site. The former contents of the 55-gallon drums were not identified (MACTEC/Shaw, 2009, updated 2012).

3.3.4 MRS-27I

3.3.4.1 MRS-27I Area Description and History

MRS-27I (Training Site 9) consists of 20 acres and is located completely within the boundaries of MRS-10A. The site is identified as Bivouac Area D on a 1972 training map (Army, 1972) and is identified as Training Site 9 on 1976 through 1987 range and training maps (Army, 1976 and 1987).

3.3.4.2 MRS-27I History of Munitions Responses

MRS-27I is located completely with the boundaries of MRS-10A and is evaluated in the MRS-10A discussion.

3.3.5 MRS-41

3.3.5.1 MRS-41 Area Description and History

MRS-41 is a one-acre site located completely within the boundaries of MRS-58 in the central portion of the former Fort Ord. MRS-41 was identified as a powder magazine within Combat Range 3, as shown on a Training Facilities Map (USAEDH, 1997a).

3.3.5.2 MRS-41 History of Munitions Responses

MRS-41 is located completely within the boundaries of MRS-58 and will be evaluated in the MRS-58 discussion. Four MD items (cartridge case, 57mm RR; cartridge, 40mm, signal; tail, rifle grenade; and fuze, projectile, powder, time, train, fuze [PTTF]) were found during subsurface munitions sampling (select grids to 4 feet below ground surface) in 1994 by HFA (HFA, 1994).

3.3.6 MRS-48

3.3.6.1 MRS-48 Area Description and History

MRS-48 is approximately 28 acres in size and is immediately east of MRS-19. Vegetation at the site is almost exclusively CMC. The site was identified on a 1945 Fort Ord Master Plan as a "Dummy Grenade Range" and is adjacent to a grenade training site, MRS-11, which is located next to MRS-48, east of the Area B boundary.

3.3.6.2 MRS-48 History of Munitions Responses

During a site inspection conducted by a USACE OE Safety Specialist, a 4.2-inch mortar projectile fragment was found. This discovery plus historical documents indicated the possibility of MEC at the site (USADEH, 1997a).

Due to the heavy vegetation density at MRS-48, mechanical vegetation removal was required for CMS SS/GS sampling operations. A towed rotary cutter was used to create grid access.

An SS/GS sampling program was completed at the site by USA in July 1998. USA removed brush and removed MEC and MD encountered in nine 100-foot by 200-foot grids (approximately 14 percent of the land area) to a depth of four feet to evaluate the general distribution, density, and types of MEC at the site. Depending on the number of anomalies encountered in a given grid, SS/GS sampling does not necessarily investigate all anomalies detected. Three MEC items

were recovered: a M205 series hand grenade fuze (UXO), a M17 series rifle parachute ground signal (UXO), and a 10-pound HC screening smoke pot (ISD). MD identified at the site include smoke hand grenades, white-phosphorus (WP) ground signals, 4.2-inch WP smoke mortar projectiles, 81mm mortar projectiles, and 105mm HE projectiles. USA concluded that a grenade and 4.2-inch mortar impact area existed within or near the site, and a grenade impact area existed close to, or within the site (USA, 2001c).

3.3.7 MRS-53 BLM

3.3.7.1 MRS-53 BLM Area Description and History

MRS-53 BLM is a nine-acre portion of southeastern end of MRS-53 that extends into the western boundary of BLM Area B (Figure 3-3). Vegetation at the site consists mostly of CMC, with some coast live oak woodland in the southwest. The property is undeveloped.

MRS-53 reportedly was used as a rifle grenade and shoulder-launched projectile firing range. Interviews with former Fort Ord personnel indicate that the hill west of MRS-53BLM was a target area for rifle grenades and ground/tube-launched projectiles in the 1940s, 1950s, and 1960s. The hill was reportedly assaulted by rifle grenades and shoulder-launched projectiles from the southeast. These interviews also revealed that the main target was a tank hull placed at the intersection of two unpaved roads west of the BLM Area B boundary (USAEDH, 1997a).

3.3.7.2 MRS-53 BLM History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-53 BLM. Appendix A contains a listing of the munitions, both MEC and MD, found during the munitions responses described below.

Due to the heavy vegetation density at MRS-53, mechanical vegetation removal was required for access to most of the USA sampling grids. Manual brush cutting techniques were incorporated to compliment mechanical operations in the woodland area.

Beginning in 1998, USA sampled five 100- foot by 100-foot sample grids (approximately 13 percent of the land area) to a depth of four feet (USA, 2001g). According to the Fort Ord MMRP database, one MEC item (a 37mm low explosive projectile [UXO]), numerous 37mm low explosive projectile fragments MD items, and a 2.36-inch practice rocket MD item were found during the investigation. Also identified in MRS-53, but not specified to be in MRS-53 BLM, were numerous MD items (simulator projectiles, airburst and fuzes, practice hand grenade) that appeared to have been buried or placed.

To address the potential explosive hazards associated with surface MEC potentially present in areas accessible to the public, a visual surface removal of MEC from accessible areas was

performed between December 2001 and February 2002, and covered approximately 25 percent of the land area. The survey area was limited by site access issues, due to dense vegetation in the area. No MEC was found within MRS-53BLM during the visual surface removal (Parsons, 2002b).

3.3.8 MRS-54

3.3.8.1 MRS-54 Area Description and History

The portion of MRS-54 that is located on the western edge of BLM Area B is approximately 58 acres in size (Figure 3-3). Vegetation at this site consists almost entirely of CMC. MRS-54 was split into two portions based on future use.

MRS-54 was identified based on interviews conducted with Mr. Fred Stephani, the former Fort Ord Fire Chief, as part of the ASR (USAEDH, 1997a). According to Mr. Stephani, the southernmost canyon was used for flame-throwers and also was a range for hand grenades, rifle grenades, shoulder-launched projectiles, and artillery. The ASR notes that the target area was to the east into the canyon, that targets were set up in the canyon, and that munitions were fired across Watkins Gate Road which cuts north-south through the center of the BLM Area B portion of MRS-54 (USAEDH, 1997a). Mr. Stephani indicated that the northernmost canyon included a firing point and range for hand grenades, rifle grenades, shoulder-launched projectiles, and artillery. He also stated "that the Fort Ord Fire Department had discovered artillery rounds in the canyon" (USAEDH, 1997a).

3.3.8.2 MRS-54 History of Munitions Responses

The ASR reported that a site reconnaissance was conducted by a USACE OE Safety Specialist in 1996 (USAEDH, 1997a). During the reconnaissance, MD items, including an expended 2.36-inch rocket, illumination signals, 81mm practice mortar projectiles, and portions of a 75mm shrapnel projectile, were found; however, this site walk also included the portion of MRS-54 that extends west of the BLM Area B boundary, and the locations of the MD were not specified, nor are they listed in the MMRP database.

USA conducted removal action activities at MRS-3 and MRS-53EXP, east of MRS-54, during 1998 and 1999 (USA, 2000f, 2001h). Several MD items were found on the MRS-54 western boundary, including firing devices, an 81mm mortar projectile, and igniters, time fuze, blasting. Between December 2001 and February 2002, Parsons conducted a visual surface removal limited to accessible trails and paths within the BLM area east of Parker Flats, which includes the BLM Area B portion of MRS-54. This operation did not include any vegetation removal operations or

foraging through brush and it covered approximately 25 percent of the land area. No MEC or MD items were found at MRS-54 (Parsons, 2002b).

MRS-54 was addressed during the 2010-2011 site assessment field activities (Shaw, 2012b). The site assessment consisted of a combination of random visual and technology-aided searches. The search paths were limited to trails and areas of less dense vegetation. No MEC or MD items were found at MRS-54 (Shaw, 2012b).

3.3.9 MRS-56

3.3.9.1 MRS-56 Area Description and History

MRS-56 (Hayrake Area) is approximately 68 acres and is on the western edge of BLM Area B, immediately north of MRS-54. Ground cover at this site consists almost entirely of CMC.

The site was identified based on interviews with Mr. Stephani who indicated that this site was a target area for machine guns, M-1 rifle grenades, smoke grenades, and shoulder-launched projectiles. The firing direction was to the southeast from behind the "hayrake" (a piece of farming equipment) (USAEDH, 1997a). The ASR notes that the site was used as a target area from the 1940s through the 1960s.

3.3.9.2 MRS-56 History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-56. Appendix A contains a listing of the munitions, both MEC and MD, found during the munitions responses described below.

As reported in the ASR, MRS-56 was surveyed during a site investigation as part of the PA/SI in 1996 (USAEDH, 1997a). During the investigation, MD items, listed as "expended signals" and "expended smokes" in the ASR, were found.

USA conducted a surface walk about in 1999, where two items, a M126 series illumination signal (ISD) and a M125 series illumination signal (MD), were found within and near the boundary of MRS-56 (USA, 1999).

To address the potential explosive hazard associated with surface MEC potentially present in areas accessible to the public, a visual surface removal of accessible areas was performed between December 2001 and February 2002. The surface removal included MRS-56 and was limited to trails and paths. No vegetation removal occurred during this operation; hence the areas covered amounted to approximately 25 percent of the total area surveyed, due to the density of vegetation. No MEC were found in MRS-56 during the visual surface removal (Parsons, 2002b).

This area was mapped in October 2001 as part of the BRA. Several blank small arms ammunition casings, one pit, one battery, and one fence post were mapped during the site reconnaissance. No evidence of munitions-related items was identified. It should be noted that access to the middle of the site was limited to trails and paths, due to very dense vegetation (MACTEC/Shaw, 2012).

MRS-56 was addressed during the site assessment field activities (Shaw, 2012b). The site assessment consisted of a combination of random visual and technology-aided searches. The search paths were limited to trails and areas of less dense vegetation. MD found in MRS-56 included (non-standard nomenclature is as presented in the Site Assessment Data Report – Shaw, 2012b): grenade, safety pin pull ring (model unknown); simulator, projectile, air burst, M74 series, casing; rocket, 2.36-inch, practice, M7, body (expended); projectile, 75mm, MK I, shrapnel (expended); grenade, hand smoke, safety lever (model unknown); signal, illumination, ground, M127A1 (expended); 81mm mortar, HE, fragments (model unknown); and grenade, rifle, smoke, fragment (model unknown).

3.3.10 MRS-58

3.3.10.1 MRS-58 Area Description and History

MRS-58 is approximately 173 acres in area and is located in the central portion of the former Fort Ord and north of the former Impact Area (Figure 3-3). MRS-58 is bordered to the west by Watkins Gate Road. Vegetation at the site consists of approximately 70 percent CMC, with some coast live oak woodland, grasslands, and coastal scrub.

Interviews with Mr. Stephani indicated this area included firing points and probably target areas for rockets (USAEDH, 1997a). As noted in the ASR, rifle grenades and shoulder-launched projectiles were fired from the east from foxholes along Watkins Gate Road. Mr. Stephani also identified firing points, direction of fire, and target areas for rifle grenades. This use reportedly occurred in the 1940s and 1950s. (USAEDH, 1997a)

Bivouac areas G and H are identified on the 1954 and 1958 Fort Ord training maps (Army, 1954, 1958). The same vicinity is identified as "Engineer Field Training" on a 1972 Army training map (Army, 1972). MRS-41 lies in the north-central portion of the site. On a 1945 training map (Army, 1945), the MRS-41 area was identified as "Powder Magazine" within Combat Range 3.

3.3.10.2 MRS-58 History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-58. Appendix A contains a listing of the munitions found during the munitions responses described below.

HFA conducted sampling in eight 100-foot by 100-foot grids in MRS-41, which is located within MRS-58, in 1994. Four MD items (cartridge case, 57mm RR; cartridge, 40mm, signal; tail, rifle grenade; and fuze, projectile, PTTF) were found by HFA (HFA, 1994). HFA initially reported that sampling occurred at MRS-09; however, it was later realized that the site where that work was conducted was actually within MRS-58, in the vicinity of MRS-41 (USA, 2001f).

In April 1996, a USACE OE Safety Specialist performed a site walk and found expended small arms blank ammunition and pyrotechnic items. The pyrotechnic items were identified as MD (USAEDH, 1997a).

USA conducted site walks in 1999 (USA, 1999) where they located and removed two 3-inch practice Stokes mortar projectiles and 60mm mortar projectile fins from the site. These items were identified as MD.

In March 2000, an M16 practice antipersonnel mine (MD) was found by BLM. It was documented as an incidental item.

This area also was investigated as part of the BRA conducted in December 2001. Located munitions-related features included two ordnance components. Three foxholes and six fighting position locations were encountered; however, no evidence of targets or other range features was identified. Additional items mapped during the site visit include a cement pad, a fenced area, and a signal corps symbol (MACTEC/Shaw, 2012).

A UXO item (flare, surface, trip M49 series) was found during a surface removal conducted in the BLM area east of Parker Flats MRA by Parsons (2002b).

A projectile, 60mm, mortar, illumination (MD) was found by BLM in 2005. It was documented as an incidental item.

MRS-58 was addressed during the site assessment field activities (Shaw, 2012b). The site assessment consisted of a combination of random visual and technology-aided searches. The search paths were limited to trails and areas of less dense vegetation. MD found in MRS-58 included (non-standard nomenclature is as presented in the Site Assessment Data Report – Shaw, 2012b) projectile, grenade, practice, 40mm, M781 (expended); 37mm projectile, fragment (model unknown); projectile, 3-inch mortar, practice, MK1, Stokes (expended); mine, antitank, practice (expended); and mortar, tail boom (model unknown). No MEC was found during the site assessment.

3.3.11 MRS-27G

3.3.11.1 MRS-27G Area Description and History

MRS-27G (Training Site 7) is located north of the former Impact Area and south of MRS-53 BLM (Figure 3-3). Vegetation at the site consists mostly of coast live oak woodland and about 15 percent grasslands.

Only the southeastern quarter (4 acres) of MRS-27G is in BLM Area B. The rest of the site was evaluated as part of the MRS-53 Expansion Area, which was included in the Parker Flats MRA Track 2 RI/FS (MACTEC, 2006).

A 1961 training and facilities map (USACE, 1961) and the 1967 Back Country Roads map (Army, 1967) identified the site as Bivouac Area E. 1976 and 1987 ranges and training maps identified the site as Training Site 7 (Army, 1976 and 1987).

3.3.11.2 MRS-27G History of Munitions Responses

The following describes the munitions responses that have been conducted at MRS-27G.

The northern portion of MRS-27G was investigated as part of MRS-53 Expansion Area, which was evaluated as part of the Parker Flats MRA Track 2 RI/FS. Portions of six grids that were part of the MEC removal operation at MRS-53 and MRS-53EXP in 1998 (subsurface to four feet bgs) are within the BLM portion of MRS-27G. No MEC or MD items were found during the subsurface MEC removal operations conducted by USA in 1998 within the 4 acres that are located within BLM Area B (USA, 2001i).

Parts of MRS-27G also were investigated in November 2001 as part of the BRA. No MEC was found during the BRA site reconnaissance (MACTEC/Shaw, 2012).

MRS-27G was addressed during the site assessment field activities (Shaw, 2012b). The site assessment consisted of a combination of random visual and technology-aided searches. The search paths were limited to trails and areas of less dense vegetation. No MEC or MD was found in MRS-27G.

3.3.12 MRS-27H

3.3.12.1 MRS-27H Area Description and History

MRS-27H (Training Site 8) is approximately 21 acres and is located mostly within MRS-16, with approximately six acres of the former training site extending west of MRS-16 (Figure 3-3). Vegetation in MRS-27H consists of approximately half CMC and half coast live oak woodland.

3.3.12.2 MRS-27H History of Munitions Responses

In 1985, one ISD item (a flash artillery simulator) was found by range control in the western portion of MRS-27H. A grenade, hand, riot CS, M7A3 (MD) was found in the western portion of MRS-27H during MRS-16 fuel break removal conducted by USA in June 1998 (USA, 2001j).

MRS-27H was addressed during the site assessment field activities (Shaw, 2012b). The site assessment consisted of a combination of random visual and technology-aided searches. The search paths were limited to trails and areas of less dense vegetation. No MEC or MD was found during the site assessment.

3.3.13 MRS-27.J

3.3.13.1 MRS-27J Area Description and History

MRS-27J is identified as a former training site of approximately 20 acres. The southern half of the site is located within the former Impact Area, and the northern half (7 acres) is located within MRS-10A and MRS-10B (Figure 3-3).

MRS-27J was listed as Training Site 10 on a 1984 training map (Army, 1984). Bivouac Area L was identified as being located at this site in 1967 (Army, 1967). Additionally, MRS-27J was identified as being located partially within the known distance range (Army, 1945) and a range fan depicted on a 1984 training map (Army, 1984).

3.3.13.2 MRS-27J History of Munitions Responses

As part of USA's 1995 through 2000 removal and sampling activities for MRS-10A, several items identified as MEC was found in MRS-27J. These items were found during the investigation of MRS-10A as discussed above and listed in the MRS-10A portion of Table A-3. No items were found during the USA 1997 Site Stat/Grid Stat sampling that took place in the portion of MRS-27J located in MRS-10B (USA, 2001d).

One incidental ISD item (M18-series smoke hand grenade) was found by BLM in 1999 and reported in the MMRP database as a MRS-10A item.

3.3.14 Areas In-Between BLM Area B MRSs

3.3.14.1 Areas In-Between BLM Area B MRSs Description

Areas within BLM Area B that are in-between designated MRSs are areas where no specific training is known to have occurred. These areas include approximately 395 acres north of MRS-10A and MRS-58 and approximately 173 acres west of MRS-58. Figure 3-3 shows the site walk activities conducted in the areas in-between MRSs. Figure 3-4 and the Table A-3 show and list items found in-between the MRSs.

3.3.14.2 Areas In-Between BLM Area B MRSs History of Munitions Responses

As reported in the ASR, in 1995 and 1996 site walks were conducted in MRS-10A and 10B as part of a PA/SI and extended beyond the northern boundaries of these MRSs (USAEDH, 1997a). Items found north of MRS-10A and 10B include signals, illumination, ground, M125 series (one MEC, one MD).

USA conducted a Surface Walk About in the area north of MRS-10A and MRS-58 between September and October in 1999 (USA, 1999). MD items found during the USA site walk included: 4-inch barrage (model unknown); fins, 60mm (model unknown); firing devices, multioption, M142, and pull, M1; flares, surface, trip, M49 series; fuzes, projectile, point detonating, M48 series; grenades, hand, smoke, M18 series; projectile, 3-inch, Stokes mortar, practice, MK1; projectile, 40mm, HE, M381; and other miscellaneous MD. No MEC were found.

MRS-10A and 10B removal actions were conducted in 1998 and 1999 (USA, 2001d, 2001e). Grids established during these removal actions extended beyond the western and northern boundaries of these MRSs (Figure 3-3). MEC items (UXO) found outside of the MRSs-10A and 10B boundaries include one projectile, 60mm, mortar, HE, M49 series; and 15 fuzes, grenade, hand, practice, M228. MD items found primarily include: numerous projectiles, 60mm, mortar, practice, M50 series; fuzes, grenade, hand, practice, M228 and M205 series; projectiles, 37mm, low explosive, MK I; signal, illumination, ground, M125 series; grenade, hand, practice, MK II.

Parsons conducted visual surface removal activities in January 2002 (Parsons, 2002b). Two MEC items (UXO) were found by Parsons during activities near the MRS-10A northern boundary (pot, 2.5lb, smoke, HC, screening; simulator, projectile, airburst, M74 series).

The site assessment field activities were conducted within the area outside of known MRS boundaries (Shaw, 2012b), primarily north of MRS-10A and MRS-58. One MEC item (rocket, 2.36-inch, high explosive anti-tank [HEAT], M6 [UXO]) was found about half way between MRS-10A and MRS-56. Twenty-eight MD items were found outside of the MRS boundaries, with almost no two items being alike. MD of projectiles (60mm, 75mm, 81mm, and 105mm), grenades, grenade fuzes, flares, rockets, signals, and simulators were found.

Five incidental MD items were found by BLM outside of MRS boundaries north of MRS-10A and MRS-58, three in 2000 and one each in 2003 and 2007. These included an Explosive Ordnance Disposal (EOD) training warhead, an antitank practice mine, a 10lb smoke pot, a 2.75-inch practice rocket, and a smoke hand grenade. One incidental DMM item (mine, antipersonnel, practice, M8 series) was found by BLM in 2013 between MRS-58 and MRS-09.

Items found south of MRS-54 and west of MRS-58, with the exception of one item, were found on the western boundary next to MRS-53. These include one incidental cartridge, 40mm MD

item that was found by BLM in 2007. Two other MD items (grenades, hand, practice, MK II) were found in 2000 by USA (USA, 2001i). One rocket, 2.36-inch, practice, M7 (MD) was found north of MRS-16 in 1999 by CMS (listed in MMRP data base; no report available).

3.4 MRS-16 – MRS Description

3.4.1 MRS-16 Description and History

Interim remedial action was conducted at MRS-16 in 2006-2008 based on the *Final Record of Decision, Interim Action for Ordnance and Explosives at Ranges 43-48, Range 30A and Site OE-16, Former Fort Ord, California* (Army, 2002a). The interim remedial action included vegetation clearance by prescribed burning, surface and subsurface MEC removal, and detonation of MEC using engineering controls.

MRS-16 includes approximately 81 acres located immediately north of the former Fort Ord Impact Area, between Eucalyptus and Parker Flats roads and bounded by Watkins Gate Road to the east (Figure 1-1). The boundaries for MRS-16 Interim Action site were established at existing paved roads in the Interim Action ROD (Army, 2002a). Within the ASR the site boundaries were smaller and encompassed only the immediate extent of the "bazooka practice" area shown on former Fort Ord training maps. Prior to the implementation of the interim remedial action, the site was surrounded by a temporary 6-foot high chain link fence with warning signs.

The site was identified as a World War II (WWII) era rocket range and as a "bazooka practice" area on Fort Ord Training Facilities maps dating from 1945 and 1946. Available training maps after 1946 do not identify the bazooka training area. According to Fort Ord Range Control, this range was probably used as an antitank rocket range during and shortly after WWII. Available information indicates that MRS-16 had been used for training and live fire exercises from approximately the 1940s until the time the base was officially closed in 1994. Practice and HEAT rockets and rifle grenades were used in the 1940s and possibly 1950s. The site was later used for a portion of time as an anti-armor training area (Shaw, 2009).

3.4.2 MRS-16 History of Munitions Responses

The following site characterization and munitions responses have been performed at MRS-16.

3.4.2.1 Interim Action RI/FS

Remedial alternatives were evaluated in the *Final Interim Action OE RI/FS for Ranges 43-48*, *Range 30A*, *Site OE-16* (Harding ESE, 2002). The Remedial Investigation documented the following previous activities at MRS-16:

- In 1991, during a controlled burn of land immediately adjacent (to the northeast) of OE-16 (a smaller area within MRS-16), numerous 2.36-inch rockets and rifle grenades were found, some of which contained HE filler. On the basis of this discovery, a recommendation was made to perform a MEC removal over the burned area. Approximately 1,000 rockets were removed as a result of this action. This report is not documented in an After Action Report but is based on interviews with range control personnel employed at Fort Ord at the time.
- In 1998, a 30-foot wide fuel break composed of contiguous 30 by 110-foot grids placed around the perimeter of the "bazooka training" area was subjected to a complete removal to a depth of four feet over each grid. MEC found during this removal included HE and practice 2.36-inch rockets; practice anti-tank mines; HEAT, practice, and smoke projectiles, 37mm projectiles, rifle grenades, grenade fuzes; and illumination signals.
- A portion of MRS-16 was investigated as part of the Field Trial Sites phase of the *Ordnance Detection and Discrimination Study (ODDS)* (Parsons, 2002a). Four 100- by 100-foot grids were investigated within MRS-16, referred to as Field Trial Site 4 and categorized as Site Type 4. The different types of items that were expected at the site included 2.36-inch and 3.5-inch rockets, various types of illumination munitions, and small arms.
- A TCRA of surface MEC in accessible areas was conducted in December 2001. GPS tracking points were recorded to determine areas covered during the TCRA. The operations did not extend into the Impact Area. A total of seven suspected MEC items were encountered during the limited surface removal. Of the seven suspected MEC items, five were detonated; two of the items were X-rayed and then determined to be MD. In addition, 514 pounds of MD were collected (not including the two suspected MEC items that were determined to be expended after demolition operations were completed). The MD that was encountered was comprised primarily of 2.36-inch M7 practice rockets.

Based on the Interim Action RI/FS and public comments on the Proposed Plan interim action remedies were selected. The selected remedies are documented in the *Final Record of Decision*, *Interim Action for Ordnance and Explosives at Ranges 43-48*, *Range 30A*, *and Site OE-16*, *Former Fort Ord*, *California* (Army, 2002a). The selected remedies for the IA sites are: (1) vegetation clearance via prescribed burning, (2) MEC remedial action via surface and subsurface MEC removal, and (3) detonation of MEC with engineering controls.

3.4.2.2 Interim Action Remedial Action

In October 2006, a prescribed burn was conducted at MRS-16. The prescribed burn was performed to remove vegetation to provide a safer environment for conducting MEC removal, for habitat management, and for fire fuel reduction (*Draft Final Prescribed Burn 2006 MRS-16 After Action Report Former Fort Ord, Monterey County, California* [Presidio of Monterey Fire Department, 2007]).

Following the prescribed burn, surface and subsurface MEC removals were completed at MRS-16. The work was performed in accordance with the *Final Work Plan, MRS-16 Munitions* and *Explosives of Concern Removal, Former Fort Ord* (Final Work Plan; Shaw, 2006a), and with the ROD (Army, 2002a).

Surface removal was performed over the entire site to remove MEC and surface debris. DGM was then conducted. Through a combination of towed array DGM and real time EM61 surveys, anomalies were identified and excavated in 359 grids. Subsurface removals were conducted in 23 additional grids using Schonstedt surveys. In total, subsurface removals were completed in 382 or 94 percent of the grids. MEC items were recovered between 0 inches and 48 inches below ground surface. A total of 271 MEC items were found and removed. MEC items primarily consisted of mines, antitank, practice, M1; rockets, 2.36-inch, HEAT, M6; and fuzes, grenade, hand, practice, M205 series. Approximately 57,500 pounds of MD was also removed (Shaw, 2009). A listing of items found is provided in Table A-4.

During the course of MEC removal operations at MRS-16, an area exhibiting very high density of subsurface anomalies was delineated from DGM results. This MRS-16 area consists of 24 grids equating to approximately 5.4 acres. Analog subsurface removal was conducted on a portion of the "saturated area." The "saturated area" also contains three rocket burial pits that have been horizontally delineated, but vertical delineation was not completed. Subsurface investigations in the "saturated area" also included several test trenches. Based on the work completed, it is unlikely that MEC could remain on the surface, but MEC may remain below the surface. A two-strand barbed wire fence has been constructed in a manner that surrounds the "saturated area" along existing trails for convenience, and government property signs have been placed. The purpose of this fence is to delineate the area in which subsurface removal was not completed.

Any intrusive activities within the "saturated area" should be accompanied by UXO support. The requirement for UXO support during intrusive activities has been coordinated with BLM and the regulatory agencies (Shaw, 2009).

In the remaining areas of MRS-16 (the majority of the site), surface and subsurface MEC remediation is complete, and the perimeter 6-foot chain-link fence has been removed. The results of the Interim Action at MRS-16 are described in *Final MRS-16 Munitions and Explosives of Concern Remedial Action Report*, *Former Fort Ord*, *California* (Interim Action RA Report; Shaw, 2009).

The Interim Action RA Report also included a post-removal MEC risk assessment for MRS-16. The areas where surface and subsurface MEC removal was completed scored an "A," or the "lowest risk," score for all potential receptors. The post-removal risk assessment results for the "saturated area" scored an "E," or "highest risk," score for all potential receptors. A summary of the risk assessment results for MRS-16 is provided as Tables 3-2 and 3-3.

3.4.3 MRS-16 Conclusions

The remedial action for MRS-16 was conducted according to approved work plans. The data collection and management processes were subject to both contractor quality control and USACE quality assurance. Based on the work conducted, it is considered unlikely that subsurface MEC remains in areas where subsurface clearance was completed. It is possible that subsurface MEC does remain, considering that the detection instruments are not 100 percent effective.

MEC may remain below the surface within the "saturated area." The area is considered safe for its intended reuse because a surface removal has been conducted and recommended institutional controls at the site include UXO support for intrusive activities (Shaw, 2009).

The Interim Action RA Report recommended that the Army institute the following management practices at MRS-16:

- Maintain the fence that marks the boundary of the saturated area,
- Provide MEC recognition training for BLM personnel and report any possible MEC items that are found in accordance with the site security program,
- Require UXO construction support for any intrusive activities in the saturated area, and
- Evaluate the site via the five-year review process.

Based on the completion of the Interim Action at MRS-16, remedial alternatives will be evaluated in the FS (Section 5.0) without further evaluation of the MRS (Sections 3.5 through Section 4.8).

3.5 Adjacent Areas

3.5.1 Parker Flats Munitions Response Area

Parker Flats MRA is located adjacent to and west of BLM Area B. The area of Parker Flats was purchased by the government prior to 1940 and was used for military training through the late 1980s. Subsurface MEC removal actions were conducted in several MRSs comprising the Parker Flats MRA. The Parker Flats MRA Track 2 RI/FS was prepared based on the evaluation of previous work conducted at the MRSs (MACTEC, 2006). Based on the RI/FS, a Record of Decision was signed in 2008 selecting land use controls as the remedy.

Training conducted at the Parker Flats MRA during the pre-1940s is not well documented on existing training maps. The types of training likely to have occurred would have included 37mm artillery training, and 60mm, 75mm, 81mm and Stokes mortar training during this period of time. The 37mm artillery training, and 60mm, 75mm, and Stokes mortar training may have continued into the early 1940s. The earliest available training map for Fort Ord is a 1945 training facilities map (Army, 1945). This map shows training areas throughout the installation but does not identify artillery training or any other specific training areas within the Parker Flats MRA boundary. In the 1950s the Parker Flats MRA was used as an infantry training area and included basic combat and advanced individual training (Army, 1957). Training activities identified within the Parker Flats MRA included bivouac areas, practice mortar training, Field Battalion Training, Squad Tactics, Squad Defense Area, Field Fortification Area training, and guard duty training. Training practices also apparently included 3.5-inch rockets, because expended practice 3.5-inch rockets (MD) were found within the Parker Flats MRA and were readily available beginning in the 1950s. Practice mortar training was still occurring in the area in the 1960s.

Large concentrations of practice and HE 81mm and 60mm mortar projectiles, mostly MD, have been identified in the eastern portion of the Parker Flats MRA, largely in MRS-3, and to a lesser degree all along the eastern boundary of the Parker Flats MRA that is contiguous with BLM Area B (Figure 3-4). Concentrations of 37mm projectile MEC and MD items were also identified in the eastern portion of the Parker Flats MRA.

3.5.2 East Garrison

The Future East Garrison MRA is located adjacent to and northeast of BLM Area B (northeast of MRS-48). This area is being evaluated by FORA under the ESCA. Information about the Future East Garrison MRA is summarized in *Final Group 4 RI/FS Work Plan, Future East Garrison MRA* (ESCA RP Team, 2010). East Garrison was purchased by the government in 1917 and designated as an artillery range. Known and suspected training sites in the vicinity of East Garrison include: Demolition Training and Hand Grenade Area; Mechanic Training Area;

Engineer Training Area "C"; and suspected impact area for Stokes trench mortars. FORA has provided the DGM and analog data collected by the ESCA Remediation Program during the remedial investigation in Parcel E11b.6.1 within the Future East Garrison MRA (FORA, 2014). This data was used to identify an area to the east of the Future East Garrison MRA to be included in the evaluation of BLM Area B.

3.5.3 Impact Area MRA

The Impact Area MRA, located immediately south and southwest of BLM Area B, consists of the 6,560- acre portion of the 8,000-acre historical Impact Area that is entirely within the NRMA and is designated as a habitat reserve in the Reuse Plan (FORA, 1997). Former land use included live-fire training with military munitions. Multiple firing ranges operated within the historical Impact Area, and weapon firing generally was directed toward the center of the historical Impact Area. Several investigations in support of, and independent of, the Fort Ord military munitions response program have been conducted within the Impact Area. These include sampling, TCRAs, road and trail clearance, clearances conducted to support of the establishment of fuel breaks, and Interim Actions.

Based on the Impact Area MRA RI/FS (MACTEC, 2007), a ROD was signed in 2008 selecting technology-aided surface MEC remediation, with subsurface MEC remediation in selected areas and land use controls. Prescribed burning was identified as the primary method of vegetation clearance (Army, 2008a). The Army has been conducting the remedial action within the Impact Area MRA since 2008.

3.6 Conceptual Site Model

CSMs incorporate information regarding the physical features and limits of the areas of concern (the site), nature and source of the contamination (in this case MEC), and exposure pathways (potential scenarios that may result in contact with MEC). The CSM is divided into the following sections for this report: training practices, identified reuse, nature and extent of MEC, and potential human exposure pathways for physical hazards.

3.6.1 Training Practices

As described in the Management Plan, the types of training identified within BLM Area B include general maneuvers training, bivouac training, land mine training, hand grenade training, rifle grenade training, rocket training (shoulder-launched projectile training), and mortar training.

3.6.1.1 Maneuver Area

A maneuver area may have included using the site for squad patrols. Infantry platoons and squads conduct three types of patrols: reconnaissance, combat, and tracking (Army, 1992). Each

patrol includes specific objectives using infantry troops, sometimes with engineer support, to gather information or conduct combat operations. Combat patrols would include the use of blank small arms ammunition and possibly pyrotechnics and smoke-producing items (e.g., signals, flares, and smoke grenades). Training sites that may have been used as maneuver areas were MRS-10A and MRS-10B.

3.6.1.2 Bivouac Area

Bivouac areas at Fort Ord were used for overnight training and field exercises. Twenty-six bivouac areas had been established by 1980 and are documented in Fort Ord Regulation 350-5. The storage of ammunition was not allowed within 100 feet of a bivouac area. Normally, only blank cartridges, simulators, pyrotechnics, and smoke items were allowed to be stored near bivouac areas. However, field storage of sensitive items, demolition materials, and small arms ammunition (other than blanks) was permitted if clearance was obtained from the division ammunition officer (Army, 1980). Ammunition holding areas were to be individually fenced with triple concertina wire or comparable fencing. Depending on the quantity of ammunition stored, an armed guard may have been required to maintain access control. According to Fort Ord Regulation 350-5, "Strict accountability will be maintained so that items cannot be buried or discarded to avoid returning unspent ammunition." To discourage the burial or discarding of unspent ammunition, ammunition was inventoried when checked out from the ammunition supply point (ASP), daily while stored in the field, and again when the unused ammunition was turned in at the ASP.

Fort Ord range regulations required that units be checked into and out of all bivouac areas. Joint inspections of the bivouac areas were conducted by the unit representative and a representative of Range Control before the bivouac area was released from unit responsibility. All tactical digging or holes were to be filled in and all wire removed. All garbage (wet or dry) was to be hauled to the sanitary landfill for disposal, or placed within dumpsters in the Main Garrison if the landfill was closed.

The garbage areas likely would have been marked with signs. It also is possible that field latrines were dug, treated with lime, and then covered with soil when a unit left the area. It is possible that prior to 1980, some unused munitions could have been buried on site. Although it is unlikely (for the reasons stated above) that unspent ammunition authorized for use in the bivouac areas would have been buried, the possibility that burial did occur does exist. If the burial of spent ammunition occurred, these items would not present a hazard if encountered. Training sites that may have been used as bivouac areas include MRS-27H, MRS-27I, and MRS-58.

3.6.1.3 Practice Land Mine Training

According to current field manuals, practice and inert (training) mines, or explosive booby trap simulators, are used to train personnel in the precautions and proper methods to be observed in the care and handling, arming, booby-trapping, and disarming of mines (Army, 1997). HE mines normally are not used in training, except for demonstration purposes.

Information in Army training manuals concerning emplacement of mine-fields serves as guidance as to how the site vicinity may have been used for mine and booby-trap training (Army, 1997 and 2001). Current training in mine warfare includes installation and removal of antipersonnel and anti-tank mines and anti-handling devices. Training also includes installation, recovery, or transfer of a hasty protective mine-field as well as emplacement of tactical mine-fields, and row, standard-pattern, and scatterable mine-fields. Training also includes breach of mine-fields (including use of explosives) as well as mine awareness training.

Based on the practices described in field manuals, it is likely the trainees would learn to mark mine locations as well as practice mine removal operations. It is also likely the trainees would practice clearing a path or lane through the mine-field by probing, marking, and possibly destroying the mines with explosives or grappling hooks. Training practices conducted prior to 1997 were likely to be similar to those described above. Based on available historical data, practice mine training occurred in and around MRS-09 and MRS-12.

3.6.1.4 Rifle Grenade Training

Review of available information indicates that rifle grenade training could have occurred in portions of BLM Area B.

Range configuration information for rifle grenade training was obtained from *Policies and Procedures for Firing Ammunition for Training, Target Practice, and Combat* (Army, 1983). Munitions descriptions for recent training rifle grenades were obtained from Technical Manual (TM) 43-0001-29; and information on World War II grenade launchers and information on the available World War II munitions was obtained from *The American Arsenal* (Hogg, 2001). According to the policies and procedures (Army, 1983), rifle grenades are fired from behind a protective barrier equivalent to a screen of sandbags 0.5 meters thick or reinforced concrete walls 0.16 meters thick. It is suspected that this would be simulated in the training area. According to information in The American Arsenal, the depth to which the launcher is inserted into the stabilizer tube determines the range attained by the fired grenade (Hogg, 2001). The maximum range of the practice rifle grenade M11 series (version found in TM 9-1985) is 260 yards; therefore, it is expected the training range would be at least 260 yards in length. Targets likely would be placed at various distances to practice firing at different ranges. Based on available

information, rifle grenade training may have occurred in canyons within MRS-12, MRS-19, MRS-53BLM, MRS-54, and MRS-56.

3.6.1.5 Hand Grenade Training

Based on available information, hand grenade training may have occurred within portions of BLM Area B. Hand grenade training areas usually consist of throwing bays or trenches and targets. According to current training manual FM3-23.30, the targets should include silhouettes in the open at 20 meters, a fortified mortar pit at 20 meters, a fighting position at 30 meters, and a trench target at 40 meters. Training would include practice in the proper way to hold and throw the grenade (Army, 2000). According to FM3-23.30, all soldiers must go through a mock-bay training before going through to the live bay. It is expected that historical hand grenade practices were similar to current/recent practices. Based on available information, hand grenade training may have occurred in MRS-12, MRS-10B, MRS-19, MRS-48, and MRS-54.

3.6.1.6 Mortar Training

Mortar training was reported to have occurred in MRS-48, MRS-54, MRS-10A, and MRS-10B. Items including 60mm and 81mm practice projectiles, and 4.2-inch white phosphorous smoke mortar projectiles were found onsite as MEC or MD. 81mm HE mortar projectiles were also found within MRS-10A and MRS-10B, indicating that HE mortar training was conducted at these sites.

The 81mm mortar was developed in the 1930s and improved on the earlier Stokes mortar design. The 81mm mortar projectile included tail fins, which provided stability to the projectile in flight. The M43 series, both HE and practice, were the most commonly found 81mm mortar projectile types found in BLM Area B North. The maximum range of the 81mm M43 series HE and practice projectile is approximately 4,050 yards (3,701 meters) (Army, 1994).

81mm training mortars (M68 series) had a maximum range of 311 yards (284 meters). The training projectiles were assembled by attaching a fin assembly that contained an ignition cartridge. The ignition cartridge, similar to a shotgun cartridge, was used to propel the inert portion of the projectile. If the ignition cartridge failed to function, the projectile would not be fired; therefore, it would not be possible for a live practice mortar projectile to be found downrange as a result of firing. The training projectiles were reusable and could be collected and reused by inserting a new ignition cartridge.

The 60mm mortar is an easily portable weapon ideally suited for firing distances that fall between the range of the 81mm mortar and the hand grenade. The M50 series practice projectile were the most commonly found 60mm mortar projectile type found in BLM Area B North. The

M50 series practice projectile simulates the weight and ballistic performance of the M49 HE projectile, which had an effective range of approximately 1,000 yards (Hogg, 2001).

The 4.2-inch (107mm) projectile was the largest mortar cartridge used by US forces during the period Fort Ord was active. It is unique in that it is spin-stabilized in flight. Types of 4.2-inch mortar cartridges found at Fort Ord include HE, smoke-white phosphorous (SMK-WP), and illuminating (ILLUM). Numerous smoke-white phosphorous M328 series projectiles (MD) were found at MRS-48, indicating mortar training was conducted at this site. The maximum range of the 4.2-inch mortar varied based on the projectile. The maximum range of the 4.2-inch, M2, Smoke, WP was 5,043 yards (4,610 meters). The maximum range of the 4.2-inch, M329A2, HE was 7,217 yards (6,600 meters).

3.6.1.7 Subcaliber Artillery and Mortar Training

A subcaliber artillery and mortar training range was designed for training in a smaller area to simulate actual use. Range P-5 was designated for subcaliber artillery and mortar training. Available information indicates that MRS-14D was previously identified as Range P-5. According to the standard operating procedure (SOP) for Range P-5, the range contained 11 firing points and had a maximum range of 730 meters (Army, 1992). Information from the SOP indicates that 14.5mm subcaliber and 22mm subcaliber mortar devices were authorized for use on the range.

The 14.5mm subcaliber projectile is used with a M31 Artillery Trainer. After the cartridge is fired, the heat of the propellant gases ignites the delay element. The delay element burns and ignites the smoke composition. The pressure produced by the burning filler then ruptures the plastic closing disc at the base of the projectile and a visible puff of smoke is produced (Army, 1983). Based on review of SOP, it is possible that unexploded projectiles could be present following firing (Army, 1994b)

The 22mm subcaliber practice cartridge is used with the 60mm and 81mm mortar training devices. The cartridge is used to provide realistic mortar firing training at distances which correspond to range firing distances in the ratio of one to 10. Based on review of the Military Munitions Database, the M744 cartridge was used at Range P-5. The 22mm subcaliber projectile, M744 has a maximum effective range of 195 meters. The 22mm subcaliber practice cartridge, M744 is comprised of a steel-bodied projectile which is assembled to a cartridge case containing a propelling and ejection charge. The projectile is flattened at the tip and contains a percussion piece assembly and smoke charge. On impact, the 22mm projectile functions and

produces a yellow cloud of smoke and an audible sound. It is possible that unexploded projectiles could be present downrange (Army, 1994b).

3.6.1.8 Rocket Training

Rocket (shoulder-launched projectile) ranges include an impact area, ricochet areas to the side of and behind the impact area, secondary danger zones located outside of the ricochet areas and designed to contain fragments from items exploding or ricocheting on the right or left edge on the far edge of the impact area, and the area immediately to the rear of a weapon that may be endangered by the effects of the weapon being fired. 2.36-inch rockets were used throughout World War II and were replaced by the 3.5-inch rockets at the end of the war. Minimum distance to impacts for these rockets is 250 meters, and range length from firing point to the end of the impact area is 950 meters (Army, 1983). Based on available information, rocket training (shoulder-launched projectile training) could have occurred at MRS-53BLM, MRS-54, MRS-56, and MRS-58.

3.6.2 Nature and Extent of MEC and MD in BLM Area B

This section discusses the nature and extent of MEC and MD in BLM Area B. With the exception of portions of BLM Area B that have undergone removal or sampling, dense vegetation has limited the ability to investigate and sample much of the western portion of BLM Area B North. Removal actions have taken place at MRSs-12, 14D, and 21 in BLM Area B East. In BLM Area B North, removal actions have taken place over the extent of MRS-10A and the northern portion of MRS-10B. SS/GS sampling was conducted in the southern portion of MRS-10B and in MRS-48. Randomly located grids were sampled in MRS-19. Selectively located grids were also sampled in MRS-09 and MRS-53BLM. Investigations of the remainder of the western portion of BLM Area B North largely have been limited to site walks (visual and instrumented) in accessible areas such as along trails and roads.

To evaluate the potential presence of MEC, BLM Area B has been subdivided into eight nature and extent sub-areas (Figure 3-5). The subdivision into these sub-areas is based on training uses and the level of previous munitions responses conducted in their respective areas. The acreages of sub-areas have been rounded to the nearest acre in the discussion below, and addition of the rounded acreages do not match the site total shown in Section 2.1.1.

Sub-area B-1 is approximately 110 acres located within the northwestern portion of BLM Area B, west of the Known Distance Range western boundary and includes the northern portions of MRS-56 and the northeastern portion of BLM Area B outside of the MRS boundaries (Figure 3-5). The northern and southern boundaries of sub-area B-1 were based on the transition area from

the site assessment (Shaw, 2012b) between proposed Track 1 and Track 2 areas established based on the EM61 transect data. Training in the MRS-56 portion of sub-area B-1 may have included machine guns, rifle grenades, smoke grenades, and shoulder-launched projectiles. Sub-area B-1 has been traversed by visual and technology-aided site walk investigations and EM61 transects. These site walks, while fairly extensive, were largely limited to existing trails. Intrusive investigation of anomalies was conducted for the EM61 transect data and MD items were found. No additional sampling was conducted. Only one MEC item (a ground illumination signal) was found along the northern boundary of MRS-56 in sub- area B-1.

Sub-area B-2 is approximately 143 acres located in the southern portion of MRS-10B. The northern boundary of this nature and extent area is based on the limits of the removal action conducted in the northern portion of MRS-10B, and SS/GS sampling grids south of MRS-19 and MRS-48. The northern boundary of sub-area B-2 is further defined by terrain features (ridges and cliffs). Training activities in sub-area B-2 included bivouac and maneuver training. Interviews in the ASR indicated that firing points for shoulder-launched projectiles and rifle grenades may have been located in sub-area B-2; however, no evidence of these types of training was found in sub-area B-2. Vegetation was removed via prescribed burning and SS/GS sampling was conducted within sub-area B-2; two MEC items (one grenade fuze and one pyrotechnic item) were found during this sampling. No MEC items were found during site walks conducted within sub-area B-2. One incidental grenade fuze (UXO) was discovered by BLM in 2000. All three MEC items found in sub-area B-2 are pyrotechnic and practice items consistent with bivouac and maneuver training uses. While the western portion of sub-area B-2 falls within the Known Distance Range, projectile items were not found during removal action in the area immediately west of sub-area B-2 (eastern portion of MRS-10A). Additional information about sub-area B-2 is ascertained from BLM's restoration work within the sub-area of 1.7 acres along Trail 61 (also known as the "Burmese" Trail) that runs between Hennekens Ranch Road and Barloy Canyon Road and 10.3 acres to the north and south of Trail 61. No incidental items were reported during the intrusive work required to recontour the former roads and gullies.

Sub-area B-2A is approximately 74 acres and includes MRS-19, MRS-48, and the northeast portion of MRS-10B. The southern boundary of this nature and extent area is extended into MRS-10B based on MEC items (grenade and pyrotechnic) found and removed from SS/GS sampling grids in northern portion of MRS-10B. Hand grenade training was reported to have taken place in MRS-19 and, hand grenade and rifle grenade training in MRS-48. Ten MEC and ISD (assumed to be MEC) items (mostly grenade and illumination related items) were found during random grid sampling and SS/GS sampling conducted in MRS-19 and MRS-48. Also, numerous 4.2-inch white phosphorous mortar MD items were found in MRS-48.

Sub-area B-3 is approximately 718 acres and includes MRS-09, MRSs-27G and 27H, MRS-53BLM, MRS-41, MRS-54, the southern portion of MRS-56, the northern portion of MRS-58, and the remaining areas outside of MRS boundaries within BLM Area B. Sampling was conducted in MRS-09 and MRS-53BLM. Bivouac areas are shown on historical training maps for MRS-58 and the MRS-41 area was identified as "Powder Magazine" within Combat Range 3. Investigation activities conducted in sub-area B-3 were limited because of lack of historical evidence of training activities in the sub-area and those conducted were limited to site walks (visual and technology-aided) along trails, existing roads, and paths due to dense vegetation. Limited information is available regarding potential presence of MEC in MRS-54 and the area south of MRS-54. Although more data are available for MRS-56, MRS-58, and the area north of MRS-58, visual and technology-aided site walk investigations at these sites were also limited to existing trails, and no sampling was conducted. Thus they do not represent statistically-based transects or grid layouts, and the items found during these investigations may not necessarily represent the true density of MEC potentially present. Two MEC items were found during sampling activities at MRS-09. One MEC (37mm projectile) was found at MRS-53BLM. One MEC item (2.36-inch rocket, HEAT, M6) was found during the site assessment. One MEC item (DMM) was found by BLM in 2013 between MRS-58 and MRS-09 (mine, antipersonnel, practice, M8 series). Heavy concentrations of MEC were removed from the Parker Flats MRA west of sub-area B-3 and in MRS-10A east of sub-area B-3, indicating potential presence of similar types of MEC in sub-area B-3. Remedial investigation data collected by the ESCA Remediation Program in the Future East Garrison MRA indicates MEC were recovered from a parcel east of sub-area B-3. However, as previously discussed, potential density of MEC is unknown because of limited data.

Sub-area B-3A is approximately 62 acres and consists of the southern portion of MRS-58. The northern boundary of B-3A was established along existing trails that are south of the mortar projectile MD found within MRS-10A to the east. Interviews conducted during the ASR indicated that this portion of MRS-58 may have been used as a target area for shoulder-launched projectiles and rifle grenades, but no items of that type were found. This sub-area has been traversed by visual and technology-aided site walk investigations. No MEC items were found within sub-area B-3A.

Sub-area B-4 is approximately 345 acres and consists of MRS-10A and the northern portion of MRS-10B. A 1945 training map identifies MRS-10A to be within "Combat Range 2." The majority of sub-area B-4 is also within the Known Distance Range that has been described as having an "advancement line" that was associated with the firing of mortars along with the advancement of troops (USA, 2001e). Surface removal was conducted in the southern portion of

MRS-10A. Subsurface removal to one foot was conducted in the northern portions of MRS-10A and 10B, and the southeastern portion of MRS-10A. More than 400 MEC items were found (mostly 60mm, 81mm, and 3-inch Stokes mortar projectiles).

Sub-area B-5 is approximately 43 acres and consists of MRS-12 and MRS-21. According to interviews, MRS-12 was "used as a firing point and target area for mortar projectiles, rifle grenades, and shoulder-launched projectiles" (USAEDH, 1997a). MRS-21 was identified during the ASR as potentially being a dumping ground for munitions. In addition to sampling, surface removal and subsurface removal to a depth of one-foot removal was conducted in MRS-12. Subsurface removal to a depth of four feet was conducted over the western portion of MRS-21. Visual surface removal up to the edge of Mudhen Lake and removal to one-foot along trails was conducted over the eastern portion of MRS-21. More than 25 MEC items were found at MRS-12 (primarily hand grenade, and flare and illumination items), and more than 65 MEC items were found at MRS-21 (multiple items, such as flares and fuzes were found at single locations).

Sub-area B-6 is approximately 100 acres and consists of MRS-14D. MRS-14D is located in what was Range P-5. Range P-5 was used for 14.5mm and 22mm subcaliber training. MEC operations at MRS-14D included sampling and surface and subsurface removal actions to a depth of four feet. The removal action included expansion grids to the south and east (within MRSs-14B and 14E), which are included in sub-area B-6. Approximately 24,000 MEC items were found and removed, the bulk of which were 14.5mm and 22mm subcaliber items. An additional 20,000 items were reported as ISD and conservatively are assumed to have been MEC.

3.6.3 Identified Reuse

BLM Area B is mostly undeveloped land. The Reuse Plan (FORA, 1997) identified the proposed future use to include habitat conservation and protection. The parcels (F1.1 through F1.3) within which BLM Area B is located are classified as the NRMA. The NRMA includes areas designated as conservation areas and habitat corridors important to HMP plant and wildlife species. Further, in 2012, current and future BLM lands at the former Fort Ord, including BLM Area B and MRS-16, were designated as the Fort Ord National Monument.

BLM Area B primarily consists of BLM lands (Parcel F1.3 has not yet been transferred to BLM) currently open for public use for recreation purposes, such as hiking and mountain biking. Public use of the property is generally confined to established roads and trails. BLM personnel maintain the property. Activities include management and maintenance of roads and trails, habitat enhancement, and monitoring of habitat. Future use is anticipated to be similar to current use.

3.6.4 Potential Exposure Pathways

Based on the current and anticipated future reuse of BLM Area B, potential receptors were identified. It is possible that the receptors identified below could come in contact with MEC present at the site. A brief description of each of the potential exposure pathways related to the receptors is presented below.

3.6.4.1 Surface-only Receptors

Surface-only receptors are not expected to intrude below the ground surface. This receptor group includes firefighters conducting prescribed burning; habitat monitors performing surface only activities, such as plant counts and monitoring of animal species and invasive weed control through spraying; and public users engaged in recreational activities such as hiking and habitat viewing. The surface-only receptor could be on site as often as 7 days per week and spend 6 hours per day or more on site. The surface-only receptor could come in contact with MEC remaining on the surface in the course of engaging in the above activities.

3.6.4.2 Intruding Receptors

Intruding receptors could intrude up to 5 feet bgs. This receptor group could include maintenance workers (weed abatement, trail maintenance) or construction workers (performing earth moving associated with trail maintenance or construction). Firefighters performing earth moving associated with responding to wildfires are also expected to intrude to 3 feet bgs. The maintenance workers could be on site as often as 7 days per week and spend up to 8 hours per day or more on site. Firefighters would be expected to be on site for a shorter period of time.

3.7 Site Evaluation

The available data (e.g., archival, site walk, sampling, and removal data) regarding BLM Area B were reviewed and evaluated according to procedures described in the *Final Plan for Evaluation of Previous Work* (HLA, 2000a) and Track 2 DQOs TM (MACTEC, 2003). The evaluation process is documented through the completion of a series of checklists. These checklists are organized in line with the nature and extent sub-areas introduced in Section 3.6.2. A set of checklists evaluating archival data, site walk data, and sampling data was prepared for those sub-areas that have not undergone removal action. These sub-areas include B-1, B-2, B-2A, B-3, and B-3A. Checklists evaluating archival data, sampling data (when appropriate) and removal data were prepared for sub-areas B-4, B-5, and B-6. These checklists are provided as Appendix C. This section presents a summary of the results of the checklist evaluations. It is divided into two subsections: 1) an assessment of sub-areas where removal actions have not been conducted, and 2) sub-areas with completed removal actions.

3.7.1 BLM Area B Sub-Areas B-1, B-2, B-2A, B-3 and B-3A

3.7.1.1 Literature Review

This section presents a summary of the literature review for sites where removal actions have not been conducted. It includes a summary of the literature review, an evaluation of the subsequent use of each sub-area, and an evaluation of establishment of site boundaries.

3.7.1.1.1 Literature Review - Historical Use

Based on interviews provided in the 1997 ASR (USAEDH, 1997a) and review of training maps and aerial photographs, several training areas were identified within BLM Area B. Sub-area B-1 (the MRS-56 portion) was reported to have been a target area for machine guns, rifle grenades, and shoulder-launched projectiles. Sub-area B-2 may have included maneuver areas and firing points for shoulder- launched projectiles and rifle grenades. Sub-area B-2A includes a rifle grenade range (MRS-19), and dummy grenade training (MRS-48) and both training activities appear to have extended into the northeast portion of MRS-10B. Sub-area B-3 includes mine and booby-trap training (MRS-09), a powder magazine (MRS-41), shoulder-launched projectiles and artillery training (MRS-53 and MRS-54), general training and bivouac areas (MRS-27G and MRS-27H), and firing points and target area for rockets and shoulder-launched projectiles (MRS-56 and MRS-58). Sub-area B-3A includes firing points and target area for rockets and shoulder-launched projectiles (MRS-58). The types of munitions that might be expected based on this type of training include practice landmines and booby traps, practice and potentially HE hand grenades and rifle grenades, shoulder-launched projectiles, and shoulder-launched rockets. Mortar projectiles and other artillery munitions could be present related to the combat training ranges.

3.7.1.1.2 Literature Review - Subsequent Use of the Area

BLM Area B is undeveloped. Some habitat restoration and transportation and trail network repairs, and erosion control work has been recently conducted within Sub-area B-2A. During use and management of areas included in BLM Area B, including restoration activities conducted in Sub-area B-2A, very few MD items have been found by BLM. MD items found include signal, illumination ground. Additional restoration activities are planned in the remainder of BLM Area B.

3.7.1.1.3 Literature Review - Establishment of Site Boundaries

The boundaries of MRSs in this group of sub-areas that have not undergone removal action were initially established as part of the archive search process and were based on areas that were identified on training facilities maps or locations where training was reported to have occurred.

The northern boundary of BLM Area B was based on the site assessment investigation (Shaw, 2012b). Evaluation of data from the ESCA Remediation Program's munitions response activities in the Future East Garrison MRA (FORA, 2014) resulted in an addition of a 31-acre area west of Barloy Canyon Road and south of Trail 16. Based on the literature review no changes to the boundaries of these MRSs are warranted.

3.7.1.2 Site Walk Review

This section describes the items that were found during site walks and how these items support historical information concerning past use of the site. Site boundaries are assessed based on the items found. There is also a discussion regarding equipment used during site walks, where appropriate, as well as quality control measures.

3.7.1.2.1 Site Walk Review - Results

Site walks within sub-areas that have not undergone removal action were completed as part of the ASR PA/SI (USAEDH, 1997a), USA surface walk about (USA, 1999), Parsons surface removal (Parsons, 2002b), the Basewide Range Assessment (MACTEC/Shaw, 2012), and the site assessments (Shaw, 2012a, 2012b). During these site walks, MD and MEC identified included practice artillery and mortar projectiles, smoke grenades, 2.36-inch rockets, and MD from HE mortar and artillery projectiles.

As part of the site assessment, in addition to site walks in accessible areas, five meandering technology transects were investigated using Geonics EM61, and all subsurface anomalies were investigated, near the northern boundary of BLM Area B. The EM61 transects identified multiple MD items and one MEC item. An M6 2.36-inch HEAT rocket (MEC) was found in the southernmost transect, located in sub-area B-3. MD items identified and found mostly in the more northern transects (north of MRS-54) included three grenade safety pins, one fragment from a 105 mm HE projectile, one M49 parachute trip flare holder, and one smoke grenade and tail fins from an 81mm HE mortar. Items found further south included additional 81mm HE mortar tail fins, an expended 75mm MK 1 Shrapnel projectile, a M7 2.36-inch rocket body, a M74 air burst projectile simulator, and a PTTF 75mm M1907 fuze.

3.7.1.2.2 Site Walk Review - Boundary Review

Based on the results of site assessment, the Site Assessment Data Report (Shaw, 2012b) delineated a proposed Track 1 area, proposed Track 2 area, and a transition zone in between the two. The transition zone was incorporated into BLM Area B for evaluation under this RI/FS. Rationale for the boundary location was based on survey data (EM-61 and Schonstedt) and MEC and MD findings during the site assessment. The remaining site boundaries are based on

evaluation conducted in the *Remaining RI/FS Areas Management Plan*. No changes to the boundaries of BLM Area B were proposed based on review of the site walk data.

3.7.1.2.3 Site Walk Review - Quality Assurance/Quality Control

QA/QC associated with the five different phases of site walks is described below.

PA/SI Site Walks

The site walks conducted as part of the PA/SI reported in the 1997 ASR were performed in accordance with PA/SI guidance (USAEDH, 1997a). The site walks were conducted to look for evidence of past munitions use. Visible evidence found during the site walks provided information on the type, extent, and magnitude of the munitions present. Physical features that may be present at a former site include impact craters caused by penetrating munitions, the presence of MEC or MD on the ground surface, and soil staining associated with the use of bulk explosives.

Basewide Range Assessment

Although not formally part of the MMRP, many of the DQOs identified in the site assessment phases of the BRA are the same DQOs established for the site assessment phase described in the Management Plan (Shaw/MACTEC, 2010). The DQOs for the BRA and the Management Plan identify similar inputs to the decisions used to answer questions regarding historical site use and to define boundaries of the area of use. The BRA site walks were conducted in accordance with the DQOs and procedures presented in the *Basewide Range Assessment Work Plan and Contractor Quality Control Plan, Small Arms and Multi-Use Ranges, Fort Ord, California* (Harding ESE/IT, 2001). The results of the BRA site assessments are presented in the *Final Comprehensive Basewide Range Assessment Report* (MACTEC/Shaw, 2012).

USA Surface Walk About

USA conducted visual surface walks in areas north of MRS-10A, MRS-10B, and MRS-58. The work conducted was visual site inspection without the use of technology. QC inspections were not described in the letter report documenting the USA surface walks (USA, 1999).

Parsons Visual Surface Removal

Parsons conducted non-instrument aided visual surface removal activities largely in the densely vegetated areas of BLM Area B North. These consisted of walking through any path available in the vegetation. After visual surface removal was completed, a visual QC inspection that covered at least 10 percent of the area cleared was performed (Parsons, 2004a).

Site Assessment

The site assessment included both technology-aided site walks using a Schonstedt GA-52Cx magnetometer, transects using an EM61 MK2A, and visual site walks that were completed according to the DQOs and site walk requirements specified in the Management Plan (MACTEC/Shaw, 2010). QA/QC activities for this project consisted of both instrument checks of magnetometers and GPS equipment completed on a daily basis and field QA/QC.

Instrument checks included the following daily checks:

- Calibration and maintenance of instruments, both the Schonstedt GA-52Cx magnetometer and Personal Digital Assistant.
- Daily pre- and post-operation navigation equipment (GPS) testing to ensure navigational precision within manufacturer's specifications.
- The Geonics EM61-MK2A was tested daily for instrument warm up, instrument operator(s) metal check (ensure no metal present on data acquisition personnel), cable shake test, static position system check, static background geophysical sensor check, static spike geophysical sensor check, dynamic geophysical sensor check, known location check (occupation of survey monument or grid corner), and repeat data collection.

Other QA/QC procedures included field QA/QC inspections by the Contractor Quality Control System Manager, UXO Safety Officer, and the USACE OE Safety Specialist; and field inspections and reviews of mapping activities were conducted on a daily basis by a representative from MACTEC. In addition, the UXO Safety Officer and OE Safety Specialist were notified about mapped features that needed further investigation, and they assisted with the confirmation and identification of site features and anomalies identified with the Schonstedt GA-52Cx and Geonics EM-61 MK2A. Field and data QA/QC inspections did not identify the need for corrective actions or process changes (Shaw, 2012a, 2012b).

3.7.1.3 Sampling Review

This section summarizes the results of sampling conducted at sub-areas B-2 (southern MRS-10B), B-2A (MRS-19, MRS-48, and the northeast portion of MRS-10B), and portions of B-3 (MRS-09, MRS-41, and MRS-53BLM). The site boundaries are also assessed based on the sampling conducted and the types of items found during sampling. An assessment of the equipment used and the quality control measures used during sampling is also discussed in this section.

3.7.1.3.1 Sampling Review - Results

Based on review of the sampling results, both HE and low explosive (LE) items were detected and removed during sampling within BLM Area B non-removal sub-areas. Items found during sampling in sub-area B-2 include two MEC items (one grenade fuze and one pyrotechnic item). Ten MEC items were found in sub-area B-2A, mostly grenade and illumination items. Numerous 4.2-inch white phosphorous mortar projectile MD items were also found in sub-area B-2A. Items found as MEC or MD in the MRS-09 and MRS-53BLM portions of sub-area B-3 included 81mm and 60mm HE and practice mortar projectiles, 37mm projectiles, 2.36-inch HE and practice anti-tank rockets, and numerous signals. The types of items were generally consistent with the types of training identified on historical training maps and identified in interviews conducted as part of the archives search and are consistent with the Army use of the property from 1917 until base closure in 1994. The results of the sampling suggest the possible presence of target areas for 37mm projectiles (MRS-53BLM) and mortar projectiles (MRS-09).

3.7.1.3.2 Sampling Review - Boundary Review

Based on review of sampling data, there is no indication that the boundary of BLM Area B should be revised.

3.7.1.3.3 Sampling Review - Equipment Review

MEC site walks and sampling activities included use of Schonstedt Model GA-52C, GA-72Cv, and GA-52Cx magnetometers. The site assessment also used a Geonics EM61 MK2 for digital geophysical mapping.

Schonstedt Model GA-52C, GA-72Cv, and GA-52Cx magnetometers

Schonstedt Models GA-52C or GA-72Cv magnetometers were used prior to October 1994, and Schonstedt Model GA-52Cx was used after October 1994. The Schonstedt magnetometers are passive dual flux-gate magnetometers that are highly sensitive magnetic locators that detect ferrous (iron) metal objects; however, they cannot detect non-ferrous metal objects (e.g., lead, brass, copper, and aluminum). Magnetometers make passive measurements of the earth's natural magnetic field; ferrous metal objects and rocks are detected because they produce localized distortions (anomalies) in the magnetic field. The Schonstedt magnetometers actually detect slight differences in the magnetic field (the "gradient") by means of two sensors mounted a fixed distance apart within the instruments' staffs. Because the magnetic response decreases greatly even over a short distance, a gradient magnetometer like the Schonstedt GA-52Cx is especially sensitive to smaller, near-surface ferro-metal objects (Breiner, 1973).

The Schonstedt magnetometers are hand-held devices that, when properly adjusted, will emit a distinctive tone when placed near a ferrous metal object; the volume and pitch of this tone can provide an experienced operator with qualitative information about the nature (e.g., size, location, subsurface depth) of the detected object. It should be noted, however, that Schonstedt magnetometers also will respond to soil and rock containing ferrous minerals ("hot rocks"). It should also be noted that asphalt pavement may contain enough ferrous mineralization to produce a Schonstedt response, which can mask the response from potential MEC items. Accordingly, it is recognized that the interpretation of the Schonstedt magnetometer response can be subjective; for deeper targets especially, the operator often must analyze a subtle change in the audio output and decide whether the magnetometer is responding to a potential MEC item or to pavement or soil mineralization. Additionally, it can be difficult to determine the exact location of a more deeply buried object because the Schonstedt's audio response may be dispersed over an area that is several feet wide.

The Schonstedt magnetometer is a so-called analog device that does not itself record (save) any data; typically, the location of a detected object (a "hit") is marked in the field or promptly excavated to uncover the detected object. For that reason, Schonstedt surveys are sometimes called "mag and flag" or "mag and dig" surveys.

The performance of the Schonstedt GA-52C, GA-52Cx, and GA-72Cv magnetometers was evaluated as part of the Ordnance Detection and Discrimination Study (ODDS) (Parsons, 2002a). The studies evaluated:

- Instrument signatures of inert munitions items suspended in air at varying orientations and distances from the geophysical sensor (static tests).
- The ability of various geophysical instruments to detect and discriminate between different munitions items buried at various depths (seeded tests).
- Geophysical instrument performance at actual MRSs (field trial site testing).

The Schonstedt tools were not evaluated during the static tests; therefore, only the seeded test results and the field trial tests are discussed herein. It is recognized that the ODDS study areas may not represent the same field conditions as BLM Area B, therefore, differences in field conditions, if applicable, should be considered when using information from the ODDS.

As part of the ODDS, non-penetrating items (ODDS Category I) were evaluated as were penetrating items (ODDS Categories II through X). Categories I through X classified OE items based on calculated penetration depths of the items in sand. Categories are identified with a roman numeral equal to the maximum penetration depth plus one foot. An item with a penetration depth of 0.6 feet would have one foot added to this depth for a total of 1.6 feet and

placed in Category II. ODDS Categories I, II, III, IV, and V seeded test results were used for comparison purposes in evaluating the performance of the geophysical equipment used in identifying surface and subsurface munitions items.

During the seeded tests, the equipment detection was as shown in the following table:

Schonstedt	Category I	Category II	Category III	Category IV	Category V
Model GA-52C	56%*-59%**	44% – 49%	34% – 49%	9% – 27%	34% - 53%
Model GA 72Cv	63% – 78%	41% - 51%	41% – 49%	18% – 45%	38% – 44%
Model GA-52Cx	67% – 78%	64% – 74%	39% – 59%	27% – 55%	34% - 63%

^{*} First percentage given is the result for a search radius of 1.6 foot and maximum lane width of five feet.

The detection rate percentages presented in the ODDS varied according to the search radius, which ranged from 1.6 to 3.3 feet and the search lane width which was three to five feet wide. Five-foot wide search lanes were used for the sampling in BLM Area B. Results for the three-foot wide search lanes were not included in the detection percentages presented above because three-foot search lanes were not used during the investigations. A standard search radius for investigation of anomalies was not specified in work plans or reports, therefore, the detection range for the different search radii are presented above.

The seeded test detection rates are considered conservative because one foot was added to the item's depth to accommodate the potential for soil deposition over time. The seeded test items were also buried in both the vertical and horizontal orientations and some items purposely were buried deeper than the equipment was expected to be able to detect. Because the field conditions at the seeded test site and orientation of the subsurface item may not be comparable to BLM Area B conditions, the results should only be used as an indication that the equipment is capable of detecting the same types of items at depths that are the same as used in the seeded tests.

Results of the ODDS FTS were also reviewed for potential use in evaluating instrument performance at the site. Detection rates were calculated for four of the six test sites; the remaining sites did not have enough MEC or MEC-like MD detected to allow calculation of site statistics. The calculated detection rates for the combined sites ranged from 52 to 96 percent for the Schonstedt Model GA 52C, 64 to 98 percent for the Schonstedt Model GA-72Cv, and from 97 to 100 percent for the Schonstedt GA-52Cx, depending on the search radius used for the calculation. As previously discussed, results for the three-foot wide search lanes were not included in the detection percentages presented above because three-foot search lanes were not used during the site investigations in BLM Area B. The lower detection rates were for a 1.6 foot search radius and the higher detection rates were for a 3.3 foot search radius.

^{**} Second percentage given is the result for a search radius of 3.3 feet and lane width of five feet.

Although not directly comparable to BLM Area B, the results of the ODDS indicate that the Schonstedt Models GA-52C, GA-72Cv, and GA-52Cx are capable of detecting ferrous surface and subsurface MEC if present in the surface or shallow subsurface at the site. The results of the ODDS do indicate that the detection rates for the Schonstedt magnetometers drop off between 6 and 12 inches and to zero for some items below 2 feet.

Geonics EM-61 MK2

The Geonics EM61 time domain metal detector was used at BLM Area B to support site assessment technology-aided site walks. The EM61 is capable of detecting both ferrous and non-ferrous metallic objects while being less sensitive to cultural features such as fences, buildings, and power lines. The instruments typically utilize a transceiver coil 1-meter square, but smaller versions are also available. The instrument is easy to use in open areas, but is difficult to use in areas of thick vegetation or steep terrain. The transects performed in the northern portion of BLM Area B were conducted using a single EM61 MK2A unit. Anomalies detected by the EM61 MK2A were flagged and excavated immediately; referred to as real-time EM61.

A geophysical prove-out (GPO) was conducted at the Badger Flats ODDS site in 2006 by Shaw. The results of the GPO were published in a *Geophysical Prove-Out Report, Former Fort Ord, Monterey, California* (GPO Report) (Shaw, 2006b) which discusses all aspects of the GPO and the findings resulting from the GPO.

The GPO work element used numerous ways of processing the data to finalize the most optimal approach. It was decided that an EM61-MK2 threshold value of 14 millivolts (mV) (sum of four channels) would be used for anomaly selection. This threshold focused on the smallest MEC item that would be encountered at MRS-16, which was a 37 mm. This approach should be applicable at other MRS sites within the former Fort Ord facility.

Based on the results of the geophysical prove-out analysis, the instrument configurations, survey techniques and anomaly selection criteria developed by the MRS-16 GPO was subsequently used in geophysical investigations utilizing EM-61 at other MRSs at the former Fort Ord.

3.7.1.3.4 Sampling Review - Quality Assurance/Quality Control

The QA/QC procedures implemented during sampling activities discussed above are described below.

HFA, Inc. Sampling Actions

The HFA QC/Safety Officer conducted sweeps of 10 percent of the project grids. Each magnetometer was field tested each day using a solid steel 81mm projectile buried at four feet bgs as a standard to determine correct operations of each magnetometer.

CMS/USA Environmental Sampling Actions

QA/QC was performed by USA throughout the sampling activities, including daily operational checks and QC inspections, as documented in the final after action reports for sub-areas B-2 (MRS-10B), and B-2A (northeast portion of MRS-10B, MRS-19, and MRS-48) and B-3 (MRS-53BLM). In accordance with the USA work plan (CMS, 1997a), all instruments requiring maintenance and/or calibration were checked prior to the start of each workday, batteries were replaced as needed, and the instruments were checked against a known source. The USA QC specialist was responsible for ensuring that personnel performed operational checks and made appropriate log entries. The QC specialists performed random, unscheduled checks of the various sites to ensure the personnel performed the work as specified in the work plan. The work plan specified that QC consisted of daily and periodic QC audits, as described below.

- Daily QC Audits. According to the work plan, instruments and equipment requiring maintenance and/or calibration were checked prior to the start of each workday. Batteries were replaced as needed, and the instruments were checked against a known source. The QC Specialist was responsible for ensuring that personnel accomplished all operational checks and that the appropriate log entries were made. The QC Specialist performed random, unscheduled checks of the various sites to ensure that personnel followed procedures in the Work Plan and submitted a report of findings to the USA SUXOS.
- Periodic QC Audits. The QC Specialist conducted a quality audit of completed sites within a reasonable time after the completion of the work. These audits were performed by USA's QC Specialist and consisted of a magnetometer inspection (using a Schonstedt Model GA-52Cx magnetometer) of at least 10 percent of each sampling grid. The QC Specialist inspected each operating grid using a zigzag pattern that covered at least 10 percent of the entire grid and submitted a written report of the findings to the Project Manager (PM). The pass/fail criterion for these audits was zero MEC items. If the QC Specialist did not pass the grid, the PM scheduled the area for re-working. In addition to the physical inspection of the site, the QC Specialist conducted an audit of logs to ensure that the proper entries were made. According to QC and QA logs, no MEC items were found during the 10-percent QA/QC. Copies of the QC and QA inspections are provided in the after action reports (USA, 2000a, 2000c, 2001b, 2001d, 2001e).

3.7.1.4 Site Walk Review and Sampling Review - Data Management QA/QC

The requirements of Data Management QA/QC are described in the SOPs provided in the *Final Track 1 OE RI/FS Report* (MACTEC, 2004a). The purpose of the data review was to complete a 100-percent check of all available grid records to identify discrepancies between the reports documenting field activities and the grid records. Discrepancies were then researched and corrections made, if appropriate, before the data were loaded into the project database. The QA review included a comparison of the dataset with the dataset reported in the AAR. The USACE implemented QA review of ten percent of the data reviewed by Parsons.

3.7.2 BLM Area B Sub-Areas B-4, B-5, and B-6

This section presents an evaluation of the removal actions. It includes a summary of the literature review and removal actions for sub-areas where removal actions have been conducted or completed.

3.7.2.1 Literature Review

This section summarizes the literature review completed for each of the removal areas. It includes a summary of the literature review, an evaluation of the subsequent use of each area, and an evaluation of site boundaries.

3.7.2.1.1 Literature Review - Historical Use

Sub-Area B-4 (MRS-10A, northern MRS-10B)

As part of the ASR, an interview was conducted with Mr. Stephani. Mr. Stephani served as a Fort Ord firefighter from 1942 to 1944, at which time he left the Fort Ord fire department and joined the Army. In 1947, Mr. Stephani returned to the Fort Ord fire department, where he worked until he retired, as Fire Chief, in 1978. Mr. Stephani identified the use of shoulder-launched projectiles and rifle grenades in the 1940s and 1950s. A fire department scrap book firebreak map dated 1960 referred to the area of both sites as an "area of unusual hazard and possible live dud area" (USAEDH, 1997a). A 1945 training facilities map identifies these sites as being within Combat Range 2 and within the range fan of the Known Distance Range (Army, 1945). Prior to 1956, the southern portion of MRS-10A and MRS-10B included Bivouac Area A, B, C, D, assigned to the 2nd and 11th Infantry (Army, 1954). A drop zone is in the northwest corner of MRS-10B in a 1956 training map, adjacent to the Vietnam Village identified on a 1972 training map (Army, 1956 and 1972). Two bivouac areas, Training Site 9 (MRS-27I) and Training Site 10 (MRS-27J), were present at these sites through the 1980s (USAEDH, 1997a).

Sub-Area B-5 (MRS-12 and MRS-21)

According to interviews, the hills within MRS-12 (Picnic Canyon) were used as "firing points and target areas for mortars, rifle grenades, and shoulder-launched projectiles in the 1940s and 1950s" (USAEDH, 1997a). The site was also reportedly used as a live-fire reaction course and helicopters were believed to have fired weapons into this canyon (MACTEC/Shaw, 2012). MRS-21 (Mudhen Lake) was identified as a site in the 1993 Archives Search Report. The lake was considered as a possible dump site for munitions (USAEDH, 1993). These sites lie within an area assigned to Division Artillery throughout most of the 1950s (USAEDH, 1997a). Beginning in 1958, the area was assigned to the 41st Signal Battalion (Army, 1958). In 1964, the sites were within Training Area "n," which was assigned to the 1st Brigade (Army, 1964).

Sub-Area B-6 (MRS-14D)

MRS-14D was identified during the ASR. The area is identified as Range P-5 on maps from 1971 through 1987. On a 1991 Army Standard Operating Procedure (SOP), Range P-5 is identified as a 14.5 Artillery and Subcaliber Mortar Range (Army, 1991). The site includes two firing points: MRS-25 and MRS-26 (USAEDH, 1997a). The site is within an area that was assigned to Division Artillery from around 1954 through the late 1950s (USAEDH, 1997a).

3.7.2.1.2 Literature Review - Subsequent Use of the Area

Following the establishment in the 1980s of Training Sites MRS-27I and MRS-27J within the southern portions of MRS-10A and MRS-10B, respectively, the establishment of MRS-27K within a small portion of MRS-12, and the establishment of Range P-5 in MRS-14D in about 1971, no other training was identified within these MRSs. From base closure to the present, sub-areas B-4, B-5, and B-6 have remained undeveloped.

3.7.2.1.3 Literature Review - Establishment of Site Boundaries

The boundaries of MRS-10A, MRS-10B, MRS-12, MRS-21, and MRS-14D were established as part of the archive search process and were based on areas that were identified on training facilities maps or locations where training was reported to have occurred. The evaluation of each of the site boundaries is provided below.

No specific boundaries associated with training at MRS-10A and MRS-10B were identified that would warrant revision of the existing site boundaries.

The boundary of MRS-12 was established based on reports of the hills surrounding the canyon being used as "firing points and target areas for mortars, rifle grenades, and shoulder-launched projectiles" (USAEDH, 1997a). Helicopters were also believed to have fired weapons into the

canyon. No training areas were defined on training facilities maps that would warrant revision of the existing site boundaries.

The boundary of MRS-21 encompasses Mudhen Lake. It was believed there was a possibility that the lake was used to dispose of munitions. No training areas were identified on training maps at this location. Visual surface removals were conducted within MRS-21 because of the Eucalyptus Fire. The results of the visual surface removal did not suggest changes to the site boundaries.

The boundary of MRS-14D was established based on the identification of Range P-5 on training facilities maps. No other training areas or training site boundaries were identified during the literature review that would warrant revision of the existing site boundaries; however, based on the results of the removal action performed at this site, the sub-area B-6 boundary on the eastern and southern sides of MRS-14D is expanded in those areas where MEC (22mm and 14.5mm subcaliber projectiles associated with MRS-14D training) were found in grids located adjacent to and outside the site boundary.

3.7.2.2 MR Removal Action Review

This section presents details regarding the results of the munitions responses at sub-areas B-4, B-5, and B-6. A discussion of sampling equipment, methods, and quality control measures used during sampling and removal efforts is evaluated.

As part of the review of the MMRP database, MEC and MD removed by UXB were assigned location coordinates corresponding to the centers of the grids in which the items were found. Information concerning the depth of MEC and MD were not collected by UXB during sampling and removal actions or by USA Environmental during the removal at MRS-14D. Depth information was collected by USA at MRS-10A, MRS-10B, MRS-12 and MRS-21 during removal actions.

3.7.2.2.1 MR Removal Action Review - Investigation Design

Sub-Area B-4

The investigation of MRS-10A included removal to a depth of 4 feet on unimproved roads and firebreaks performed by UXB, and 1-foot and surface removals performed by USA throughout the sub-area. The investigation of MRS-10B within sub-area B-4 included removal to a depth of 3 feet on unimproved roads leading from MRS-10B to MRS-19 performed by UXB, and SS/GS sampling and a 1-foot removal performed by USA. Vegetation at MRS-10A and MRS-10B consists of CMC and includes areas of oak trees and grasslands. A combination of a controlled burn and mechanical clearing of brush was used to facilitate the MEC surveys, although large

oak trees were not removed. The terrain is mostly gentle slopes with some limited depressions. The cleared areas were divided into 100-foot by 100-foot or 100-foot by 200-foot grids, depending on the type of investigation, and surveyed along a series of adjacent 5-foot-wide search lanes. The UXB investigation used Schonstedt GA-52Cx magnetometers (UXB, 1995d). The USA investigations utilized the Schonstedt GA-52Cx (USA, 2001d, 2001e).

As part of the ODDS, FTS-3 was located in MRS-10A. FTS-3 included four contiguous 100-foot by 100-foot grids in the shape of a square. During the field trial, five MD items were located within FTS-3.

Sub-Area B-5

The investigation of MRS-12 included sampling performed by HFA, random grid sampling to a depth of 4 feet performed by UXB, and a removal action performed by USA to a depth of 1 foot across the entire site. The investigation at MRS-21 involved a removal to 4 feet (deeper if approval was obtained from the USACE) on the western half of the site and random grid sampling to a depth of 4 feet on the eastern portion of the site performed by UXB. USA conducted an investigation on the eastern portion of MRS-21 that included a surface removal on land outside of Mudhen Lake and a removal to a depth of 1 foot on trails (USA, 2000b). Because MRS-12 and MRS-21 lie within habitat areas, only minimal brush cutting was performed. The sites were divided into 100-foot by 100-foot grids and surveyed along a series of adjacent 5-foot-wide search lanes. HFA utilized the Schonstedt GA-52C magnetometer during their investigation of MRS-12. Investigations performed by UXB utilized a combination of the Schonstedt GA-52C, GA-72Cv, and GA-52Cx (UXB, 1995a, 1995b). The investigations conducted by USA utilized the Schonstedt GA-52Cx (USA, 2000c, 2000e).

Sub-Area B-6

The investigation of MRS-14D included random grid sampling performed by UXB and CMS, and a removal to a depth of 4 feet across the entire site (USA, 2001b). MRS-14D consists primarily of rolling hills covered with grasses. Vegetation removal to support the MEC surveys included both manual and mechanical removal of grasses and brush. The site was divided into 100-foot by 100-foot grids and surveyed along a series of adjacent 5-foot-wide search lanes. The investigation performed by UXB used Schonstedt GA-52Cx magnetometers (UXB, 1995c). The investigation conducted by CMS utilized the Schonstedt GA-52Cx (USA, 2001b).

3.7.2.2.2 MR Removal Action Review - Equipment Review

A review of the geophysical instruments used during the removal actions performed within sub-areas B-4, B-5, and B-6 is provided in Section 3.7.1.3.3.

Several different detection instruments were used during the ODDS Field Trials within MRS-10A (Parsons, 2002a), but no removals were conducted in the subject sub-areas after the ODDS.

3.7.2.2.3 MR Removal Action Review - Sampling and Removal Methods

The site boundaries and grids were surveyed and marked to provide control on the areas investigated. Surface removal and subsurface removal actions were performed at the three subareas. Field logs were prepared during sampling and removal actions to note the locations and descriptions of the MD or MEC items found. The depths of items found were recorded for all of sub-area B-6.

Surface removal of MEC was performed by team members walking abreast and online, visually inspecting the ground surface for MEC and MD. When removal teams encountered MEC items, they documented the location and quantity, and provided a description of the items on a grid operation record.

Sample grids for SS/GS sampling were 100 by 200 feet and spaced at least 200 feet apart. SS/GS sampling used a computer program to statistically estimate the ordnance density of a site or grid and can be used to assess whether a site has been characterized adequately. When using SS/GS, the grids are then visually inspected and investigated using a magnetometer and identified anomalies are located, marked, and recorded. If a grid has 20 or fewer anomalies, then all of the anomalies would be investigated. If a grid has more than 20 anomalies, 20 anomalies plus 37 percent of all identified anomalies over 20 were investigated. Generally, 32 to 40 percent of the flagged anomalies were investigated (CMS, 1995). Based on a statistical review of the SS/GS program by EPA in 2000, several concerns were identified regarding the assumptions and design of the SS/GS methodology. Although problems were identified regarding the statistical methodology, the site-specific data collected during investigations within the BLM Area B MRSs is useful in further defining the spatial distribution of MEC and MD.

In 100 percent grid sampling and for removal actions, 100- by 100-foot grids were surveyed and investigated with a magnetometer along maximum 5-foot wide search lanes. Grid searches were accomplished using magnetometers. All subsurface anomalies or metallic surface objects encountered were investigated. Subsurface anomalies were excavated with hand tools. While digging, a magnetometer was used to check and verify the location of the anomaly (CMS, 1995).

3.7.2.2.4 MR Removal Action Review - Quality Assurance/Quality Control

The QA/QC procedures implemented during each of the removals discussed above and during sampling at other BLM Area B sites are described below.

HFA Sampling Actions

QA/QC performed by HFA throughout the field sampling effort is documented in the after action report (HFA, 1994). According to the report, the project was completed without QC discrepancy. It was not possible to perform a check of the reported results and field grid sampling documentation because this information was not available.

Little specific information concerning operational procedures was documented in the HFA report. The following describes field procedures specified in the work plan and the after action report. According to the HFA work plan, equipment was inspected by the SUXOS and QC/SS before it was placed in service (HFA, 1993). Magnetometers were inspected daily on a buried piece of inert ordnance to ensure that the magnetometers were operating within specifications. The test source, a solid steel 81mm mortar (inert ordnance item) was buried at a depth of 4 feet. The magnetometers were tested before sampling operations began in the morning and when operations resumed after lunch (HFA, 1994). Magnetometers that failed inspections and tests were determined to be in need of repair and were to be removed immediately from service. Random checks were to be performed by the QC/SS and/or the SUXOS during daily operations. The QC/SS was to inspect all records bi-weekly to ensure that they were kept and maintained (HFA, 1993).

After surface and subsurface clearance of each site and prior to removal of grid markers, the QC/SS performed the standard minimum 10-percent QC check of each grid (HFA, 1994). If military munitions were discovered during the QC check, the entire grid was to be searched again to ensure that no other anomalies were present. All grids were to be left in place until the USACE OE Safety Specialist completed a 10-percent QA check of the previously checked grids. QC reports that included descriptions and results of the QC checks were to be completed daily.

UXB Removal Actions

The reports that documented UXB's munitions responses indicated that QC checks were performed on each investigated grid (UXB, 1995a, 1995b, 1995c and 1995d). A minimum of 10 percent of each investigated grid was checked to verify that the grid had been surveyed properly. If "any ordnance item, except small arms ammunition," were found during the QC sweep, the grid would need to be resurveyed. The work plan stated that after the QC check, the site would undergo a QA check by the USACE OE Safety Specialist (UXB, 1994).

USA Environmental Sampling and Removal Actions

QA/QC was performed by USA throughout the removal action, including daily operational checks and QC inspections, as documented in the final after action reports for MRS-10A, MRS-

10B, MRS-12, MRS-21, and MRS-14D. In accordance with the USA work plan (CMS, 1997a), all instruments requiring maintenance and/or calibration were checked prior to the start of each workday, batteries were replaced as needed, and the instruments were checked against a known source. The USA QC specialist was responsible for ensuring that personnel performed operational checks and made appropriate log entries. The QC specialists performed random, unscheduled checks of the various sites to ensure the personnel performed the work as specified in the work plan. The work plan specified that QC consisted of daily and periodic QC audits, as described below.

- Daily QC Audits. According to the work plan, instruments and equipment requiring maintenance and/or calibration were checked prior to the start of each workday. Batteries were replaced as needed, and the instruments were checked against a known source. The QC Specialist was responsible for ensuring that personnel accomplished all operational checks and that the appropriate log entries were made. The QC Specialist performed random, unscheduled checks of the various sites to ensure that personnel followed procedures in the Work Plan and submitted a report of findings to the USA SUXOS.
- Periodic QC Audits. The QC Specialist conducted a quality audit of completed sites within a reasonable time after the completion of the work. These audits were performed by USA's QC Specialist and consisted of a magnetometer inspection (using a Schonstedt Model GA-52Cx) of at least 10 percent of each search grid. The QC Specialist inspected each operating grid using a zigzag pattern that covered at least 10 percent of the entire grid and submitted a written report of the findings to the Project Manager (PM). The pass/fail criterion for these audits was zero munitions items. If the QC Specialist did not pass the grid, the PM scheduled the area for re-working. In addition to the physical inspection of the site, the QC Specialist conducted an audit of logs to ensure that the proper entries were made. The PM and SUXOS analyzed all grid QC failures to determine required corrective action. According to QC and QA logs, no munitions items were found during the 10-percent QA/QC. Copies of the QC and QA inspections are provided in the after action reports (USA, 2000a, 2000c, 2001b, 2001d, 2001e).

3.7.2.3 MR Removal Action Review - Data Management QA/QC

The requirements of Data Management QA/QC are described in the SOPs provided in the *Final Track 1 OE RI/FS Report* (MACTEC, 2004a). The purpose of the data review was to complete a 100-percent check of all available grid records to identify discrepancies between the reports documenting field activities and the grid records. Discrepancies were then researched and corrections made, if appropriate, before the data were loaded into the project database. The QA

review included a comparison of the dataset with the dataset reported in the AAR. The USACE implemented QA review of 10 percent of the data reviewed by Parsons.

As part of the review of the MMRP database, MEC and MD removed by UXB were assigned location coordinates corresponding to the centers of the grids in which the items were found. Information concerning the depth of MEC and MD were not collected by UXB during sampling and removal actions or by USA Environmental during the removal at MRS-14D. As a result, the MMRP Database has assigned the depth of zero (on the surface) to these items. Depth information was collected by USA at MRS-10A, MRS-10B, MRS-12 and MRS-21 during removal actions.

3.8 Conclusions and Recommendations

This section presents conclusions and recommendations for BLM Area B sub-areas B-4, B-5, and B-6 based on the review and analysis of the sampling and removal data. This section also provides conclusions and recommendations for BLM Area B sub-areas B-1, B-2, B-2A, B-3, and B-3A, where removal actions were not conducted.

3.8.1 Conclusions

Conclusions regarding the site and the work previously performed are discussed in the context of the following subsections.

3.8.1.1 Site Use and Development

The types of training likely conducted at each MRS where a removal was conducted and within the area where a removal was not conducted is provided below. BLM Area B remains undeveloped and will remain as open space under the jurisdiction of the BLM.

3.8.1.1.1 Sub-Area B-4

Sub-area B-4 likely was used as target areas for a variety of mortars and other projectiles, shoulder-launched projectiles and hand grenades and practice mines.

3.8.1.1.2 Sub-Area B-5

Based on the results of sampling and removal actions and the presence of primarily non-penetrating military munitions, these sites appear to have been used primarily as general training areas using small arms, practice mines, practice rifle grenades, rifle-fired smoke grenades and smoke hand grenades, and pyrotechnic items including signals, flares, and simulators. Little evidence was found to support the use of MRS-12 as an impact area for anything other than shoulder-launched projectiles.

3.8.1.1.3 Sub-Area B-6

Sub-area B-6 was used primarily as a target area for 22mm and 14.5mm practice subcaliber projectiles. Practice 3-inch trench mortars (Stokes) were located on the northwestern border of sub-area B-6. 22mm subcaliber projectiles are training ammunition for 81mm mortars, and 14.5mm subcaliber projectiles are training ammunition for a variety of howitzers (Army, 1994b).

3.8.1.1.4 Sub-Areas B-1, B-2, B-2A, B-3, and B-3A

The non-removal sub-areas appear to have been used for several types of training since 1917. Findings along the boundary of sub-area B-3, within sub-area B-4, the Park Flats MRA, and the Future East Garrison MRA, suggest training with both practice and HE projectiles and rockets before the 1950s. After the 1950s, it appears that the site was used as a general training and maneuver area. MEC and MD removed during site walks and sampling includes 37mm projectiles, 60mm HE and practice mortar projectiles, 2.36-inch rockets, and pyrotechnic and practice munitions. Interviews in the ASR indicated training involving shoulder-launched projectiles and rifle grenades may have been located in sub-areas B-2 and B-3A; however, no evidence of these types of training was found in the sub-areas.

3.8.1.2 Adequacy of Site Investigations – Removal Sites

This section discusses whether previous characterization and removal actions are adequate, survey equipment used was appropriate, and whether the resulting data is usable for conducting an RA and FS.

- Removal actions were performed in sub-areas B-4, B-5, and B-6; all anomalies within the established removal depths were investigated or resolved, and all detected MEC items were removed or destroyed. A portion of MRS-10B in sub-area B-4 did not have a surface or subsurface removal; however, SS/GS sampling was conducted in this area and no MEC or MD items were located. Mudhen Lake was not included in the removal actions in sub-area B-5. Steep slopes in sub-area B-6 were not included in the removal actions. Removal depths varied within and between sites. Based on review of the AARs, anomalies present below the established removal depth were not investigated.
- Evaluation of the previous removal actions validated that the removal actions followed published work plans and SOPs, and all work passed contractor QC and USACE QA.
- Schonstedt Model GA-52C, GA-72Cv, or GA-52Cx magnetometers were used for all removal actions. These magnetometers were evaluated as part of the ODDS and are capable of detecting ferrous military munitions items expected at these sites.

- The Schonstedt magnetometers are less effective for detecting smaller (less than two inches) or more deeply buried (greater than 2 feet) objects.
- Review of the above data has resulted in the determination that the data are usable for conducting a Risk Assessment and Feasibility Study.

3.8.1.3 Adequacy of Investigation – Non-Removal Areas

This section discusses the adequacy of the investigations conducted in the sub-areas of BLM Area B where removal actions were not conducted, and whether the resulting data is usable for conducting an RA and FS. Limitations that should be considered in using the data are also discussed.

- Literature review, site walks, and sampling were performed within BLM Area B subareas B-1, B-2, B-2A, B-3, and B-3A. Site walks and sampling were conducted in limited areas of the site.
- Site walks were generally limited to accessible areas of the site, due to limitations on vegetation removal. Limited vegetation removal was conducted for the site assessment transects conducted in the northern portion of BLM Area B in sub-areas B-1 and B-3.
- Schonstedt Model GA-52C, GA-72Cv, or GA-52Cx magnetometers were used during site walks and sampling investigations. These magnetometers were evaluated as part of the ODDS and are capable of detecting ferrous metallic military munitions items that could be expected at these sites.
- The Schonstedt magnetometers are less effective for detecting smaller (less than 2 pounds) or more deeply buried (greater than 2 feet) objects.
- The Geonics EM61 MK2 was used during the site assessment to perform biased and planned transects in the northern portion of BLM Area B. This instrument was evaluated through a geophysical prove-out and shown to be effective for digital geophysical mapping at Fort Ord.
- Review of the above data has resulted in the determination that the data are usable for conducting a Risk Assessment and Feasibility Study.

3.8.2 Recommendations

The following recommendations are made for removal sites:

• Review of the available literature, removal results, and equipment performance results indicate surface removal is complete for the majority of sub-areas B-4, B-5, and B-6. Subsurface removals were also conducted in portions of these sub-areas, but it is possible

for MEC to be present in the subsurface; therefore, a risk assessment and feasibility study should be performed. The data quality is acceptable for use in the risk assessment and feasibility study.

The following recommendations are made for the sub-areas of BLM Area B where removal actions were not completed (sub-areas B-1, B-2, B-2A, B-3, and B-3A).

- Review of the available literature, site walks, and sampling results indicate that it is possible for MEC, including HE items in some areas (e.g., sub-area B-2A), to be present at the surface or below the ground surface within the vegetated portions of the sub-areas; therefore, a risk assessment and feasibility study should be performed.
- No information was found to indicate that the site boundaries should be revised further.
- The data quality meets the requirements for use in preparation of a risk assessment and feasibility study.

Based on the completion of the Interim Action at MRS-16, remedial alternatives will be evaluated in the feasibility study.

4.0 RISK ASSESSMENT

This section presents the results of the MEC RA that addresses the explosive hazards associated with MEC at BLM Area B at the former Fort Ord. BLM Area B has been grouped into 8 nature and extent sub-areas (B-1, B-2, B-2A, B-3, B-3A, B-4, B-5, and B-6) as shown on Figure 3-5. Risks associated with chemical hazards at these sites were addressed as part of the BRA program (MACTEC/Shaw, 2012), which is a component of the Hazardous and Toxic Waste (HTW) RI/FS program, separate from the MR RI/FS program.

The majority of BLM Area B has been transferred to BLM and is currently open to public access, for recreational uses such as hiking, bicycling, and horseback riding. These uses have been supported safely with past and current measures including munitions responses in known and suspected sites; continued use of roads and trails; providing MEC recognition and safety training to BLM; and implementation of MEC incident reporting system. Roads and trails have been subjected to munitions responses, including surface MEC removal. Subsurface activities have taken place with construction support in some locations. Incident reporting procedure for suspected munitions items have been implemented for over ten years. Based on the current understanding of the site, it is not likely that people traversing on the roads and trails (those that are authorized for public use) would encounter a MEC item. If any MEC (or item that resembles MEC) is discovered in the future, the MEC incident reporting system is in place to address the item. The presence of MEC and associated risks in the vegetated areas is the focus of this RA.

This RA presents a description of the process used for preparing MEC risk assessments, summarizes the data used, describes the receptors evaluated and the inputs used to determine the risk scores, presents the results of the risk assessment, and provides an uncertainty analysis.

4.1 MEC Risk Assessment Process for Fort Ord

A RA is required as part of the RI/FS process. The MEC RA for the former Fort Ord provides an estimate of the risks of a receptor encountering an MEC item. Because the nature of this type of evaluation is largely qualitative, a specific protocol was developed to evaluate current and future MEC risks to humans at Fort Ord. The Fort Ord Ordnance and Explosives Risk Assessment Protocol (Malcolm Pirnie, 2002) was developed through the combined efforts of the Army, the DTSC, and the EPA, and allows for a comparative review of MEC risks at impacted sites.

Unlike typical RAs that evaluate potential exposures to hazardous chemical contaminants in environmental media, the Protocol does not calculate a numerical probability of adverse effects or a hazard index. Rather, it relies on an *a priori* assumption that any encounter with MEC will result in an adverse effect and provides a qualitative description of the risk, based on the

likelihood of encountering an MEC item, combined with the potential of the item to cause a serious injury if detonated. The Protocol is used to develop, and allow for a comparative evaluation of, various remedial alternatives in the FS. The output of the RAs consists of an overall MEC Risk Score for each nature and extent sub-area, designated by the letters "A" through "E," with "A" representing the "lowest risk" and "E" representing the "highest risk." The scores are supported by a brief narrative describing the assumptions used in developing the input factors. A summary of the Protocol and the scoring tables is provided in this RA.

4.2 Data and Data Usability

Data available and used during the preparation of BLM Area B RA are presented in Sections 3.2, 3.3, and 3.4 of the RI. The data quality and usability evaluation of data collected during site walks, sampling, and removal actions is presented in Section 3.7 of the RI. "Usable data" is defined as those data with sufficient quality for use in the decision-making process. All detected MEC were removed in accordance with the approved work plans.

4.3 Description of Proposed Reuse and Potential Receptors

4.3.1 Proposed Reuse

BLM Area B is undeveloped. The current and anticipated future reuse for the property is habitat reserve that will be managed by the BLM as described in the HMP (USACE, 1997). Designated roads and trails are open to the public for recreational activities, including hiking, biking, and horseback riding. Land use is further described in Section 2.1.3.

4.3.2 Potential Receptors

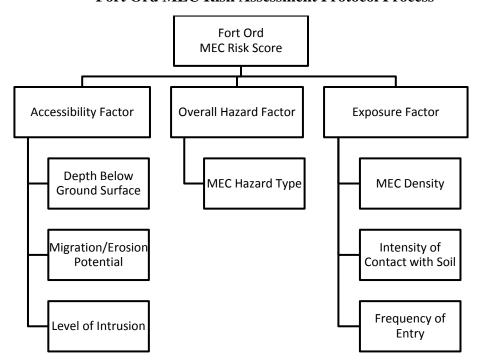

Based on the current and anticipated future reuses described above for BLM Area B, the following receptors were identified for evaluation in the RA:

- Recreational user (hiking, biking, or horseback riding in the area)
- Firefighter (implementing prescribed burns and responding to wildfires)
- Outdoor maintenance worker (habitat restoration, trail maintenance, habitat monitoring and invasive weed control)
- Construction worker (performing earth moving associated with trail or construction)

Each receptor evaluated and a description of the associated activities along with a short narrative describing the level of intrusion, frequency of entry, and intensity of contact with soil is presented in Table 4-1.

4.4 Discussion of MEC Risk Assessment Protocol

As discussed above, the Fort Ord MEC Risk Assessment Protocol is a qualitative RA approach, comprising seven qualitative and quantitative inputs. Two matrices combine six of the inputs (three for each) into risk scores for accessibility and exposure. A third matrix combines the scores for accessibility and exposure factors with the overall hazard factor (based on the MEC hazard type, the seventh input) into a qualitative score for estimating the overall MEC risk. The relationships between the seven inputs and three factors are illustrated below.

Fort Ord MEC Risk Assessment Protocol Process

4.5 Definition of Input Factors and Assumptions

The following paragraphs, based on the *Fort Ord Ordnance and Explosives Risk Assessment Protocol* (Malcolm Pirnie, 2002), discuss each of the inputs and the matrices used to determine an overall MEC risk score.

4.5.1 Accessibility Factor

The accessibility factor reflects how likely it is that any MEC present at an area would be accessible to receptors. Three inputs are considered: (1) the depth of MEC below ground surface (Table 4-2), (2) the level, or depth, of soil intrusion by the receptor (Table 4-4), and (3) migration/erosion potential, which evaluates whether the apparent depth of MEC items will become shallower over time as a consequence of soil erosion (Table 4-5). A score is assigned to

each input using the established criteria, and these inputs are combined to produce an overall score for the accessibility factor using the scoring matrix presented in Table 4-6.

MEC Depth Below Ground Surface

For the Baseline RA, MEC Depth Below Ground Surface scores were developed based on the MEC data from previously conducted munitions responses. Table 4-3 presents the resulting scores for MEC Depth Below Ground Surface for the eight areas. A detailed discussion of the input factors for each sub-area is provided in Section 4.6.

Level of Intrusion

The level of intrusion is dependent on the receptor. Recreational users, firefighters performing prescribed burns, outdoor maintenance workers conducting habitat monitoring or invasive weed control are not expected to intrude below the ground surface, resulting in a score of 1 for level of intrusion. Outdoor maintenance workers conducting habitat restoration and trail maintenance are assumed to intrude up to 3 feet, resulting in an intrusion score of 4 (intrusion greater than 2 feet and less than 4 feet; see Table 4-4). Construction workers are assumed to intrude up to 5 feet, resulting in an intrusion score of 5 (intrusion greater than or equal to 4 feet; see Table 4-4). The input scores for level of intrusion are incorporated into the matrix on Table 4-15. A detailed discussion of the input factors for each sub-area is provided in Section 4.6.

Migration/Erosion Potential

This potential is estimated using the Universal Soil Loss Equation and is assumed to be less than 3/100 inches per year for BLM Area B. This is consistent with the estimates for the Impact Area MRA (MACTEC, 2007) which is located adjacent to BLM Area B. The migration/erosion potential score of 1 (stable) was therefore applied for this factor. This is a reasonable estimate for soil loss for areas of established vegetation; however, higher rates of erosion could be expected in disturbed areas such as roads and excavation areas.

4.5.2 Exposure Factor

The exposure factor (Table 4-12) assesses the likelihood that someone will be exposed to the MEC when in the exposure area. Three inputs are evaluated: (1) MEC density, (2) intensity of contact with soil, and (3) frequency of entry. These three factors are combined in an overall Exposure Factor Scoring Matrix (Table 4-12) to establish an overall score for the exposure factor.

MEC Density

The MEC density score is based on the number of MEC items per acre (Table 4-7), and is assessed to the level of intrusion applicable to the specific receptor. Tables 4-8 and 4-9 present

the MEC densities for each sub-area within BLM Area B. A detailed discussion of the input factors for each sub-area is provided in Section 4.6.

To develop the MEC density score for the nature and extent sub-areas, a statistical program, UXO Estimator, was used to calculate the MEC density in each sub-area. For consistency, a target density of 0.1 items per acre and a target confidence level of 95 percent were used to determine the MEC density in each sub-area. UXO Estimator provides the upper-bound density based on a projected confidence level. It should be noted that scoring of the MEC density factor based on the estimated upper-bound MEC density represents the worst-case scenario. The results of these calculations are provided in Tables 4-8 and 4-9. Basic assumptions and uncertainties related to the use of UXO Estimator are discussed in Section 4.7.2.

Intensity of Contact with Soil

The intensity of contact with soil (Table 4-10) represents an hours-per-day assessment of the receptor's contact with soil. The intensity of contact with soil is receptor dependent and was assumed to be 6 hours per day for the recreational user (a score of 3), and up to 8 hours per day for the firefighter, outdoor maintenance worker, and construction worker (a score of 4).

Frequency of Entry

The frequency of entry (Table 4-11) evaluates the number of entries per year, month, and week based on a person-days-per-year approach. Thus, the frequency of entry is the same if one person visits the site one day each month for a year or if 12 people visit the site for one day during the year. The exposure duration is fixed at one year for all receptors, and the number of exposures during that year is evaluated. Recreation users and maintenance and construction workers are expected to enter the area frequently (a score of 4), while firefighters are expected to enter the area occasionally (a score of 3).

4.5.3 Overall Hazard Factor

The overall hazard factor is an assessment of the inherent hazard of the specific MEC item, and must be determined by UXO-qualified personnel. The overall hazard factor relates to the MEC Hazard Type score that considers the energetic material present in the MEC item and the functioning of the item, and it assumes that all items are fuzed and portable. The scoring is based on both the likelihood that the MEC will cause an injury and the severity of the potential injury. Based on the factors identified above, four scores for the MEC Hazard factor are possible and are presented in Table 4-13. The scores range from 0 to 3, with 0 assigned to inert items and 3 representing the highest hazard. In August 2005, the MEC hazard types were updated (USACE, 2005). The explosive hazard codes are updated periodically (e.g., codes are assigned to new munitions items) and the Fort Ord MMRP database is kept updated to reflect the most

current version. This updated information was used in selecting the hazard factors used in this RA. Scores for each sub-area are based on the MEC items found within the sub-area.

Tables 4-8 and 4-9 show the number of MEC items encountered on the surface and in the subsurface at each sub-area. Descriptions of MEC items encountered in each area are provided in Section 3. Figures 4-1 and 4-2 show the MEC items by hazard type found in BLM Area B North on the surface and in the subsurface, respectively. Figures 4-3 and 4-4 provide the MEC items by hazard type for BLM Area B East.

4.5.4 Overall MEC Risk Score

The overall MEC risk is determined by combining the accessibility, exposure, and overall hazard factors in a matrix (Table 4-14) to yield an overall risk score designated by the letters "A" through "E," where "A" represents the "lowest risk", and "E" represents the "highest risk." In Table 4-16, a narrative accompanying the letter score explains the assumptions used in estimating the risk score for each receptor. It should be noted that the estimated potential risk score is a conservative estimate representing the highest potential risk level for each receptor evaluated. For example, a score of "C" indicates that the risk to that receptor could be as high as "C," or medium.

Overall MEC Risk Score	"A"	"B"	"C"	"D"	"E"
	Lowest	Low	Medium	High	Highest

4.6 MEC Risk Assessment Results

This section describes the results of the risk assessment for each sub-area and each identified receptor. A summary of the input factors and the overall MEC risk score for each receptor is presented in Table 4-15. For each receptor, the risk posed by each MEC Hazard code is scored separately, and the highest of the three scores is used as the overall score for the receptor. The MEC RA assumptions and results for each receptor are summarized in Tables 4-16.1 through 4-16.5. The tables present the results and provide a brief description of the inputs used to generate the resultant score.

4.6.1 Sub-Area B-1

Sub-area B-1 is located within the northwestern portion of BLM Area B, west of the Known Distance Range western boundary. Sub-area B-1 is 110 acres and includes the northern portion of MRS-56 and to the east of MRS-56 (Figure 3-5). Sub-area B-1 has been traversed by visual and technology-aided site walk investigations to be characterized. DGM was conducted along transects during the site assessment and intrusive investigation of anomalies found limited MD

items. To date, only one MEC item was found along the northern boundary of MRS-56 in sub-area B-1. This was a ground illumination signal, MEC hazard code 2, which was found on the surface near the northwestern boundary of MRS-56.

Because only small portions of the sub-area were investigated and only one MEC item has been found, a reliable MEC density estimate cannot be developed. Therefore, overall MEC risk score was not generated for sub-area B-1. While overall MEC risk score was not generated, the assessment indicates that there is a potential that MEC items are present on the surface and receptors could encounter a MEC item within this sub-area.

4.6.2 Sub-Area B-2

Sub-area B-2 is approximately 143 acres in the southern portion of MRS-10B. Training activities in sub-area B-2 included bivouac and maneuver training. Interviews from the ASR indicated that this area may have included firing points for shoulder-launched projectiles and rifle grenades; however, no evidence was found to support such use within sub-area B-2. SS/GS sampling was conducted within sub-area B-2 and one grenade fuze and one pyrotechnic item were found (in the subsurface). While the western portion of B-2 falls within the Known Distance Range, projectile items were not found during the removal action in the immediately adjacent area (within MRS-10A). One incidental item (a practice grenade fuze) was found in 2000 by BLM. In 2011 and 2012, BLM used heavy equipment to restore old Army roads and associated gullies and compacted soil areas within 12 acres of sub-area B-2, with no incidental munitions items reported.

<u>Depth Below Ground Surface</u>: The Depth Below Ground Surface for sub-area B-2 is based on the depth at which MEC items were previously found during sampling activities. MEC hazard type 1 and 2 items (one of each type) were found below the surface and a MEC hazard type 1 item was found on the surface. For surface and subsurface receptors, the Depth Below Ground Surface input factor is a score of 8, or "Any MEC on the surface." This assumption is considered a conservative estimate of the depth for sub-area B-2 because MEC was previously found on the surface and the subsurface. No MEC hazard type 3 items were found during the sampling in sub-area B-2; therefore, no score can be developed for MEC hazard type 3 items.

<u>Level of Intrusion</u>: For surface receptors, the Level of Intrusion input factor is a score of 1, or "Non-Intrusive: Activity on the ground surface, none below the surface." This assumption is considered a reasonable estimate of the Level of Intrusion for surface receptors at sub-area B-2. For subsurface receptors, the Level of Intrusion input factor is a score of 5, or "Highly Intrusive: Ground disturbances greater than four feet bgs." This assumption is considered an overestimate

of the Level of Intrusion for subsurface receptors who are only expected to intrude to a depth of 3 feet or less.

<u>Migration/Erosion Potential</u>: This potential is estimated using the Universal Soil Loss Equation and is assumed to be less than 3/100 inches per year for B-2. The migration/erosion potential score of 1 (stable) was therefore applied for this factor. This is a reasonable estimate for soil loss for areas of established vegetation; however, higher rates of erosion could be expected in disturbed areas such as roads and excavation areas.

MEC Density: As shown on Table 4-8 and 4-9, for both surface and subsurface receptors, the MEC density input factor is a score of 3, or "Medium MEC density (0.1 to 1 item per acre)," for MEC hazard type 1. For subsurface receptors, the MEC density input factor is a score of 3 for MEC hazard type 2, or "Medium MEC density (0.1 to 1 item per acre)." Of the 143 acres in subarea B-2, 37 acres have been investigated or restored. Using UXO Estimator, the calculated density for MEC hazard code 1 on the surface, based on the 95% confidence level, is 0.11 items per acre. Using UXO Estimator, the calculated densities for MEC hazard codes 1 and 2 in the subsurface, based on the 95% confidence level, are 0.15 and 0.11 items per acre, respectively. No MEC hazard code 3 items have been located and no MEC hazard code 2 items have been found on the surface in sub-area B-2; therefore, a MEC density for MEC hazard code 3 items and MEC hazard code 2 items on the surface was not calculated. The MEC density scores are considered an over-estimate of the MEC density for surface and subsurface receptors at sub-area B-2 because: (1) vegetation clearance was achieved by prescribed burning, which cleared a larger footprint than the sampling grids; (2) no surface MEC item was recovered from the sampling investigation; (3) no munitions item was identified during BLM's habitat restoration and trail maintenance activities in 2011 and 2012; and (4) the MEC density calculations are based on small numbers of items (total three MEC items) providing an upper-bound density for the site.

Intensity of Contact with Soil: For surface receptors, the Intensity of Contact with Soil input factor is a score of 3, or "Moderate: ≤6 hours/day." This assumption may overestimate or underestimate the contact with soil for recreational users at sub-area B-2 depending on the type of activities conducted. As an example, a hiker may have more contact with soil than a mountain biker. Recreational receptors are also expected to stay on the established roads and trails, which are safe for the intended uses. For subsurface receptors the Intensity of Contact with Soil input factor is a score of 4, or "High: ≤9 hours/day." This assumption is considered an overestimate of the contact with soil for an outdoor maintenance worker or a construction worker who would typically work between 6 and 8 hours in contact with the soil.

<u>Frequency of Entry:</u> For surface receptors, the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption may overestimate or underestimate the frequency for recreational users at sub-area B-2 depending on the type of activities conducted. As an example, some users may use the area every day and some users may only use the area once a month or less. For subsurface receptors the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption is considered reasonable estimate of the frequency for an outdoor maintenance worker or a construction worker and an overestimate for a firefighter who would only enter the area for an emergency.

Overall Hazard Factor: The types of MEC discovered in sub-area B-2 are MEC hazard types 1 and 2.

Overall MEC Risk Score: For surface receptors, the Overall MEC Risk Score is a score of "D," or "High Risk." This score is a conservative estimate of the risk for surface receptors because: (1) only one MEC item (a grenade fuze) was located on the surface during the history of munitions investigations and land use; (2) the MEC density score is based on the one MEC item and calculated upper-bound density for the site; and (3) based on historical training, the types of munitions that would potentially be present are practice and pyrotechnic items. For subsurface receptors the Overall MEC Risk Score is "E," or "Highest Risk." This score is conservative considering that: (1) only two MEC items were found in the subsurface during 1997 sampling (one grenade fuze and one pyrotechnic item); (2) no munitions item was identified during BLM's habitat restoration and trail maintenance activities in 2011 and 2012; (3) the MEC density score is based on the two MEC items and calculated upper-bound for the site; and (4) based on historical training, the types of munitions that would potentially be present are practice and pyrotechnic items.

4.6.3 Sub-Area B-2A

Sub-area B-2A is 74 acres and includes MRS-19, MRS-48, and the northernmost portion of MRS-10B. Hand grenade training was reported to have taken place in MRS-19 and, hand grenade and rifle grenade training in MRS-48. Grid sampling and SS/GS sampling was conducted in MRSs 19 and 48 and the northern portion of MRS-10B.

<u>Depth Below Ground Surface</u>: MEC hazard type 1 items were found on the surface and to a depth of five inches in sub-area B-2A. MEC hazard types 2 and 3 were found on the surface in sub-area B-2A. For surface and subsurface receptors, the Depth Below Ground Surface input factor is a score of 8, or "Any MEC on the surface." This assumption is considered a reasonable

estimate of in sub-area B-2A because MEC items were found on the surface and potentially could be found in the subsurface.

<u>Level of Intrusion</u>: For surface receptors, the Level of Intrusion input factor is a score of 1, or "Non-Intrusive: Activity on the ground surface, none below the surface." This assumption is considered a reasonable estimate of the Level of Intrusion for surface receptors at sub-area B-2A. For subsurface receptors, the Level of Intrusion input factor is a score of 5, or "Highly Intrusive: Ground disturbances greater than four feet bgs." This assumption is considered an overestimate of the Level of Intrusion for subsurface receptors who are only expected to intrude to a depth of 3 feet or less.

<u>Migration/Erosion Potential</u>: This potential is estimated using the Universal Soil Loss Equation and is assumed to be less than 3/100 inches per year for B-2A. The migration/erosion potential score of 1 (stable) was therefore applied for this factor. This is a reasonable estimate for soil loss for areas of established vegetation; however, higher rates of erosion could be expected in disturbed areas such as roads and excavation areas.

MEC Density: As shown on Table 4-8 and 4-9, for both surface and subsurface receptors, the MEC density input factor is a score of 3 for all three MEC hazard types, or "Medium MEC density (0.1 to 1 item per acre)." Of the 74 acres in sub-area B-2A, 12.4 acres have been surveyed. Using UXO Estimator the calculated upper-bound densities with 95% confidence level for MEC hazard codes 1, 2, and 3 on the surface are 0.35, 0.46, and 0.80 items per acre, respectively. Using UXO Estimator, the calculated upper-bound densities, with 95% confidence level for MEC hazard codes 1, 2, and 3 in the subsurface, are 0.80, 0.48, and 0.80 items per acre, respectively. The MEC density scores are considered a reasonable estimate of the MEC density for surface and subsurface receptors at sub-area B-2A because removals have not been completed to date.

Intensity of Contact with Soil: For surface receptors, the Intensity of Contact with Soil input factor is a score of 3, or "Moderate: ≤6 hours/day." This assumption may overestimate or underestimate the contact with soil for recreational users at sub-area B-2A depending on the type of activities conducted. As an example, a hiker may have more contact with soil than a mountain biker. Recreational receptors are also expected to stay on the established roads and trails, which are safe for the intended uses. For subsurface receptors the Intensity of Contact with Soil input factor is a score of 4, or "High: ≤9 hours/day." This assumption is considered an overestimate of the contact with soil for an outdoor maintenance worker or a construction worker who would typically work between 6 and 8 hours in contact with the soil.

<u>Frequency of Entry:</u> For surface receptors, the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption may overestimate or underestimate the frequency for recreational users at sub-area B-2A depending on the type of activities conducted. As an example, some users may use the area every day and some users may only use the area once a month or less. For subsurface receptors the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption is considered reasonable estimate of the frequency for an outdoor maintenance worker or a construction worker and an overestimate for a firefighter who would only enter the area for an emergency.

Overall Hazard Factor: The types of MEC discovered in B-2A are MEC hazard types 1, 2, and 3.

Overall MEC Risk Score: The Overall MEC Risk Score is a score of "E," or "Highest Risk." This score is a reasonable estimate of the risk for surface and subsurface receptors because potential MEC remains on the surface and in the subsurface of the vegetated areas.

4.6.4 Sub-Area B-3

Sub-area B-3 is 718 acres and includes MRS-09, MRSs-27G and 27H, MRS-53BLM, MRS-41, MRS-54, the southern portion of MRS-56, the northern portion of MRS-58, and the remaining areas within BLM Area B. With the exception of MRS-09 and MRS-53BLM, sub-area B-3 has limited MR data. Bivouac areas are shown on historical training maps for MRS-58 and the MRS-41 area was identified as "Powder Magazine" within Combat Range 3. Investigation activities conducted in sub-area B-3 were limited because of lack of historical evidence of training activities in the sub-area and those conducted were limited to site walks (visual and instrument- aided) along trails, existing roads and paths due to dense vegetation. Limited information is available regarding potential presence of MEC in the southwestern non-MRS area and MRS-54. While more data are available for MRS-56, MRS-58, and the northeastern non-MRS area, site walks and instrument-aided site walk investigations at these sites were also limited to existing trails, and no sampling was conducted.

With only limited numbers of MEC items found and approximately 3 percent of the acreage investigated, a reliable MEC density estimate cannot be developed, and overall MEC risk score was not generated for sub-area B-3. While overall MEC risk score was not generated, the assessment indicates that there is a potential that MEC items are present on the surface and receptors could encounter a MEC item within sub-area B-3.

4.6.5 Sub-Area B-3A

Sub-area B-3A is 63 acres and consists of the southern portion of MRS-58. Interviews conducted during the ASR indicated that MRS-58 may have been used as a target area for

shoulder-launched projectiles and rifle grenades, but no items of that type were found. This sub-area has been traversed by visual and instrument-aided site walk investigations and no MEC or MD items were found within B-3A. Without MEC items found to determine input factors, the Fort Ord MEC Risk Protocol cannot be adequately applied to B-3A. In general, no MEC or MD would indicate that a risk is not present in sub-area B-3A. However, to be conservative, sub-area B-3A is retained for evaluation in the Feasibility Study in Section 5.

4.6.6 Sub-Area B-4

Sub-area B-4 is 345 acres and consists of MRS-10A and the northern portion of MRS-10B. A 1945 training map identifies MRS-10A to be within "Combat Range 2." The majority of sub-area B-4 is within the Known Distance Range that is depicted as having an "advancement line" that was associated with the firing of mortars along with the advancement of troops (USA, 2001e). Surface removal was conducted in the southern portion of MRS-10A. Subsurface removal to one foot was conducted in the northern portions of MRS-10A and 10B, and in the southeastern portion of MRS-10A (Figure 3-3). A portion of MRS-10B included in sub-area B-4 (approximately 6 percent of the total acreage) did not have surface or subsurface removal. This portion had SS/GS sampling and no MD or MEC was found.

<u>Depth Below Ground Surface:</u> MEC items in sub-area B-4 were removed from the surface and to a depth of one-foot in the majority of the sub-area with items found on the surface and to a depth of 30 inches bgs. However, some of the sub-area did not have removal actions performed. For surface and subsurface receptors, the Depth Below Ground Surface input factor is a score of 8, or "Any MEC on the surface." Because a portion of the site only had SS/GS sampling, this assumption is considered a reasonable estimate of the depth of items at sub-area B-4.

<u>Level of Intrusion</u>: For surface receptors, the Level of Intrusion input factor is a score of 1, or "Non-Intrusive: Activity on the ground surface, none below the surface." This assumption is considered a reasonable estimate of the Level of Intrusion for surface receptors at sub-area B-4. For subsurface receptors, the Level of Intrusion input factor is a score of 5, or "Highly Intrusive: Ground disturbances greater than four feet bgs." This assumption is considered an overestimate of the Level of Intrusion for subsurface receptors who are only expected to intrude to a depth of 3 feet or less.

<u>Migration/Erosion Potential</u>: This potential is estimated using the Universal Soil Loss Equation and is assumed to be less than 3/100 inches per year for B-4. The migration/erosion potential score of 1 (stable) was therefore applied for this factor. This is a reasonable estimate for soil loss for areas of established vegetation; however, higher rates of erosion could be expected in disturbed areas such as roads and excavation areas.

MEC Density: As shown on Table 4-8, for surface receptors, the MEC density input factor is a score of 3, or "Low MEC density (< 0.1 item per acre)" for MEC hazard type 1 and a score of 2, or "Medium MEC density (0.1 to 1 item per acre)," for MEC hazard types 2 and 3. As shown on Table 4-9, for subsurface receptors, the MEC density input factor is a score of 3 for all three MEC hazard types 2 and 3, or "Medium MEC density (0.1 to 1 item per acre)." Of the 345 acres in sub-area B-4, 325.8 acres had a surface removal and a portion of the sub-area had a subsurface removal to one foot. Using UXO Estimator, the calculated densities for MEC hazard codes 1, 2, and 3 on the surface, based on the 95% confidence level, are 0.18, 0.06, and 0.08 items per acre, respectively. Using UXO Estimator, the calculated densities for MEC hazard codes 1, 2, and 3 in the subsurface, based on the 95% confidence level, are 0.89, 0.17, and 0.33 items per acre, respectively. In general, MEC density scores are considered an underestimate of the MEC density for subsurface receptors at sub-area B-4 because surface removal and removal to one-foot was conducted in portions of sub-area B-4; however, anomalies below one foot were not intrusively investigated. For surface receptors, the MEC density is considered overestimate because UXO Estimator assumes the removed items are still present.

Intensity of Contact with Soil: For surface receptors, the Intensity of Contact with Soil input factor is a score of 3, or "Moderate: ≤6 hours/day." This assumption may overestimate or underestimate the contact with soil for recreational users at sub-area B-4 depending on the type of activities conducted. As an example, a hiker may have more contact with soil than a mountain biker. Recreational receptors are also expected to stay on the established roads and trails, which are safe for the intended uses. For subsurface receptors the Intensity of Contact with Soil input factor is a score of 4, or "High: ≤9 hours/day." This assumption is considered an overestimate of the contact with soil for an outdoor maintenance worker or a construction worker who would typically work between 6 and 8 hours in contact with the soil.

<u>Frequency of Entry:</u> For surface receptors, the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption may overestimate or underestimate the frequency for recreational users at sub-area B-4 depending on the type of activities conducted. As an example, some users may use the area every day and some users may only use the area once a month or less. For subsurface receptors the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption is considered reasonable estimate of the frequency for an outdoor maintenance worker or a construction worker and an overestimate for a firefighter who would only enter the area for an emergency.

Overall Hazard Factor: The types of MEC discovered in B-4 were hazard types 1, 2, and 3.

Overall MEC Risk Score: For surface receptors, the Overall MEC Risk Score is a score of "E," or "Highest Risk." This score is an overestimate of the risk for surface receptors because a surface MEC removal, and in some areas a one-foot subsurface MEC removal, was performed in sub-area B-4. For subsurface receptors, the Overall MEC Risk Score is "E," or "Highest Risk." This score is reasonable considering potential MEC remaining below one foot and subsurface receptors intruding below one foot.

4.6.7 Sub-Area B-5

Sub-area B-5 is 43 acres and consists of MRS-12 and MRS-21. Surface removal was conducted and subsurface removal to a depth of one-foot was conducted in MRS-12. Subsurface removal to a depth of four feet was conducted over the western portion of MRS-21. In the eastern portion of MRS-21, visual surface removal was conducted outside of Mudhen Lake when the lake was at its lowest level and removal to one-foot along trails was conducted.

Depth Below Ground Surface: MEC hazard type 1 items were found on the surface and to a depth of 18 inches in sub-area B-5. MEC hazard types 2 and 3 were found on the surface and to a depth of six inches in sub-area B-5. For surface receptors, the Depth Below Ground Surface input factor is a score of 7, or "No MEC on the surface and MEC below surface." Because a surface removal was conducted throughout B-5, this assumption is considered an overestimate of the potential for MEC outside of Mudhen Lake. This assumption is considered a reasonable estimate for potential MEC within Mudhen Lake because items would likely be covered by sediment from lake. For subsurface receptors, the Depth Below Ground Surface input factor is a score of 7, or "No MEC on the surface and MEC below surface." This assumption is considered an overestimate of the depth for the portions of B-5 where one-foot and 4-foot removals were conducted. Visual surface removal was conducted at the edge of Mudhen Lake; however, the potential for MEC items in Mudhen Lake is uncertain. This assumption is considered a reasonable estimate for potential MEC within Mudhen Lake.

<u>Level of Intrusion</u>: For surface receptors, the Level of Intrusion input factor is a score of 1, or "Non-Intrusive: Activity on the ground surface, none below the surface." This assumption is considered a reasonable estimate of the Level of Intrusion for surface receptors at sub-area B-5. For subsurface receptors, the Level of Intrusion input factor is a score of 5, or "Highly Intrusive: Ground disturbances greater than four feet bgs." This assumption is considered an overestimate of the Level of Intrusion for subsurface receptors who are only expected to intrude to a depth of 3 feet or less.

<u>Migration/Erosion Potential</u>: This potential is estimated using the Universal Soil Loss Equation and is assumed to be less than 3/100 inches per year for B-5. The migration/erosion potential

score of 1 (stable) was therefore applied for this factor. This is a reasonable estimate for soil loss for areas of established vegetation; however, higher rates of erosion could be expected in disturbed areas such as roads and excavation areas.

MEC Density: As shown on Table 4-8, for surface receptors, the MEC density input factor is a score of 3, or "Low MEC density (< 0.1 item per acre)," for MEC hazard types 1 and 2. MEC density input factor is a score of 2, or "Medium MEC density (0.1 to 1 item per acre)," for MEC hazard type 3. This is considered an overestimate of the MEC density for surface receptors in sub-area B-5 because surface removal was conducted in all of sub-area B-5 except within Mudhen Lake. As shown on Table 4-9, for subsurface receptors, the MEC density input factor is a score of 4 for MEC hazard type 1 ("High MEC density [>1 item per acre]"); a score of 3 for MEC hazard type 2 ("Medium MEC density [0.1 to 1 item per acre]"); and a score of 2 for MEC hazard type 3 ("Low MEC density [<0.1 items per acre]). Of the 43 acres in sub-area B-5, 40.2 acres had a surface removal; a portion of that area had a subsurface removal to one foot, and a smaller portion to four feet. Using UXO Estimator, the calculated densities for MEC hazard codes 1, 2, and 3 on the surface, based on the 95% confidence level, are 0.63, 0.14, and 0.05 items per acre, respectively. Using UXO Estimator, the calculated densities for MEC hazard codes 1, 2, and 3 in the subsurface, based on the 95% confidence level, are 2.15, 0.19, and 0.07 items per acre, respectively. In general, MEC density scores are considered an overestimate of the MEC density for subsurface receptors at sub-area B-5 because removals to one-foot and fourfeet were conducted in portions of sub-area B-5 and UXO Estimator assumes the removed items are still present. The assumptions used to calculate the MEC density would include the potential for MEC to be present in Mudhen Lake.

Intensity of Contact with Soil: For surface receptors, the Intensity of Contact with Soil input factor is a score of 3, or "Moderate: ≤6 hours/day." This assumption may overestimate or underestimate the contact with soil for recreational users at sub-area B-5 depending on the type of activities conducted. As an example, a hiker may have more contact with soil than a mountain biker. Recreational receptors are also expected to stay on the established roads and trails, which are safe for the intended uses. For subsurface receptors the Intensity of Contact with Soil input factor is a score of 4, or "High: ≤9 hours/day." This assumption is considered an overestimate of the contact with soil for an outdoor maintenance worker or a construction worker who would typically work between 6 and 8 hours in contact with the soil.

<u>Frequency of Entry:</u> For surface receptors, the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption may overestimate or underestimate the frequency for recreational users at sub-area B-5 depending on the type of activities conducted. As an example, some users may use the area every week and some users

may only use the area once a month or less. For subsurface receptors the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption is a reasonable estimate of the frequency for an outdoor maintenance worker or a construction worker and an overestimate for a firefighter who would only enter the area for an emergency.

Overall Hazard Factor: The types of MEC discovered in B-5 were hazard types 1, 2, and 3.

Overall MEC Risk Score: For surface receptors, the Overall MEC Risk Score is a score of "D," or "High Risk." This score is an overestimate of the risk for surface receptors because a surface MEC removal throughout B-5 and a one-foot and a four-foot subsurface MEC removal were conducted in portions of B-5, except within Mudhen Lake. For subsurface receptors the Overall MEC Risk Score is "E," or "Highest Risk." This score is a reasonable estimate for a one-foot removal and subsurface receptors intruding below one foot. The score is an overestimate of the risk in the area where a four-foot removal was performed.

4.6.8 Sub-Area B-6

Sub-area B-6 is 100 acres and consists of MRS-14D and portions of MRS-14B and MRS-14E. Sub-area B-6 was Range P-5 and was used for 14.5mm and 22mm subcaliber training. Munitions responses at MRS-14D consisted of surface and subsurface removal action to a depth of four feet. Removal action included expansion grids into MRSs-14B and 14E. Some grids included in sub-area B-6 were not investigated because steep slopes and difficult terrain.

<u>Depth Below Ground Surface:</u> MEC items in sub-area B-6 were removed from the surface and to a depth of four-feet; however, the depth below ground surface was not required to be documented during the removal. For surface and subsurface receptors, the Depth Below Ground Surface input factor is a score of 1, or "100% of detected MEC was removed considering the data quality for the site." Because a surface removal and removal to four-foot bgs was conducted in a majority of sub-area B-6, this assumption is considered a reasonable estimate of the depth of items at sub-area B-6. The portions of sub-area B-6 that were not accessible may have a higher Depth Below Ground Surface.

<u>Level of Intrusion</u>: For surface receptors, the Level of Intrusion input factor is a score of 1, or "Non-Intrusive: Activity on the ground surface, none below the surface." This assumption is considered a reasonable estimate of the Level of Intrusion for surface receptors at sub-area B-6. For subsurface receptors, the Level of Intrusion input factor is a score of 5, or "Highly Intrusive: Ground disturbances greater than four feet bgs." This assumption is considered an overestimate of the Level of Intrusion for subsurface receptors who are only expected to intrude to a depth of 3 feet or less.

Migration/Erosion Potential: This potential is estimated using the Universal Soil Loss Equation and is assumed to be less than 3/100 inches per year for B-6. The migration/erosion potential score of 1 (stable) was therefore applied for this factor. This is a reasonable estimate for soil loss for areas of established vegetation; however, higher rates of erosion could be expected in disturbed areas such as roads and excavation areas.

MEC Density: As shown on Tables 4-8, the MEC density input factor for surface and subsurface receptors is a score of 4, or "High MEC density (>1 item per acre)," for MEC hazard type 1. The MEC density input factor is a score of 2, or "Low MEC density (<0.01 items per acre)," for MEC hazard types 2 and 3. Because MEC recovery depths were not recorded, the MMRP database has assigned the depth of zero to the MEC items recovered during the removal action in MRS-14D. For the MEC density analysis they are considered surface items, however, they were actually recovered from varying depths from the surface to 4 feet bgs. Of the 100 acres in sub-area B-6, 89 acres had a surface and subsurface removal. Using UXO Estimator, the calculated densities for MEC hazard codes 1, 2, and 3 on the surface, based on the 95% confidence level, are 496.7, 0.10, and 0.06 items per acre, respectively. The MEC density scores are considered an overestimate of the MEC density for sub-area B-6 because all MEC items are assumed to be on the surface, but they were found at varying depths. In addition, the MEC density is considered overestimate because UXO Estimator assumes the removed items are still present, and many of the MEC items could have been expended, or MD, because the contractor was not required to determine whether items were HE or expended.

Intensity of Contact with Soil: For surface receptors, the Intensity of Contact with Soil input factor is a score of 3, or "Moderate: ≤6 hours/day." This assumption may overestimate or underestimate the contact with soil for recreational users at sub-area B-6 depending on the type of activities conducted. As an example, a hiker may have more contact with soil than a mountain biker. Recreational receptors are also expected to stay on the established roads and trails, which are safe for the intended uses. For subsurface receptors the Intensity of Contact with Soil input factor is a score of 4, or "High: ≤9 hours/day." This assumption is considered an overestimate of the contact with soil for an outdoor maintenance worker or a construction worker who would typically work between 6 and 8 hours in contact with the soil.

<u>Frequency of Entry:</u> For surface receptors, the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This assumption may overestimate or underestimate the frequency for recreational users at sub-area B-6 depending on the type of activities conducted. As an example, some users may use the area every week and some users may only use the area once a month or less. For subsurface receptors the Frequency of Entry input factor is a score of 4, or "Frequent: Will occur frequently (once a week or more)." This

assumption is considered reasonable estimate of the frequency for an outdoor maintenance worker or a construction worker and an overestimate for a firefighter who would only enter the area for an emergency.

Overall Hazard Factor: The types of MEC discovered in sub-area B-6 include hazard types 1, 2, and 3.

Overall MEC Risk Score: For surface and subsurface receptors, the Overall MEC Risk Score is a score of "E," or "Highest Risk." This score is an overestimate of the risk for a surface receptor because a surface MEC removal was conducted over the majority of sub-area B-6. This score is an overestimate of the risk for subsurface users because a four-foot subsurface MEC removal was conducted over the majority of sub-area B-6.

4.6.9 Summary of Results

Table 4-15 provides the input factors, overall accessibility and exposure factors, and the overall risk for each receptor type. The following summary provides the risk scores by receptor and by sub-area:

Sub-Area	Surface Receptor	Subsurface Receptor
Sub-area B-1	NS	NS
Sub-area B-2	"D"	"E"
Sub-area B-2A	"E"	"E"
Sub-area B-3	NS	NS
Sub-area B-3A	NS	NS
Sub-area B-4	"E"	"E"
Sub-area B-5	"D"	"E"
Sub-area B-6	"E"	"E"

 $\overline{NS} = \text{not scored}$

4.7 Uncertainty

This section addresses the uncertainties in the RA related to data used in the RA, input scores, and assumptions about the uses of the land by future receptors.

4.7.1 Data

The data used in performance of the RA went through a thorough QC/QA process, as outlined in Section 3.6 of the RI, and the related munitions responses met the objectives outlined in the work plans. The objectives of the work plans had been met, detected MEC had been removed, and the data were considered usable for performing the RA. Uncertainties in the representativeness of the existing data remain because the investigation coverage is not 100 percent in all of the areas

evaluated; however, collecting additional data is not expected to fully address the uncertainty unless nearly all of BLM Area B is investigated.

4.7.2 Input Scores

The following paragraphs address uncertainties related to each of the input scores.

MEC Depth Below Ground Surface

Scores for Depth Below Ground Surface used in performing the RA were selected based on field depth measurements of MEC items found and on data quality that meets the project data quality objectives, as specified in the Protocol. The scores are described in Table 4-2. Table 4-3 lists the MEC depth scoring inputs used for the different sub-areas and MEC hazard types. Data quality is defined by detection and removal procedures having met the data quality criteria for the sub-areas based on clearly identified investigation objectives. The investigation and removal actions met the investigation objectives. However, not all of the sub-areas had subsurface investigations performed. For subsurface investigations and removal actions, the detection efficiencies of the geophysical instruments used are not 100 percent; meeting the investigation objectives does not eliminate the possibility that MEC still could be present below the surface, particularly below the depth of sensitivity of the instruments used for MEC detection. For sub-area B-6, depths were not required to be collected for the removal action and; therefore, the actual depths of items found are not known.

Migration/Erosion Potential

The same Erosion Potential Score was used for this RA as was used in the Track 3 Impact Area MRA RI/FS (MACTEC, 2007) based on similar soil, vegetation cover, and topographic conditions. Scores are defined in Table 4-5. Erosion is expected to be low in well-vegetated areas and areas that are paved, but could be higher in areas where soil is disturbed, such as in excavation areas and along unpaved roads and trails. Use of the lowest input factor could result in an underestimation of the overall risk; however, based on a review of topographical data and because the majority of the site is, and will be, vegetated, the score of "1" for erosion potential best represents the current and anticipated future site conditions. Some portions of the site will have higher erosion potential.

Level of Intrusion

The level of intrusion score is based on an assumed depth of soil intrusion by each receptor, based on expected behavior, as defined in Table 4-4. If receptors intrude to depths less than the assumed depths, the risk would be overestimated, and if receptors intrude to depths greater than

the assumed depths, the risk would be underestimated. Expected intrusion depths used in the BLM Area B RA are reasonable and realistic for each receptor, minimizing the uncertainty.

MEC Density

The MEC density factor is presented in Table 4-7. The MEC Density scores are based on the MEC items that have been removed in previous munitions responses. These items are no longer present at the site.

Upper-bound MEC densities were calculated using UXO Estimator assuming a target confidence level of 95 percent. UXO Estimator was chosen to determine an upper-bound density within each sub-area while recognizing that the level of investigation or removal was not consistent in each sub-area. It is recognized that the use of UXO Estimator adds uncertainty to the development of the MEC density scores. The UXO Estimator assumptions that could add uncertainty to the risk scores include:

- UXO Estimator assumes that the items found were not removed from the project site. This assumption will necessarily overestimate the density for the sub-areas.
- If UXO Estimator is applied throughout a project site, the ordnance detection system employed should remain consistent. Different detection systems were used during different investigations in some of the sub-areas in BLM Area B. The EM-61 transects in the site assessment and the ODDS Field Trials grids in 10A used digital equipment. All of the other investigations in BLM Area B used analog equipment or were visual.
- UXO Estimator assumes items are randomly distributed throughout the project site. This assumption can be problematic where only one location is used for multiple items found throughout a grid. For example, UXB grid sheets show locations of recovered items within the grids; however, for the purpose of the MMRP database and GIS, items were attributed to the grid and given the location of the centroid of the grid.
- UXO Estimator only assumes that MEC will be located, not the specific type of MEC.
 Because the Protocol scoring is based on MEC hazard types, UXO Estimator was used to
 calculate a density for each hazard type. However, the upper-bound density for all of the
 hazard types combined may not equal the sum of the upper-bound densities for each of
 the hazard types.

Because some sub-areas have had less investigation than others, the calculated density may either overestimate or underestimate actual MEC densities. The density estimates obtained from the UXO Estimator are considered upper-bound densities, meaning, a program user can be 95% confident that the actual densities are between zero and the calculated upper-bound density.

MEC removal actions were conducted in sub-areas B-4, B-5 and B-6. Detection and removal procedures met the data quality criteria for investigated sites based on clearly identified investigation objectives, the planned reuse for the sites, and detection of the types of MEC expected. The removal actions met the investigation objectives; however, meeting the investigation objectives does not eliminate the possibility that MEC still could be present below the surface, because the detection efficiencies are not 100 percent.

Significant uncertainty exists in some sub-areas where little MEC detection has been performed, such as in sub-area B-3. The density of MEC found in the Parker Flats MRA to the west, in sub-area B-4, and in the Future East Garrison MRA to the east, indicates that the MEC density in sub-area B-3 may be similar; however, such estimates may overestimate the actual densities for sub-area B-3.

Frequency of Entry and Contact with Soil

The frequency of entry input from Table 4-10 depends on assumptions about the behavior of receptors that access the sub-area. The Frequency of Entry input is a measure of the number of times per year that a receptor (one or more persons) will be in the sub-area. If people were to visit the site more times per year than is assumed in the risk assessment, then the overall risk estimated for that receptor would underestimate the actual risk. The opposite is also true: if people were to visit the site fewer times than is assumed in the risk assessment, then the overall risk would be overestimated. Since three of the four sub-area B receptor types are expected to have a high frequency of visits and one receptor is expected to have an occasional frequency of visits, the overall risk is not likely to be underestimated.

Intensity of Contact with Soil

The intensity of contact with soil input is a measure of the length of time the receptor will have contact with the exposure medium (in this case, soil). As with the Frequency of Entry uncertainties, if the receptor spends more time in contact with the soil than assumed, the overall risk for the receptor would be underestimated, and if the receptor were to spend less time in contact with the soil, the overall risk score could be overestimated. Recreational receptors are also expected to stay on the established roads and trails, which are safe for the intended uses. The assumptions used, including 6 hours per day for recreational users (moderate intensity of contact) and 8 hours per day for all other receptor types (high intensity of contact), should avoid underestimation and provide minimal uncertainty for this input.

4.8 Conclusions

The following conclusions can be made based on the results of the BLM Area B RA.

- Based on the current conditions the overall MEC risk score is "D" ("high risk") for surface receptors in sub-areas B-2 and B-5.
- Based on the current conditions the overall MEC risk score is "E" ("highest risk") for all receptors for sub-areas B-2A, B-4, and B-6 and for subsurface receptors for sub-areas B-2 and B-5.
- Because of the limited data available to apply the Fort Ord MEC Risk Protocol, overall risk scores were not developed for sub-areas B-1, B-3, and B-3A.

The Fort Ord MEC Risk Assessment Protocol is a qualitative assessment based on conservative assumptions. It should be noted that the estimated potential risk score is a conservative estimate representing the highest potential risk level for each receptor evaluated. For example, a score of "C" indicates that the risk to that receptor could be as high as "C," or medium, under the conditions considered in the risk assessment. The risk score for BLM Area B sub-area B-2 is considered to be an overestimate because: (1) vegetation clearance was achieved by prescribed burning, which cleared a larger footprint than the sampling grids; (2) no surface MEC item was recovered from the sampling investigation; (3) no munitions item was identified during BLM's habitat restoration and trail maintenance activities in 2011 and 2012; and (4) the MEC density calculations are based on small numbers of items (total three MEC items) providing an upper-bound density for the site. The risk scores determined for BLM Area B sub-areas B-4, B-5, and B-6 are considered to be overestimates because surface and subsurface MEC remediation was conducted in all or most of these sub-areas and UXO Estimator assumes that the items remain within the sub-areas.

5.0 FEASIBILITY STUDY

This section describes the remedial action objectives, incorporation of risk assessment results, potential ARARs, land use control guidelines, and the remedial alternatives developed to address potential risk to future land users from MEC that may remain at the site.

The RI/FS process as outlined in the EPA's *Guidance for Conducting Remedial Investigations* and Feasibility Studies Under CERCLA (EPA, 1989) (EPA's RI/FS Guidance) represents the methodology that the Superfund program has established for characterizing the nature and extent of risk posed by contaminated sites and for evaluating potential remedial options. This FS was prepared based on the process outlined in the Guidance; however, it was adapted for applicability to the specific circumstances associated with potential MEC.

5.1 Remedial Action Objectives

The primary RAOs for BLM Area B and MRS-16, based on EPA's RI/FS Guidance (EPA, 1989), are to achieve the EPA's threshold criteria of "Overall Protection of Human Health and the Environment" and "Compliance with ARARs." These RAOs include supporting the reuse of the area as a habitat reserve in compliance with guidelines and requirements for habitat reserve management and monitoring set forth in the HMP.

As described in EPA's Land Use in the CERCLA Remedy Selection Process (EPA, 2000):

"Remedial action objectives provide the foundation upon which remedial cleanup alternatives are developed. In general, remedial action objectives should be developed in order to develop alternatives that would achieve cleanup levels associated with the reasonably anticipated future land use over as much of the site as possible. EPA's remedy selection expectations described in section 300.43.0 (a) (l) (iii) of the National Contingency Plan (NCP) should also be considered when developing remedial action objectives. Where practicable, EPA expects to treat principal threats, to use engineering controls such as containment for low-level threats, to use institutional controls to supplement engineering controls..."

In keeping with EPA's expectations and based on the planned reuse of BLM Area B and MRS-16 as habitat reserve, the Army intends to (1) treat the principal threats (i.e., conduct MEC remedial actions) and (2) consider institutional controls (herein referred to as Land Use Controls) in the development of remedial alternatives for managing any potentially remaining MEC risks after treatment of principal threats.

5.1.1 Application of Risk Assessment Results

As part of the basewide MR RI/FS process for the former Fort Ord, the Army is required to conduct a MEC RA for MRSs. According to CERCLA, the results of the risk assessment should help establish acceptable remediation goals (e.g., cleanup levels) for use in developing remedial alternatives during the FS. Section 4.0 presents the results of the MEC risk assessment that addresses the explosive hazards associated with MEC in BLM Area B. The potential for explosive hazards are addressed by sub-areas (B-1 through B-6). The sub-areas are presented in Section 3.5 and shown on Figure 3-5. The MRS-16 Interim Action RA Report provided a MEC risk assessment following the interim action completion.

The MEC risk assessments for Fort Ord provide a qualitative description of the potential risks of a receptor encountering an MEC item based on a specific protocol developed to evaluate potential current and future MEC risks at Fort Ord. The qualitative overall MEC Risk Scores are used to guide the comparative evaluation of various remedial alternatives.

Receptors expected to be associated with the planned reuses of habitat preservation and non-motorized recreational uses (hiking, biking, and equestrian) have been divided into two main groups: (1) surface receptors and (2) subsurface receptors.

The RA evaluated MEC risks based on current conditions and overall potential MEC Risk Scores were developed for the anticipated receptors.

The objective of the remedial alternatives evaluation is to support the reuse of BLM Area B and MRS-16 as a habitat reserve. The HMP and additional requirements designate the entirety of the area as an NRMA, and the Reuse Plan (as updated) designates the entirety of the area as Habitat Reserve.

5.1.2 Potential ARARs

This section presents a description and analysis of potential ARARs and other guidance considered in the development and evaluation of remedial alternatives to address the potential presence of MEC and associated MEC risks estimated in the RA for BLM Area B and MRS-16. Table 5-1 summarizes the potential ARARs for remediation of BLM Area B and MRS-16.

Section 121 of CERCLA requires that site cleanups comply with federal and state laws that are ARARs. Under CERCLA Section 121(d)(2), the federal ARARs for a remedial action could include requirements under any of the federal environmental laws. As described in Code of Federal Regulations (CFR), Title 40, Part 300.400(g)(4), only those state standards that are promulgated, are identified by the state in a timely manner, and are more stringent than federal

requirements may be considered as potential ARARs. A requirement may be either "applicable" or "relevant and appropriate."

5.1.2.1 Types of ARARs

ARARs that govern actions at CERCLA sites fall into three broad categories based on the chemical contamination present, site characteristics, and alternatives proposed for cleanup (EPA, 1993). These three categories (chemical-specific, location-specific, and action-specific), and additional "To-Be-Considered" requirements, are described below.

5.1.2.1.1 Chemical-Specific ARARs

Chemical-specific ARARs include those environmental laws and regulations that regulate the release to the environment of materials with certain chemical or physical characteristics or that contain specified chemical compounds. These requirements generally set health or risk-based concentration limits or discharge limits for specific hazardous substances by medium. Chemical-specific ARARs are triggered by the specific chemical contaminants found at a particular site. Examples of potential chemical-specific ARARs are effluent limitations, emission limitations, drinking water standards, and hazardous waste characteristics identified for specific chemicals and compounds. A more stringent standard, requirement, criterion, or limitation promulgated pursuant to a state environmental statute and identified in a timely manner also is a potential ARAR.

5.1.2.1.2 Location-Specific ARARs

Location-specific ARARs govern activities in certain environmentally sensitive areas. These requirements are triggered by the particular location and the proposed activity at the site. An example of a location-specific ARAR is compliance with the Endangered Species Act of 1973, as amended, to avoid sensitive ecosystems or habitats. Location-specific ARARs also focus on wetland or floodplain protection areas, or archaeologically significant areas.

5.1.2.1.3 Action-Specific ARARs

Action-specific ARARs are restrictions that define acceptable treatment and disposal procedures for hazardous substances. These ARARs generally set performance, design, or other similar action-specific controls or restrictions on particular kinds of activities. An example might be a state air quality management authority that sets limitations on fugitive dust generated during grading and excavation activities associated with remedial actions.

5.1.2.1.4 To Be Considered Requirements and Policies

To be considered requirements (TBCs) and other policies, the final class of requirements considered by EPA during the development of ARARs, are non-promulgated advisories, policies, or guidance documents issued by federal or state governments. They do not have the status of ARARs, and are not legally binding, but may be considered in determining the cleanup levels or actions necessary to protect human health and the environment.

5.1.2.2 Definition of ARARs

"Applicable" requirements are defined as those cleanup or control standards, or other substantive environmental protection requirements, criteria, or limitations, promulgated under federal or state laws. Applicable requirements are identified on a site-specific basis by determining whether the jurisdictional prerequisite of a requirement fully addresses the circumstances at the site or the proposed remedial activity. All pertinent jurisdictional prerequisites must be met for the requirement to be applicable. These jurisdictional prerequisites are as follows:

- The party must be subject to the law;
- The substances or activities must fall under the authority of the law;
- The law must be in effect at the time the activities occur;
- The statute or regulation requires, limits, or protects the types of activities; and
- A requirement is applicable if the specific terms (or jurisdictional prerequisites) of the statute or regulation directly addresses the circumstances at the site.

"Relevant and appropriate" requirements refer to those cleanup standards, or other substantive environmental protection requirements, criteria, or limitations promulgated under federal or state law, that while not necessarily applicable, address problems or situations sufficiently similar to those encountered at the CERCLA site, and the use of which is well suited to the particular site (EPA, 1993). The relevance and appropriateness of a requirement can be judged by comparing a number of factors including the characteristics of the remedial action, the item(s) in question, or the physical circumstances of the site, with those addressed in the requirement. If there is sufficient similarity between the requirements and the circumstances at the site, the requirement may be determined to be relevant and appropriate.

Determining whether a requirement is both relevant and appropriate is a two-step process. First, to determine relevance, a comparison is made between the response action, location, or chemicals covered by the requirement and related conditions at the site, release, or potential remedy. A requirement is relevant if it generally pertains to these conditions. Second, to

determine whether the requirement is appropriate, the comparison is refined further by focusing on the nature of the items, the characteristics of the site, the circumstances of the release, and the proposed response action. The requirement is appropriate if its use is well suited to the particular site. The facility must comply with the substantive elements of requirements that are determined to be both relevant and appropriate.

5.1.2.3 Application of ARARs

CERCLA Section 121(d) allows the selection of alternatives that will not attain ARAR status if any of six conditions for a waiver of ARARs exists. However, the selected alternative must be protective even if an ARAR is waived. As noted below, only five of the conditions for a waiver may apply to a DoD site. The conditions for a waiver are as follows:

- The action selected is only part of a total response action that will attain the required level or standard of control when completed;
- Compliance with the designated requirement at that site will result in greater risk to human health and the environment (e.g., worker safety) than alternative options;
- Compliance with the designated requirement is technically impracticable from an engineering perspective;
- The action selected will result in a standard of performance that is equivalent to an applicable requirement through the use of another method or approach;
- A state requirement has not been equitably applied in similar circumstances on other remedial actions within the state; and
- A fund-financed remedial action does not provide a balance between available monies and the need for protection of human health and the environment at sites where the need is more immediate (not applicable to DoD sites).

In addition to ARARs being classified into three broad categories (i.e., chemical-specific, location-specific, and action-specific), each ARAR also is noted by the action that may be taken at the former Fort Ord in the process of implementing the potential remedial alternatives. Thus, during remediation of an area, ARARs may pertain to activities that involve site preparation (such as clearance of vegetation, grubbing, or grading), and/or to excavation or other intrusive activities. In many cases, an ARAR will pertain to more than one type of action.

In determining whether a requirement is pertinent to the remediation of MEC at the former Fort Ord, potential ARARs initially are screened for applicability. If determined not to be applicable, the requirement then is reviewed for both relevance and appropriateness. Requirements that are

considered to be relevant and appropriate command the same importance as applicable requirements.

5.1.2.4 Land Use Control Guidelines

The following guidelines set forth by the EPA, DoD, and DTSC that are relevant to potential Land Use Controls that may be selected for BLM Area B and MRS-16 will be considered in the development and implementation of remedial alternatives.

As described in the *Management Principles for Implementing Response Actions at Closed, Transferring, and Transferred Ranges* (EPA/DoD, 2000):

- Land use controls must be clearly defined, established in conjunction with affected parties, and enforceable.
- Land use controls will be considered as part of the development and evaluation of alternatives for a given Closed, Transferring, or Transferred (CTT) range.
- The DoD (the Army) will conduct periodic reviews to ensure the long-term effectiveness of response actions, including Land Use Controls.

The EPA policy Institutional Controls and Transfer of Real Property under CERCLA Section 120 (h)(3)(A), (B), or (C) (EPA, 2000a) requires the responsible agency to perform the following activities:

- Monitor the institutional controls' effectiveness and integrity.
- Report the results of such monitoring, including notice of violation or failure of control, to the appropriate EPA and/or State regulator, local or Tribal government, and designated party or entity responsible for enforcement.
- Enforce the institutional controls should a violation or failure of controls occur.

In addition, the policy states that "In order to ensure long-term protection of human health and safety in the presence of potential explosive hazards, institutional controls must be enforceable against whomever may gain ownership or control of the property in the future."

The property underlying BLM Area B and MRS-16 is federal property. As described in Section 2.1.3, portions of the property were transferred to BLM in 1996. The remaining acreage will be transferred to BLM in the future. If selected as part of the remedy, land use controls will be specified in the property transfer document or letter of transfer and/or property management document consistent with the federal property management regulations. The Army intends that this will comply with California Code of Regulations Title 22, Division 4.5, Chapter 39, Section

67391.1(e)(2) regarding land use covenants at federal properties in California, and will assure that a mechanism is in place to ensure that future land use will be compatible with the MEC risks that may remain.

5.1.3 Ongoing and Future MEC-Related Activities

This section describes ongoing and future MEC-related activities at the former Fort Ord that are components of the Army's MEC safety education program based on the former military use of Fort Ord. These long-term measures, such as described in the Army's Community Relations Plan (Army, 2013) and the Army's Munitions Response Site Security Program (Army, 2011) are in force regardless of remedial alternatives that may be implemented at a particular MRS or MRA. These measures include the following:

5.1.3.1 MEC Notice

The Army will include a MEC-related notice (or equivalent) in the letter of transfer that (1) informs the new property owner that MEC was found and removed at the reuse area; (2) specifies requirements that must be met prior to performing certain activities at the area; (3) outlines appropriate procedures to be followed in the event that MEC is encountered during development or reuse; and (4) reserves for the Army a perpetual and assignable easement and right of access on, over, and through the property in any case in which a munitions response action is found to be necessary, or such access and entrance is necessary to carry out a munitions response action on adjoining property.

5.1.3.2 Five-Year Review

A review of the basewide MR RI/FS sites will be conducted at five-year intervals after implementation of the selected remedy/remedies, in accordance with CERCLA. The purpose of the five-year review is to determine whether the remedy at a site continues to be protective of human health and the environment after a period of five years from the time the remedy was implemented (or from the time of a previous five-year review). The methods, findings, and conclusions of the five-year review are documented in a Five-Year Review report. In addition, the Five-Year Review report documents provide newly identified site-related data or issues that are identified during the review, and the report identifies recommendations to address them as appropriate. The next five-year review will occur in 2017.

5.1.3.3 MEC Incident Reporting

There is a potential for MEC to be present on the former Fort Ord because military munitions were used throughout its history. In the event MEC is discovered, a process has been developed for reporting such finds to an appropriate local law enforcement agency. The local law

enforcement agency will arrange a response by UXO-qualified personnel, who will be dispatched promptly to dispose of any discovered MEC. This process is documented and must be acknowledged by the future grantee, its successors or assigns. A "Safety Alert" pamphlet and incident reporting instructions are provided to property users.

5.1.3.4 MEC Recognition and Safety Training

The Army offers "MEC recognition and safety training" to anyone conducting ground disturbance activities at the former Fort Ord. The training is a 30-minute session (conducted by the Army or the Army's representative) that includes a lecture on what type of MEC might be found and the procedures to follow if something is found. The "Safety Alert" brochure also is distributed.

5.1.3.5 School Education

Since 1997, the former Fort Ord has had an MEC Safety Education Program that is offered to local schools annually. The objective of this program is to provide school-age children with the ability to recognize the visible attributes of various MEC items likely to exist on the former Fort Ord, associate danger with MEC items and former Fort Ord MEC areas, and understand the actions to be taken when a possible item is observed.

This program has a three-tiered approach that includes: 1) Notice of the availability of the program to local schools and interested community organizations; 2) distribution of the "Safety Alert" to schools, organizations, and agencies who establish public education priorities or provide information to the local community; and 3) presentation of an appropriate MEC safety presentation to local schools and community organizations upon invitation.

Age appropriate materials are distributed during MEC safety presentations depicting appropriate actions for children who may discover MEC. High and middle school students may receive the "Safety Alert and copies of applicable fact sheets and newsletters that support the Army's MEC safety program. Younger students may receive similar materials for their parents and a bilingual children's activity book that incorporates MEC safety messages in stories and puzzles as well as a message to parents concerning how to respond if their child described a possible MEC encounter. The presentation may include displays, demonstrations, and/or video.

5.1.3.6 Community Involvement

The Army is committed to developing opportunities for helping community members to understand and participate in the cleanup decision-making process at the former Fort Ord. The Army holds public meetings, Community Involvement Workshops, Technical Review Committee meetings, and open houses and conducts public information sessions through booths

or tables at local community events. The Army provides public and media tours of former Fort Ord cleanup activities, distributes fact sheets, and makes presentations to special interest and community groups as necessary to address specific community concerns or explain significant cleanup activities. The Army also maintains document repositories (including the administrative record and information repositories at local libraries) available to the public. Additionally, the Army administers a public environmental cleanup web site (www.fortordcleanup.com), maintains a community relations mailing list, mails cleanup updates, and regularly assesses community interest and information source preferences.

The web site provides background information, a description of current activities, documents available for public comment, maps, notices, and agendas for upcoming public meetings. Regular cleanup updates include information on recent cleanup activities and fact sheets, and is mailed and/or e-mailed to those who have requested to be on the community relations mailing list and distributed at community involvement events. Community involvement activities are documented in the Fort Ord Community Relations Plan and in other documents related to community outreach. The Fort Ord cleanup outreach program continues to look for ways to increase accessibility, provide opportunities for the public to learn about the cleanup, and provide a variety of ways for the public to participate. Various outreach events and community participation (attendance) are included in the Community Involvement Record in the Fort Ord Community Relations Plan. In addition, the Fort Ord Annual Report newsletters are distributed regularly to over 50,000 addresses, reaching out to businesses, residences, churches, schools, restaurants, and grocery stores in the communities surrounding Fort Ord.

5.2 Identification of Applicable Response Actions

This section describes the applicable response actions that could mitigate and manage the risk to future land users from any MEC that potentially remains at the site. The response actions considered will include:

- No Further Action This is a baseline for comparison and does not assume a protective and ARAR-compliant state for the designated reuse.
- MEC Remediation Assumes the MEC risks at the reuse area cannot be managed adequately through implementation of controls on the designated reuse; therefore, MEC remediation should be implemented.
- Land Use Controls Assumes the MEC risks at the reuse area can be managed through implementation of controls on the designated reuse.

5.2.1 No Further Action

The No Further Action Alternative is provided, as required under CERCLA and the NCP, as a baseline for comparison to the other proposed remedial alternatives. This alternative assumes no further action related to MEC at BLM Area B or MRS-16 will be taken.

5.2.2 Land Use Controls

The Land Use Controls that are potentially applicable for BLM Area B and MRS-16 are described in the following sections. If selected as part of the remedy for BLM Area B and MRS-16, these Land Use Controls will be implemented in accordance with the guidelines presented in Section 2.2.2.4 (Land Use Control Guidelines), and will be described in further detail in a Land Use Control Implementation Remedial Design/Remedial Action Work Plan (LUCI RD/RAWP). Under the FFA between the Army, EPA, and DTSC, a schedule for preparation of the LUCI RD/RAWP for BLM Area B and MRS-16 will be submitted within 21 days of signature of the ROD.

The Land Use Controls that will be considered for BLM Area B and MRS-16 are described below:

- Land use restriction;
- MEC recognition and safety training and construction support for ground-disturbing or intrusive activities; and
- Public education measures for access management.

5.2.2.1 Land Use Restriction

Conditions on BLM Area B property are specified in the Letter of Transfer dated 18 October 1996. This Letter of Transfer specified MEC-related conditions that (1) informed BLM that MEC had been found and removed from the property; (2) notified BLM that the Army will control public access to "potentially hazardous areas" located on the property and secure this area until studies, characterization, and cleanup of hazardous materials and MEC are completed; and (3) outlined appropriate procedures to be followed in the event that MEC are encountered during reuse. If selected for implementation at BLM Area B or MRS-16, restrictions will be identified in the ROD and described in further detail in a LUCI RD/RA WP.

Land use restrictions regarding MEC risks at BLM Area B or MRS-16 would be documented in property transfer or management documentation to establish the appropriate restriction that indicates:

- Specified reuses evaluated that were designated and approved at the time the Army transfers the property must be maintained by all property owners.
- MEC risks may significantly increase if changes in the designated and approved reuse are implemented.

At the time of each five-year review, the Army or the Army's representatives, in consultation with the property users and regulatory agencies, will assess whether the restrictions continue to be protective or require modifications.

5.2.2.2 MEC Recognition and Safety Training

Personnel involved in conducting intrusive activities would be required to attend the MEC recognition and safety training to increase their awareness of and ability to identify MEC items. Prior to planned intrusive activities, the landowner would be required to notify the Army or Army's representatives and arrange for MEC recognition and safety training to be provided to all workers performing intrusive activities. If selected for implementation at BLM Area B or MRS-16, this training would be described in further detail in a LUCI RD/RAWP. At the time of each five-year review, the Army or Army's representatives would assess the status of the training program and document any recommendations or modifications to the program as described in the LUCI RD/RAWP.

5.2.2.3 Construction Monitoring/UXO-Qualified Personnel Support

Construction monitoring would be performed by UXO-qualified personnel during any intrusive or ground-disturbing construction activities to address MEC risks to construction personnel. Construction monitoring would be arranged during the construction planning stages of the project prior to the start of any intrusive activities. For the purposes of this FS, it is assumed that the two UXO-qualified personnel provided for long-term support of BLM activities in the Impact Area MRA ROD (Army, 2008) would be available to provide the UXO support for BLM Area B and MRS-16. UXO-qualified personnel would monitor construction activities for the potential presence of MEC during any intrusive activities. If evidence of MEC is found during intrusive construction activities, the work would cease; a process has been developed for reporting such finds to an appropriate local law enforcement agency. The local law enforcement agency would arrange a response by UXO-qualified personnel who will promptly be dispatched to address the item (e.g., an EOD unit).

Any MEC-related data that may be discovered during construction monitoring would be reported by the Army under the annual monitoring program, and the monitoring results would be presented in a five-year review report. If selected for implementation at BLM Area B or

MRS-16, the mechanism for providing construction support would be described in further detail in a LUCI RD/RAWP.

At the time of each five-year review, the Army or Army's representatives would assess the status of the construction monitoring program and document any recommendations or modifications to the program as described in the LUCI RD/RAWP.

5.2.2.4 Public Education Measures

Public education measures would inform the public land users (such as recreational users) about the historical military training uses of the areas, response actions conducted, potential for MEC to be present, and actions that should be taken if a suspected munitions item is encountered. Public education measures could be incorporated into existing public access management and outreach programs being implemented by BLM. The Munitions Response Site Security Program and periodic updates (Army, 2005) provide information about site security measures being implemented and maintained at various sites within the former Fort Ord. The site security program is modified as necessary due to changes in the nearby human populations and/or to reflect the status of MEC investigation and cleanup actions. Public education materials would be updated as needed to reflect the current site security status.

For BLM Area B and MRS-16, the following public education measures may be applicable:

- Public education through established or new kiosks to provide information regarding the history of MEC remediation in BLM Area B and MRS-16 and cleanup actions conducted.
- Publication of a brochure to describe the previous use of the property and the current expectations for recreational users (i.e., staying on established trails or roads, no camping, and no digging) including actions to be taken if a suspected munitions item is encountered.

If selected for implementation at BLM Area B and MRS-16, public education measures would be described in further detail in a LUCI RD/RAWP. At the time of each five-year review, the Army or Army's representatives would assess the status of the measures and document any recommendations or modifications to the program as described in the LUCI RD/RAWP.

5.2.3 MEC Remediation

MEC remediation includes the following components:

Vegetation Clearance involves conducting site preparation procedures to clear vegetation
to provide the required ground surface visibility, which would provide safe access to the
site to allow for MEC investigation and removal.

 MEC Remedial Action involves using the best appropriate practices and/or technologies available for MEC detection and removal (remediation), and MEC detonation using DDESB-approved procedures to address recovered MEC items.

Descriptions and applicable methods for implementation of MEC remediation are described below. If selected for implementation at BLM Area B, a site-specific work plan outlining planned (1) vegetation clearance methods (e.g., prescribed burning), (2) MEC removal methodologies, and (3) habitat monitoring protocols would be developed and will be made available for regulatory agency and public review.

5.2.3.1 Vegetation Clearance

Large areas of BLM Area B are densely vegetated; therefore, to provide safe access for workers to conduct MEC removals, vegetation clearance would be required as a first step. The HMP (USACE, 1997), prepared in accordance with the USFWS BOs (USFWS, 1997a, b) presented the boundaries of habitat reserve areas and described land use, conservation, management, and habitat monitoring requirements for target species within BLM Area B and MRS-16. Additional requirements have been identified since the HMP was published, and are described in five BOs (USFWS, 1999, 2002, 2005, 2011, and 2014). The HMP and these additional requirements establish the guidelines for the conservation and management of wildlife and plant species and their habitats that largely depend on former Fort Ord land for survival.

The selection of vegetation clearance methods depends on the type and density of vegetation, types of MEC present, and the planned reuse of the site. Methods of vegetation clearance for different plant communities at the former Fort Ord were evaluated and are described in the *Evaluation of Vegetation Clearance Methods Technical Memorandum, Ordnance and Explosives Remedial Investigation/Feasibility Study, Former Fort Ord, California* (Vegetation Clearance Technical Memorandum; Harding ESE, 2002c). Table 12 of the *Vegetation Clearance Technical Memorandum* presents a matrix of vegetation clearance methods that should be retained for further consideration for the range of different plant communities (or types of vegetation) found at the former Fort Ord.

BLM Area B is designated as habitat reserve, largely covered by CMC. The *Vegetation Clearance Technical Memorandum* evaluated several vegetation clearance methods that may be applicable in CMC and Coastal Scrub communities, and identified prescribed burning as the only method readily available for use in CMC and Coastal Scrub communities. Other vegetation clearance methods were evaluated, but their use is allowable on a limited basis only, or further study is required. Manual and mechanical cutting are allowed for up to 50 acres of unburned CMC within each sub-area of BLM Area B. It has not been shown that cutting of CMC supports

successful recovery of the rare habitat.". The Army has used manual and/or mechanical cutting when prescribed burns cannot be done safely, burning cannot be conducted because the size of the area is too small or lacks existing fuel breaks and access roads, areas have high vegetation moisture content or did not burn or burned incompletely during a prescribed burn, or areas require sampling before scheduled remedial actions and prescribed burns. As stated in the 2014 Biological Opinion (USFWS, 2014), the Army would generally limit manual and mechanical vegetation cutting to 50 acres or less of CMC within each MEC removal site in areas designated in the HMP as habitat reserve, development with reserve areas or development with restrictions, habitat corridor, or habitat corridor with development allowances. The Army has also utilized manual and/or mechanical cutting for the maintenance or establishment of fuel breaks. Manual and mechanical cutting are allowed for vegetation other than CMC and Coastal Scrub.

5.2.3.1.1 Mechanical and Manual Vegetation Clearance

Outside of CMC and Coastal Scrub communities, mechanical and manual vegetation cutting can be used to provide safe access for conducting MEC response actions. Manual methods consist of clearing vegetation using hand tools and chain saws. Mechanical methods use larger equipment such as a brush hog or tractor accessorized zerriest (TAZ).

In most cases, standing vegetation is cut at the base or pruned sufficiently to allow for access and improved visibility under the canopies of trees and shrubs prior to munitions response actions. Grasses, small shrubs, and non-woody material are typically cut off at the base, and larger shrubs are typically pruned and the main stems are cut to a height that allows access for operation of detection equipment and crews. Trees are left in place with lower branches less than four inches in diameter removed to allow access. Cut material is typically chipped and hauled offsite, and in some cases may be redistributed onsite in limited amounts.

The major elements of conducting mechanical and manual cutting for the purposes of vegetation clearance prior to MEC remedial actions are described below according to the parameters of discussion described in the *Vegetation Clearance Technical Memorandum* (Harding ESE, 2002).

How the Method is Carried Out in the Field

Mechanical vegetation clearance consists of using human-operated mechanical equipment in three basic configurations to cut vegetation: tractor pulled, track-carriers with booms, and skid-steer. Equipment operators maneuver the equipment onto the MEC sites to clear the vegetation. Once mobilized, mechanical vegetation clearance can take several weeks to months depending on the size of the area to be cut.

Manual methods involve cutting and clearing vegetation using motorized chainsaws, power chippers, weed eaters, and mowers. Small stem diameter shrubs would typically be cut using a

variety of tools such as loppers or chain saws depending on site-specific conditions. Grass clippings and small shrubs would be either brought to a staging or stockpiling area for chipping or disposal or left in place depending on the amount of material and visibility requirements for performing MEC remedial action and future reuse of the site. Large stem diameter shrubs would be "limbed up" to allow access under the canopy for workers.

Worker Safety

Mechanically and manually cutting vegetation would expose workers to MEC that is potentially present in areas being cleared, which if accidentally detonated, could cause serious injury or possibly death. The type of MEC and associated risks varies from site to site in BLM Area B. The SUXOS and UXO Safety Officer (UXOSO) will be responsible for implementing safe work practices based on site-specific safety considerations and detection equipment capabilities, and workers will receive proper training, awareness, and protective equipment to minimize potential exposure to MEC. The use of machinery could potentially separate the worker from direct contact with MEC.

In areas of dense vegetation, mechanical cutting is performed in two stages. The vegetation clearance teams, with support from UXO-qualified personnel (minimum UXO Technician II), cut vegetation to a height of approximately 18 inches above the ground surface. If MEC/MPPEH or an unknown item is encountered during mastication, vegetation clearance will stop, and the UXO-qualified personnel will investigate the item. The UXO-qualified personnel then uses a magnetometer as needed in conjunction with a visual survey of the ground surface to identify and remove MEC/MPPEH. After the visual survey is performed and the item is resolved, the cutting resumes and vegetation is cut to a height of approximately six inches off of the ground surface.

Public Safety

Public safety would be addressed by establishing and enforcing exclusion zones during the duration of vegetation clearance. Temporary fencing and/or security patrols would be used to prevent possible public exposure.

Erosion

Mechanical vegetation clearance has the potential to cause disturbance and erosion in the short term due to cutting equipment scalping the surface and equipment tires or tracks that could create ruts that lead to erosion. Mechanically cutting vegetation could also cause erosion in the long term because this method is likely to result in lower diversity and abundance of vegetation in habitat reserve areas and in sensitive plant communities.

Manual vegetation clearance could be used on slopes where mastication equipment access is not possible or safe to operate. Manual clearance would cause a minimal soil disturbance in the short term and would remove only plant material that interferes with visibility and access to MEC. However, cutting vegetation could cause soil erosion in the long term within habitat reserve areas and in sensitive plant communities because this method is likely to result in lower diversity and abundance of vegetation as natural re-vegetation recurs.

Impacts to Protected and Other Natural Resources

Mechanical and manual clearance may be performed in either development areas or habitat reserve areas prior to MEC remedial activities, and may have impacts on protected or other natural resources.

Protected Resources

The HMP (USACE, 1997) was developed to protect rare, threatened, and endangered species during base closure and reuse activities at Fort Ord in compliance with the ESA, and specifies requirements for habitat reserve areas. The HMP identifies species and habitats of concern at Fort Ord and outlines mitigation measures to reduce or avoid impacts. The mitigation measures established in the HMP are intended to ensure successful regeneration of special status species and their habitats following remedial actions. The majority of vegetation found in MEC areas at Fort Ord consists of CMC containing several special status species identified in the HMP. The Army intends to use appropriate habitat management methods (e.g., prescribed burning in chaparral habitat reserve areas) outlined in the HMP and BOs that have been approved by the USFWS to enhance habitat recovery. If use of vegetation clearance methods other than prescribed burning is determined to be necessary in chaparral habitat reserve areas greater than 50 acres in size, the Army would need to obtain approval from the USFWS because such action would not be in accordance with the current BOs.

Natural Resources

Mechanical and manual clearance may have impacts on natural resources that occur in areas to be cleared regardless of their protection status. Consideration must be given to plants, animals, air, soil, and water resources when evaluating the impacts of vegetation clearance, and impact avoidance should be practiced. Potential ARARs that may apply to natural resources protection during vegetation clearance activities are presented in Table 5-1. In addition, practical measures such as avoidance of nesting birds or animal dens, and implementation of controls (e.g., installation of silt fences to prevent disturbed soil from eroding into and affecting the quality of nearby water bodies) should be practiced where possible. Site-specific measures for avoiding

impacts to natural resources will be addressed in the site-specific work plan for each remedial activity.

Use at Fort Ord or Other Sites and Under What Conditions

Mechanical and manual vegetation clearance has been used extensively at Fort Ord in development areas on a variety of vegetation types, in habitat reserve containing grassland and shrubs, and on a limited basis in CMC habitat reserve areas where burning cannot be conducted. Mechanical vegetation clearance was used previously in limited areas behind the firing lines to support MEC investigation. Three mechanized methods previously used at Fort Ord include the brush hog, TAZ, and a Bobcat with treads and a mowing deck that is smaller than the first two pieces of equipment and has been used in areas that could not be otherwise accessed by mechanical methods. Vegetation is mowed, cut, or trimmed only to the extent necessary to allow safe access and visibility for UXO technicians. Manually cut vegetation is typically chipped and either used on-site for restoration activities or sent off-site to a local landfill. Mechanically cut material is shredded in the process and left on the ground surface. Mechanical and manual methods can be used in limited CMC habitat reserve areas at Fort Ord in accordance with the BOs where burning cannot be conducted safely, where small remedial areas would be difficult to burn because of their size and lack of existing fire roads, or in areas of high vegetation moisture content.

Availability of Equipment and Personnel

Equipment and personnel necessary for mechanical cutting is readily available.

Regrowth of Vegetation and Maintenance Requirements

Based on past experience at Fort Ord, mechanical and manual methods must be scheduled and implemented to clear vegetation incrementally in conjunction with MEC remedial action so that MEC removals and digital geophysical surveys can be completed before the vegetation regrows significantly.

Protected Species

For any vegetation clearance method implemented at the former Fort Ord, the HMP requires biological resource monitoring before and after MEC remedial activities to ensure success criteria are met in the three habitat reserve plant communities at the former Fort Ord: (1) chaparral and coastal scrub, (2) coastal strand and dune, and (3) wetland/open water habitat. Within habitat reserve areas, recovery of rare, threatened, or endangered species could be inhibited by a thick layer of woody cuttings from onsite chipping and distribution, thus inhibiting germination. Standards for long-term maintenance of vegetation following mechanical clearance

are defined in the HMP and the Vegetation Monitoring Protocol (Burleson, 2009) for CMC, Coastal Strand, and dune communities and in the *Wetland Monitoring and Restoration Plan for Munitions and Contaminated Soil Activities at Former Fort Ord* (Burleson Consulting, Inc., 2006) for wetland communities. The Army is required under the HMP and BOs to monitor for and control invasive species in the remediation areas.

Non-Protected Species

Monitoring is not required by the HMP in the three non-habitat reserve plant communities (coast live oak woodland and savannah, willow scrub dominated riparian, and grassland). Control of invasive weeds and erosion will be addressed during and after the remedial action.

Level of Effort in Terms of Personnel

Mechanical vegetation clearance may consist of two passes: one pass to clear to 18 inches, and a second pass to clear vegetation to six inches. Manual clearance would require vegetation clearance workers accompanied by UXO-qualified personnel. Production rates would depend on numerous indeterminate site-specific factors such as type of vegetation and density; type of MEC and density; and the capabilities of this method under various types of terrain and access conditions.

It is assumed that plant communities containing woody and/or typically dense vegetation (e.g., chaparral and coastal scrub, oak woodland and savannah, and willow riparian dominated communities) would require a higher level of effort, and plant communities containing non-woody and less dense vegetation (e.g., grassland, wetland/open water habitat, and coastal strand and dune communities) would require a lower level of effort.

Visibility of Ground Surface

Safety procedures require the vegetation be cleared to bare ground or approximately six inches above ground surface to allow for access and for proper operation of MEC detection equipment. This level of clearance would be achievable using mechanical cutting; however, the resulting ground surface is typically covered with remaining stems and vegetative cuttings.

5.2.3.1.2 Vegetation Clearance via Prescribed Burning

In CMC, prescribed burning has been successful in removing the vegetation to facilitate followon MEC removal in compliance with the HMP. For the purposes of this FS and costing remedial alternatives, in accordance with the HMP, which specifies requirements for implementation of prescribed burning in habitat reserve areas, it is assumed that:

• Prescribed burn areas would be delineated based on site-specific characteristics and the ability to contain the burn. A site-specific burn plan will be prepared. This burn plan

will describe the location and size of the burn areas and the widths and condition of containment lines.

- Manual and/or mechanical cutting of unburned vegetation may be conducted as necessary to support the prescribed burn.
- Manual and/or mechanical cutting of burned vegetation may be conducted.

ITSI Gilbane subcontracted an evaluation of BLM Area B to Barry Callenberger of Wildland Rx, who acted as the Burn Boss for conducting several prescribed burns at Fort Ord. Mr. Callenberger prepared an evaluation of the feasibility of conducting prescribed burns in BLM Area B. This report, provided as Appendix D, is used to inform the assumptions used for evaluating vegetation removal alternatives in this FS.

The major elements of conducting prescribed burning for the purposes of vegetation clearance prior to MEC remedial actions are described below according to the parameters of discussion described in the *Vegetation Clearance Technical Memorandum* (Harding ESE, 2002).

How the Method is Carried Out in the Field

The major elements of prescribed burning include:

- Preparation of a burn prescription/burn plan outlining the objectives of the burn, burn area, and the range of environmental conditions under which the burn will be conducted; workforce and equipment resources required to ignite, manage and contain the fire; and communication procedures;
- Site preparation, including establishment and maintenance of containment lines;
- Conducting the burn within the range of environmental conditions established in the burn prescription; and
- Follow-up operations to ensure that the fire is fully contained.

Based on past experience and habitat conservation considerations, it is anticipated that prescribed burns would be conducted in defined burn areas. Each contiguous prescribed burn area would not exceed 400 acres unless specifically coordinated with USFWS; under the HMP, no more than 800 acres would be allowed to be prescribed burned in any given year. Once mobilized, the prescribed burn operation would take several days to a week to complete.

Regularly-maintained roads and fuelbreaks that are accessible by vehicles and fire management equipment currently divide the site into several sections. As needed, these sections would be further divided by utilizing established roads and trails to the extent possible that can be expanded as temporary fuel breaks (instead of creating new fuel breaks through thick vegetation

that would involve higher level of effort and potential avoidable habitat impacts). The sizes of the burn areas are contingent on many factors, the most important being the location and condition of major fuelbreaks (well maintained, substantial fuel breaks where a fire could be held from spreading past that location). Other factors considered are topography, slope aspect, fuel type, fuel loading, fire behavior, and the proximity of urban/wildfire interface. The actual size and configuration of burn areas would be determined by the Army fire department in charge. The fire department would determine these parameters to minimize the size and duration of each burn, to best maintain control of the burn, to minimize smoke impacts, to be able to execute the burn within the narrow meteorological window, minding also explosives safety and other technical and practical considerations. The fire department would select areas to strategically create a buffer between the burn area and the surrounding communities to protect the communities from any potential wildfire or fire hazard. Proposed burn areas, containment lines, and supporting rationale would be described in site-specific burn plan that would be made available for regulatory and public review.

Potential Impacts to the Public

A site-specific burn plan will be prepared for each planned burn. This burn plan will describe the location and size of the burn areas, and widths and conditions of containment lines. Each burn plan would outline a range of environmental conditions under which the burn will be conducted, developed with the goals of conducting a fully contained burn and minimizing smoke impacts to the community.

The Army will provide public notification of planned prescribed burns. Notification of the burn season could include several avenues of communication such as posters/flyers and announcements in local newspapers, telephone hotline and websites. The audience and manner of public notification will be specified in the prescribed burn plan. A prescribed burn will be started only when optimum burn conditions are confirmed. Mobilization of fire management personnel and equipment, and public notification, will occur when optimum burn conditions are reasonably expected. Once mobilized, fire and management personnel, equipment, and supplies may be in place and standing by for several days. The Army will wait for appropriate atmospheric conditions and the burn will be implemented once the conditions are met. In addition, multiple burn events may be conducted over a period of several days that could be interrupted by one or more days of no burning. Through community notification, the public will be advised of reasonable precautions they can take to minimize exposure to smoke from prescribed burns, such as staying indoors with doors and windows closed, and limiting outdoor activity when smoke is present.

Development of the burn prescription would include assessment of meteorological conditions and design of the prescription to minimize potential impacts to the public. Prior public notification and smoke management while conducting the burn would minimize potential impacts from smoke. Because a burn will be conducted only when optimum burn conditions are confirmed, it is not possible to schedule a burn on a specific date. The short duration and repetitive nature of these burn events may produce a significant time and travel burden on those attempting to relocate, return, and then relocate several times within days or weeks. For these reasons, the Army has determined it is not possible to implement an effective temporary voluntary relocation program for the community during prescribed burns. Community notification and smoke management minimizes potential impacts from smoke.

Health impacts from short-term exposure to smoke from prescribed burns are temporary based on the results of air monitoring conducted during the prescribed burn in 2003, and an independent analysis of the results conducted by Agency for Toxic Substances and Disease Registry (ATSDR). The Army and regulatory agencies believe these health risks need to be balanced with health and safety risks to MEC removal workers. Conducting a prescribed burn within BLM Area B is not expected to have significant adverse impacts on the public. The prescribed burn would be conducted under optimal climatic conditions to minimize smoke and to control the burn within its intended boundaries.

An assessment of MEC-related air emissions that may be associated with a burn was conducted in the *Technical Memorandum*, *Air Emissions from Incidental Ordnance Detonation During a Prescribed Burn on Ranges 43 through 48, Former Fort Ord, California* (Air Emissions Tech Memo; Harding ESE, 2001), which indicated air pollutant emissions from incidental MEC detonation during a prescribed burn in Ranges 43 through 48 within the Impact Area MRA would be minor compared to emissions contributed directly by biomass burning, and would result in pollutant concentrations well below health-protective regulatory screening levels.

The Army has conducted air monitoring during previous prescribed burning in the Impact Area MRA. Combustion of vegetation has the potential to result in temporary smoke impacts to downwind receptors. The identity and quantity of emissions from prescribed burns at the former Fort Ord have been documented in the Air Emissions Tech Memo, *Draft Final Ranges 43-48 Prescribed Burn Air Monitoring Report, Former Fort Ord, California* (MACTEC, 2004b), and other documents. As a result of the evaluation, particulate matter (10 micrometer in diameter and smaller, or PM₁₀) was identified as the most appropriate indicator of smoke. In 2011, the Army transitioned to sampling for particulate matter 2.5 micrometers in diameter and smaller (PM_{2.5}) in coordination with agencies. Data is collected during the burns to assess the adequacy of the burn prescription relative to smoke dispersion and downwind impacts. The air monitoring

results are evaluated for comparison to regulatory, health-based screening levels. The 24-hour National Ambient Air Quality Standard (NAAQS) for PM_{2.5} is currently used as the screening level.

The possibility of incidental MEC detonation exists for any vegetation clearance method. Mitigation of potential public exposure to flying fragments or blast debris from accidental detonation of UXO during vegetation clearance activities would include: (1) conducting a prefield analysis of the type of UXO known or expected to be present in a given area and its proximity to the public, (2) calculation of the maximum distance flying fragments or blast debris would travel based on the type and size of UXO, and (3) implementation of mitigation measures if necessary to prevent public exposure, including maintaining and enforcing a safety exclusion zone during prescribed burn operations. Potential emissions from detonated UXO are expected to be insignificant and not of concern in terms of human health.

Worker Safety

Burning of vegetation would be conducted using aerial ignition methods (e.g., via helicopter), which would isolate workers from direct exposure to UXO that is potentially present in areas being cleared. Ground crews would be present on fuel break roads, and air sampling or meteorological stations may be placed and maintained near the prescribed burn area. Development and implementation of a health and safety plan for workers would mitigate worker exposure to injury. The health and safety plan will identify appropriate separation distances for workers.

In the case of accidental detonation of UXO, prescribed burn workers would not be likely to be exposed to flying fragments or blast debris because appropriate worker setback distances will be established and observed during burn operations.

Erosion

Vegetation clearance using prescribed burning may result in some surface disturbance or erosion on slopes in the short term, because fire reduces most of the vegetation to bare mineral soil. However, re-vegetation of burned areas is likely to proceed rapidly following the start of the next rain season, thus minimizing further erosion potential. In the long term, burning would have a beneficial impact on the health and growth of the plants and their stability.

Impacts to Protected and Other Natural Resources

Burning would have beneficial impacts on rare, threatened and endangered species because chaparral communities have evolved to be dependent on fire for its health and functioning. Research indicates chaparral communities cleared by burning not only recover, but also flourish providing an opportunity for the greatest diversity of native plants to grow. Plants and animals

in BLM Area B have survived, become dependent on, and adapted to a cycle of occasional fire that recycles nutrients and exposes minerals in the soil while stimulating the germination of seeds that accumulate in between fires. This natural succession allows the plant community to rejuvenate itself and enhances the natural diversity of the unique habitat containing rare, threatened and endangered plants in BLM Area B. Based on observations made during monitoring of habitat recovery after vegetation clearance at Fort Ord (conducted under the HMP monitoring program) burning is supported as the primary method for vegetation clearance for the following reasons:

- Seedlings of HMP shrubs were common in burned areas after clearance activities. An evaluation indicated HMP shrub regeneration occurred in densities over 3,000 seedlings per acre after burning (as compared to only 29 seedlings per acre occurred after cutting).
- Species diversity is generally higher in burned areas.
- More native herbaceous species were observed in burned areas (MACTEC, 2007).

In addition, because the chaparral habitat contains protected species, resource management measures are required by the USFWS as detailed in the BOs, memoranda, and other correspondence between USFWS and the Army (USFWS, 1999, 2001, 2002, 2005, 2007, 2011, 2014; Army, 1998, 2000) and in accordance with the HMP (USACE, 1997). The intent of the USFWS is that "the Army would primarily use prescribed fire to clear vegetation in support of Ordnance and Explosives (OE) removal actions in areas designated as habitat reserves [and]... to preserve, protect, and enhance populations and habitat of listed species and to protect candidate and sensitive species to the extent needed to preclude the need for future listings" (USFWS, 2001). In coordination with USFWS, the Army has cut portions of the Impact Area MRA where burning was determined to be unsafe or impractical.

Use at Fort Ord or Other Sites and Under What Conditions

Prescribed burning has been used extensively at former Fort Ord for decades because of military training activities, and has also been used to clear vegetation from areas similar to and within BLM Area B to support removal actions at the former Fort Ord since 1994. Prescribed burns are conducted in close coordination with federal, state, and local regulatory agencies.

Prescribed burns consist of using fire under optimal climatic conditions to clear vegetation from MRSs, and are the primary vegetation clearance method for habitat reserve areas containing CMC. It is anticipated that temporary fuel breaks will be cut and surface cleared around each burn unit prior to burning. In addition, safety set back distances will be identified that will protect the public during vegetation clearance activities. The details of these measures will be documented in the site-specific implementation work plan.

There is a risk of escaped fires or wildfires involved in burning vegetation. Of the prescribed burns conducted at the former Fort Ord since 1994, two prescribed burns (1997 and 2003) escaped and became wildfires. However, the majority of prescribed burns were successfully conducted without becoming a wildfire, and fire mitigation techniques and personnel are in place under the burn plan to prevent and address such instances.

Availability of Equipment and Personnel

Prescribed burning has been used extensively at the former Fort Ord and the equipment and personnel necessary to implement burning would be available for use at BLM Area B. Equipment can be difficult to obtain during the peak wildfire season. Fort Ord prescribed burns typically occur after the peak wildfire season because of the burn prescription.

Deposition of Vegetation

Depending on the provisions of the burn prescription and the occurrence of suitable conditions, the burn would clear or consume the majority of top growth on shrubs, consume the leaf litter, and burn a portion of the standing woody stems. The extent to which woody material would be consumed is directly related to fuel moisture and ambient conditions at the time of the burn. Under relatively cool, moist conditions, very little woody material would be consumed. Under low-humidity, low-fuel moisture conditions, woody vegetation up to two inches in diameter may burn.

Visibility of Ground Surface

Safety procedures require the vegetation be cleared to bare ground or approximately six inches above ground surface to allow for access and for proper operation of MEC detection equipment. This level of clearance would be achievable using burning. Fire clears the vegetation and leaves the range in a condition that typically provides MEC removal workers with a clear, unobstructed view of the ground surface. Manual and/or mechanical cutting of burned vegetation may be conducted if necessary to conduct MEC removals.

Level of Effort in Terms of Personnel

Prior to the burn, the Army will inform the public of the planned burn through a notice in a local newspaper and/or other avenues of communication that would be described in the burn plan. In addition, vegetation clearance and UXO-qualified personnel would clear and maintain fuel breaks surrounding the burn area and form a containment line. An air monitoring program would be developed and implemented. Any air samples collected would be analyzed offsite. In addition, meteorological profiling would be conducted prior to and during the burn. Prescribed burning would be conducted using aerial methods (such as an operator to pilot a helicopter equipped with a torch to initiate the burn). Fire suppression crews would stand by during the

burn and emergency fire crews from local jurisdictions would be on notice in case the fire traveled in an unplanned direction. After the burn the site will be monitored for fire safety until all operations are completed and fire crew is demobilized. Site-specific procedures would be detailed in prescribed burn plans.

5.2.3.2 MEC Remedial Action

After vegetation clearance is performed, MEC remedial action would be implemented, and could include the following four components, as described below: (1) MEC removal (surface and/or subsurface); (2) MEC detonation; (3) digital mapping of anomalies in surface removal areas; and (4) post-remediation habitat monitoring. A site-specific work plan would be developed for each removal area (e.g., BLM Area B sub-area); outlining protocols for implementation of components (1) through (3), and this plan would be available for regulatory agency and public review.

5.2.3.2.1 MEC Removal

Based on the site characteristics and planned reuses of BLM Area B and MRS-16, MEC removals at BLM Area B or MRS-16 would consist of identifying, investigating, and removing MEC found in one of the following scenarios. Specific procedures would be described in the site-specific work plans that would be available for regulatory agency and public review:

- Technology-Aided Surface MEC Removal Identify and remove MEC detected on the ground surface (with MEC detection instruments available on site for investigation and removal of any MEC present in areas where the ground surface is not visible).
- Subsurface MEC Removal Identify, investigate, and remove MEC/anomalies detected on the surface and in the subsurface to the depth of detection.

After vegetation is cleared, UXO-qualified personnel would walk the site and conduct MEC removals. MEC and any other anomalies identified visually or using the detection equipment would be investigated, and if MEC were found, the items would be detonated using DDESB-approved detonation procedures. A safety exclusion zone will be established and patrolled during MEC removals.

Technology-Aided Surface MEC Removal

This methodology would consist of a technology-aided search of the ground surface and investigation and removal of any MEC. In general, MD or range-related debris found on the ground surface also would be removed. MEC detection instruments would be available on site for investigation and removal of any MEC present in areas where the ground surface is not

visible. The site-specific work plans outlining planned MEC removal protocols would be made available for regulatory agency and public review.

Current technology used for surface MEC removal at the former Fort Ord includes flux-gate magnetometers and frequency-domain electromagnetic induction (FDEMI) metal detectors. Flux-gate magnetometers measure the vertical component of the geomagnetic field along the axis of the sensor. They have been used at the former Fort Ord on the majority of MRSs to detect small, shallow items. However, flux-gate magnetometers only detect ferrous items. FDEMI metal detectors generate one or more defined frequencies to cause a secondary magnetic field form conductive objects. FDEMI detectors are effective in detecting small, shallow items and can detect all metallic objects, not just ferrous.

After MEC removal, quality control and quality assurance activities would be implemented.

Subsurface MEC Removal

This methodology would consist of identification of geophysical anomalies (i.e., detection equipment would be used to locate subsurface items), investigation of the anomalies, and removal of any MEC encountered from the surface and subsurface. MD and range-related debris found/detected during the process also would be removed.

Subsurface removal depths will be determined based on: (1) the type of munition, (2) the typical depth at which the type of MEC is found, and (3) the capabilities of the geophysical detection equipment selected as best suited for site conditions.

The geophysical equipment currently being used for DGM at Fort Ord includes both handheld EM61–MK2As and a towed array that consists of three EM61–MK2As. Schonstedt and White's magnetometers are also used in conducting subsurface MEC removals. Additional geophysical equipment could be considered during the development of the site-specific work plans for each removal area.

Much of the current research in MEC detection technology is focused on developing discrimination capabilities. Using discrimination, features derived from physics-based models can be fit to sensor data to determine the likelihood that a buried item is either MEC or MD. Discrimination requires high quality EM data. Technologies currently being tested include Geonics EM61MK2, cart system, the Metal Mapper EMI system, the TEMTADS 2x2 system, the Berkeley UXO Discriminator portable sensor, and the Man Portable Vector sensor. Depending on availability, these technologies will be considered when determining the best available technology for conducting DGM in BLM Area B or MRS-16.

Within areas selected for subsurface MEC removal, there may be areas that contain significant amounts of MEC and/or metallic debris that preclude the use of typical methods of removal (e.g., "mag and dig"). These areas may require large-scale excavations to remove the MEC present in the subsurface. The HMP and associated BOs currently limit the amount of temporary habitat destruction to 75 acres (USACE, 2005; USFWS, 1999, 2002, 2005, 2007). The Army is required to ensure that habitat and species within any large-scale excavations recover. The impacted areas must be monitored in accordance with the HMP and BOs to determine if the HMP success criteria have been achieved. It may be necessary to conduct active habitat restoration as a corrective action to meet the requirements of the HMP. Depending on the size of these large-scale excavations, it may also be necessary to re-initiate formal consultation with the USFWS in accordance with the requirements of the Endangered Species Act.

During the MEC removals, quality control and quality assurance procedures would be implemented.

5.2.3.2.2 MEC Detonation

The safest and most expeditious methods of detonation will be used in every case. MEC/MPPEH found will be disposed the day on which they are encountered, if possible. Daily detonation operations may not be feasible due to the availability of the POMFD support required. If an item cannot be immediately disposed, it may be left in place, covered, and the location marked via GPS, or moved to a secure location.

The usual and normal method of MEC/MPPEH disposal will be detonation. DDESB-approved detonation procedures will be used and would be described in the implementation work plans. QA and QC would be applied to the detonation procedure and defined in the implementation work plans.

5.2.3.2.3 Digital Mapping of Anomalies

After MEC were removed from the surface, digital mapping would be performed, using the best appropriate technology, to locate and record anomalies identified during the survey. A map of the anomalies would be included in the after-action report to assist future property users to consider this information in land management decision-making. Digital mapping would require manual and/or mechanical cutting of the burned vegetation to provide access for the digital geophysical equipment. Digital geophysical detection equipment and associated SOPs would be determined in the implementation work plan based on site conditions and according to site-specific QC criteria (which can be considered DQOs), ODDS for Fort Ord (Parsons, 2002a), and other guidance. Digital mapping may not be implementable in some areas based on site

conditions (e.g., difficult terrain or tree cover) that prevent equipment access or operation; these areas would be documented in the after-action report and digital mapping records.

5.2.3.2.4 Post-Remediation Habitat Monitoring

The HMP requires that habitat monitoring be conducted following MEC remedial actions to assess the recovery of HMP species. Baseline monitoring would be conducted in each area where MEC remedial action is planned. Follow-up monitoring would be conducted in accordance with the Vegetation Monitoring Plan and Wetland Monitoring and Restoration Plan (Burleson, 2006, 2009) for (1) HMP annual plants, (2) HMP shrubs, and (3) wetland species. Results of monitoring would be documented in annual reports submitted to the USFWS and CDFW.

5.3 Development of Remedial Alternatives

This section presents the development of remedial alternatives for BLM Area B and MRS-16, based on the response actions identified in Section 3.0 and risk scores developed during the RA presented in Section 4.0. This section also presents a discussion of potential ARARs associated with implementation of the remedial alternatives. Long-term management measures are also discussed.

5.3.1 Long Term Management Measures Specific to BLM Area B and MRS-16

This section describes the Long Term Management Measures that are specific to BLM Area B and MRS-16. These measures will be applied to implement and manage the remedial alternatives selected for BLM Area B and MRS-16; as such, they are not risk management measures or response actions and are not screened or evaluated for reuse area-specific applicability. These measures would be described in further detail in the LUCI RD/RAWP.

5.3.1.1 Property Transfer Documentation

The Army transferred portions of BLM Area B to the Department of Interior, BLM, as documented in a Letter of Transfer dated 18 October 1996. This Letter of Transfer specified MEC-related conditions that (1) informed BLM that MEC had been found and removed from the property; (2) notified BLM that the Army will control public access to "potentially hazardous areas" located in the property until studies, characterization, and cleanup of hazardous materials and MEC are completed; and (3) outlined appropriate procedures to be followed in the event that MEC are encountered during reuse. If Land Use Controls are chosen as part of the remedy, any restrictions identified in the ROD would be described in further detail in the LUCI RD/RAWP. Land use restrictions will be documented in accordance with federal property management processes.

5.3.1.2 Annual Monitoring and Five-Year Review Reporting

The Army will monitor BLM Area B and MRS-16 on an annual basis and collect and report any MEC-related data that may be discovered after transfer of the property. The Army will report results of the annual monitoring on a yearly basis. If MEC are encountered at the area during reuse, MEC incident reporting will be performed. Reporting of suspected munitions items discovered on federal property is currently being implemented according to the procedure described in Appendix G, paragraph 6.a.of the *Munitions Response Site Security Program* (Army, 2011). Currently, incidental discoveries of munitions items within federal property are reported directly to the USACE OE Safety Specialist. The information is also provided to EPA and DTSC.

A review of the remedies selected for BLM Area B and MRS-16 will be conducted within five years after implementation. The purpose of the five-year review is to determine whether the remedy at a reuse area continues to be protective of human health and the environment (1) after a period of five years from the time the remedy was implemented, or (2) from the time of a previous five-year review. The results of annual monitoring and the methods, findings, and conclusions of the five-year review will be documented in a five-year review report which will identify any recommendations to address them, as appropriate.

5.3.2 Development of Remedial Alternatives

Remedial alternatives were developed for BLM Area B based on the three general response actions identified above and the characterization of MEC risks as identified in the RA presented in Section 4. The RA characterized risk to potential receptors for eight risk assessment subareas. These sub-areas (B-1, B-2, B-2A, B-3, B-3A, B-4, B-5, and B-6) are the same as the Nature and Extent sub-areas discussed in Section 3.5 and shown on Figure 3-5. In addition, remedial alternatives were developed for MRS-16 based on the three general response actions and characterization of potential risk identified in the RA prepared as part of the *Final MRS-16 Munitions and Explosives of Concern Remedial Action Report, Former Fort Ord, California* (Shaw, 2009). Remedial alternatives are described below and are evaluated and compared in Section 5.5.

5.3.3 Description of Remedial Alternatives

Four potential remedial alternatives were developed for BLM Area B, as described in the following subsections. These are based on the applicable components of the response actions described in Section 5.2 and provide a range of remedial approaches to: (1) address potential MEC risks for those receptors identified in the RA and (2) allow for proper management of BLM Area B and MRS-16 as a habitat reserve.

The detailed analysis of the remedial alternatives presented in Section 5.4 provides further discussion of the assumptions used in estimating costs associated with implementing each of the components of the alternatives.

5.3.3.1 Alternative 1—No Further Action

This alternative assumes no further action would be taken to address MEC risks for those receptors identified in the RA. This alternative is provided as a baseline for comparison to the other remedial alternatives, as required under CERCLA and the NCP.

5.3.3.2 Alternative 2—Land Use Controls

This alternative includes:

- MEC recognition and safety training for people who conduct ground-disturbing or intrusive activities;
- Construction support for ground-disturbing or intrusive activities and UXO-qualified personnel support; and
- Public education (such as including safety information in brochures and kiosks, and providing safety information during public presentations and safety briefings; would be implemented by BLM in a manner similar to BLM's current efforts).

5.3.3.3 Alternative 3—Technology-Aided Surface MEC Remediation, With Subsurface MEC Remediation in Selected Areas, and Land Use Controls

This alternative includes:

- Vegetation clearance using prescribed burning, or manual and/or mechanical cutting, to provide access to conduct MEC removals; method used will depend on vegetation type and removal requirements.
- Technology-aided surface MEC removal and detonation with engineering controls of any MEC identified (not including areas where MEC removals were previously conducted).
- DGM in surface removal areas to provide a record of remaining anomalies to assist BLM in planning future subsurface activities. Areas inaccessible to DGM equipment will be documented.
- Subsurface MEC remediation in selected areas to address specific reuse and risk, determined in coordination with BLM (assumes 10 percent of acreage).

- Implementation of Land Use Controls (MEC recognition and safety training, construction support, and public education, as described in Alternative 2).
- Post-remediation habitat monitoring (collecting data on HMP species and habitats, and performing mapping, data management and evaluation, and reporting).

Subsurface MEC removal in selected areas would be conducted in portions of sub-areas to address specific concerns regarding MEC risk or reuse needs, such as proposed roads, fuel breaks, trails, and habitat restoration sites. For the purpose of the FS, the total area of subsurface MEC removals is assumed to be approximately 10 percent of the surface removal area.

After technology-aided surface MEC removals were completed for the removal area described in the site-specific work plan, DGM would be conducted. Following the geophysical mapping the Army would review the data and submit a Technical Memorandum to EPA and DTSC that would present an evaluation of the work completed to date and, if necessary, describe subsurface removals recommended based on the results of the work in the removal area. Factors that would be considered when determining whether additional actions are necessary include MEC types and amounts and future reuse activity requirements. If no additional work was required, this also would be documented in the Technical Memorandum along with the rationale for no further removal actions.

Each Technical Memorandum would be an addendum to the site-specific work plan. To avoid impacts to the rare, threatened, and endangered species, completion and agency approval of the Technical Memorandum would be expedited to allow any additional actions to be executed before the next growing season. Each Technical Memorandum and associated correspondence would be made available to the public in the Administrative Record.

The Land Use Controls described in Alternative 2 would be implemented following MEC remedial actions.

5.3.3.4 Alternative 4—Subsurface MEC Remediation

This alternative assumes complete subsurface MEC remediation would be conducted throughout selected sub-areas. Subsurface MEC Remediation would include the following components:

 Vegetation clearance using prescribed burning, or manual and/or mechanical cutting, to provide access to conduct MEC removals; method used will depend on vegetation type and removal requirements.

- Surface and subsurface MEC remediation using appropriate detection technologies.
 Additional technologies may be applied in selected areas if required to address specific risks.
- Post-remediation habitat monitoring and restoration as required (collecting data on HMP species and habitats, and perform mapping, data management and evaluation, and reporting).

5.4 Evaluation of Remedial Alternatives

This section presents the evaluation of the four remedial alternatives developed for BLM Area B based on the nine CERCLA evaluation criteria specified in EPA's RI/FS guidance (EPA, 1989).

The CERCLA evaluation criteria are described below. Table 5-2 summarizes the evaluation of potentially applicable remedial alternatives based on these criteria.

Threshold Criteria

- (1) Overall Protection of Human Health and the Environment An alternative must eliminate, reduce, or control potential threats to public health and the environment through treatment or institutional controls.
- (2) Compliance with ARARs The alternative must meet federal and state environmental statutes, regulations, and other requirements that pertain to the site or area unless a waiver is justified.

Balancing Criteria

- (3) <u>Long-Term Effectiveness and Permanence</u> Considers the ability of an alternative to maintain protection of human health and the environment over time.
- (4) Reduction of Toxicity, Mobility, or Volume Through Treatment Evaluates the alternative's use of treatment (for which there is a statutory preference) to reduce the harmful effects of principal contaminants, their ability to move in the environment, and the amount of contamination present.
- (5) Short-Term Effectiveness Considers the length of time needed to implement an alternative and the risks the alternative poses to workers, residents, and the environment during implementation.
- (6) Implementability Considers the technical and administrative feasibility of implementing the alternative, including factors such as the relative availability of goods and services. Technical

feasibility considerations include the availability of services, necessary equipment, and skilled workers to implement a particular alternative. Administrative feasibility includes obtaining necessary permits and regulatory approvals for implementation of the alternative.

(7) Cost — Capital and long-term management (LTM) costs are estimated for each alternative based on quotes for labor, materials, and equipment necessary to implement the alternative. For annual LTM costs, the net present value (NPV) is calculated over the expected period of years it will take to implement the alternative based on real discount rates (similar to interest rates) that vary according to the period of performance for federal projects. For those alternatives whose life-cycle is indeterminate or exceeds 30 years, for the purposes of evaluating and comparing alternatives as specified in EPA's RI/FS Guidance (EPA, 1989), a period of 30 years is used for estimating long term LTM costs. EPA provides guidelines for estimating remedial alternative costs in Office of Soil Waste and Emergency Response (OSWER) Directive 9355.0-75 (January 2013; updated yearly), Office of Management and Budget (OMB), Executive Office of the President, Appendix C. The guidelines for federal projects are applied to cost estimates provided by Army/USACE contractors for the alternatives. These cost estimates are intended to have an accuracy of +50 percent/-30 percent.

Modifying Criteria

- (8) State Acceptance Evaluates technical and administrative issues and concerns that the state may have regarding each alternative. State Acceptance will be addressed in the resulting ROD once comments on the RI/FS report and Proposed Plan have been received (EPA, 1989).
- (9) Community Acceptance Evaluates issues and concerns that the public may have regarding each alternative. Community Acceptance will be addressed in the resulting ROD once comments on the report and Proposed Plan have been received (EPA, 1989).

Evaluation criteria are applied to remedial alternatives by sub-area and to MRS-16.

The following sections present the evaluation of the four remedial alternatives developed for the BLM Area B eight sub-areas (sub-areas B-1 through B-6) and MRS-16 based on each of the nine CERCLA evaluation criteria described above.

5.4.1 Threshold and Balancing Criteria

5.4.1.1 Sub-Area B-1

5.4.1.1.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at sub-area B-1.

<u>Overall Protection of Human Health and the Environment</u> - Instrument-aided surveys conducted in sub-area B-1 were fairly extensive and included site walks conducted by Parsons, during the BRA, and for the site assessment. Most of the site walks were conducted on roads and trails. One DGM transect was conducted in sub-area B-1 during the site assessment where vegetation was cut. While unlikely, there is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, NFA would be protective of human health for recreational users who stay on established roads and trails, but may not be protective of surface or subsurface receptors within sub-area B-1.

<u>Compliance with ARARs</u> – No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – Alternative 1 would not be effective in the short term related to potential MEC because no further action would be taken to mitigate MEC risks.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks, because no further action would be taken to mitigate MEC risks to receptors assumed in the RA.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate MEC risks are not expected.

<u>Cost</u> - There are no costs associated with implementation of this alternative for sub-area B-1.

5.4.1.1.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (requirements for MEC recognition and safety training, construction support, and public education) on sub-area B-1.

<u>Overall Protection of Human Health and the Environment</u> – Technology-aided tracks conducted in sub-area B-1 were fairly extensive and included site walks conducted by Parsons, during the BRA, and for the site assessment. Most of the site walks were conducted on roads and trails. One DGM transect was conducted in sub-area B-1 during the site assessment where vegetation was cut. While unlikely, there is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, the site is protective of human health for recreational users who stay on established roads and trails. LUCs would be protective of human health by having MEC recognition and safety training for site workers, construction support for

intrusive or ground-disturbing activities, and public education for recreational users. LUC measures would provide a higher confidence of safety for future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - No ARARs were identified that apply to implementation of Alternative 2.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because LUCs would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because LUCs would be maintained to mitigate potentially remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment. Potential exposures would be reduced through controls that would mitigate potentially remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage LUCs to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For sub-area B-1, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for sub-area B-1 is \$67,000, which includes \$985 in capital costs and \$65,689 in annual costs. The cost estimate for Alternative 2 for sub-area B-1 is presented in Appendix E, Table E-2.

5.4.1.1.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Alternative 3 offers a combination of two approaches. This alternative includes a technology-aided surface MEC removal, and subsurface MEC removal in selected areas to address specific risk and/or reuse needs. For sub-area B-1, Alternative 3 assumptions include:

- Prescribed burning to remove vegetation because the majority of vegetation in sub-area
 B-1 is CMC;
- Technology-aided surface MEC removal;
- DGM;
- Subsurface MEC removal in selected areas (approximately 10 percent of the acreage);

- Habitat monitoring and restoration, as needed; and
- Land Use Controls (MEC recognition and safety training, construction support, and public education).

Overall Protection of Human Health and the Environment — While unlikely, there is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, Alternative 3 would be protective of human health. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action. Under the assumptions for sub-area B-1, vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke management while conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public.

<u>Compliance with ARARs</u> - This alternative would be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 3 for sub-area B-1, preparation for the prescribed burn would take approximately one month and the duration of MEC removal following the prescribed burn would be approximately five months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks on the surface and in limited areas of the subsurface. The combination of technology-aided surface MEC remediation, with subsurface MEC remediation in selected areas, and LUCs would support safe reuse activities and allow for proper management of the habitat reserve as described in the HMP and additional requirements.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because, if MEC are detected on the surface, it would be removed, and MEC detected in the subsurface would be removed in selected areas

where greater risk reduction would further support reuse. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals in selected areas could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance through prescribed burning prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data. Conducting DGM can be difficult to implement where terrain and/or tree cover limit data collection.

In addition, after MEC remediation is completed, Land Use Controls are expected to be easy to implement during reuse to protect human health.

<u>Cost</u> – Alternative 3 for sub-area B-1 is estimated to have a total cost of \$3,252,000. The cost includes \$3,186,000 capital costs and \$66,000 in annual costs. The cost estimate and assumptions for Alternative 3 for sub-area B-1 is presented in Appendix E, Table E-3.

5.4.1.1.4 Alternative 4: Subsurface MEC Remediation

Alternative 4 provides for complete subsurface MEC removal and would provide protection of human health by removing all detected MEC on the surface and in the subsurface. Assumptions for Alternative 4 in sub-area B-1 are

- Prescribed burning to remove vegetation;
- Technology-aided surface MEC removal;
- Subsurface MEC removal in the entire footprint of the sub-area; and
- Habitat monitoring and restoration, as needed.

<u>Overall Protection of Human Health and the Environment</u> – While unlikely, there is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, complete subsurface MEC removal would be protective of human health. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action. Under the assumptions for sub-area B-1, vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation

clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke management while conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public. Subsurface MEC removals would be conducted in a manner that is compliant with the HMP.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for sub-area B-1, preparation for the prescribed burn would take approximately one month and the duration of MEC removal following the prescribed burn would be approximately nine months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in sub-area B-1. All subsurface removals will be to the depth of detection.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because all detected MEC would be removed.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and complete subsurface MEC removals could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require prescribed burning prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

<u>Cost</u> - Alternative 4 for sub-area B-1 is estimated to have a total cost of \$4,633,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for sub-area B-1 is presented in Appendix E, Table E-4.

5.4.1.2 Sub-Area B-2

Sub-area B-2 is approximately 143 acres located in the southern portion of MRS-10B. Sub-area B-2 was used for bivouac and maneuver training. Military munitions that would have been used for these types of training are practice and pyrotechnic items that are not designed to cause injury. Sub-area B-2 has been investigated by SS/GS sampling, and two MEC items consistent with the historical training were found in the subsurface. The sampling investigation, including prescribed burning of the sampling site, resulted in no recovery of surface MEC items.

While projectile use was suggested based on an interview, no evidence was found to support such use. Within MRS-10B, grids where fragmentation hand grenades and projectiles are suspected or found have been incorporated into sub-areas B-2A and B-4. Items found in MRS-10A immediately west of sub-area B-2 are not indicative of presence of projectiles in the sub-area.

One other MEC item historically found in the sub-area B-2 was an incidental item (a practice grenade fuze) found in 2000 by BLM. In 2011 and 2013, BLM conducted habitat restoration in 12 acres with no incidental munitions reported.

As described in Section 4, the risk assessment is based on conservative assumptions and provided an Overall MEC Risk Score of "D" for surface receptors and "E" for subsurface receptors. Given the historical training uses, investigation history and items found, MEC is possible to be present, although surface receptor exposure is unlikely. The types of MEC that may be present would be practice and/or pyrotechnic types that are not designed to cause injury. Given the compilation of the available information for the area, the Overall MEC Risk Score is considered an overestimate.

5.4.1.2.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at sub-area B-2.

Overall Protection of Human Health and the Environment – Site walks and SS/GS sampling investigation were conducted in sub-area B-2. BLM has also engaged in ground disturbance activities as part of habitat restoration and trail maintenance across sub-area B-2. The three MEC items found in sub-area B-2 are consistent with maneuver training known to have occurred in sub-area B-2. While unlikely, there is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, NFA would be protective of human health for recreational users who stay on established roads and trails but may not be protective of human health for workers within the sub-area.

Compliance with ARARs - No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – This alternative would not be effective in the short term related to potential MEC because no further action would be taken to mitigate MEC risks.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks, because no further action would be taken to mitigate MEC risks to receptors assumed in the RA.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate MEC risks are not expected.

<u>Cost</u> - There are no costs associated with implementation of this alternative for sub-area B-2.

5.4.1.2.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (MEC recognition and safety training, construction support, and public education) on sub-area B-2 and would be protective of human health for the receptors assumed in the RA.

<u>Overall Protection of Human Health and the Environment</u> – While unlikely, there is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, the site is protective of human health for recreational users who stay on established roads and trails. LUCs would be protective of human health by having MEC recognition and safety training for site workers, construction support for intrusive or ground-disturbing activities, and public education for recreational users. LUC measures would provide a higher confidence of safety for future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - There are no ARARs that apply to implementation of this alternative.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because LUCs would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because LUCs would be maintained to mitigate potential remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment. However, potential exposures would be reduced through controls that would mitigate potential remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage LUCs to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For sub-area B-2, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for sub-area B-2 is \$86,000, which includes \$1,278 in capital costs and \$85,181 in annual costs. The cost estimate for Alternative 2 for sub-area B-2 is presented in Appendix E, Table E-2.

5.4.1.2.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Assumptions for Alternative in sub-area B-2 include:

- Prescribed burning to remove vegetation because the sub-area is mainly CMC habitat where prescribed burning is the preferred method for vegetation removal;
- Technology-aided surface MEC removal;
- DGM;
- Subsurface MEC removal in selected areas (approximately 10 percent of the acreage);
- Habitat monitoring and restoration, as needed; and
- Land Use Controls (MEC recognition and safety training, construction support, and public education).

<u>Overall Protection of Human Health and the Environment</u> - While unlikely, there is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, Alternative 3 would be protective of human health. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

Under the assumptions for sub-area B-2, vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke management while

conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public.

LUC measures implemented following MEC remediation would provide an additional level of safety for future land users.

<u>Compliance with ARARs</u> - This alternative would be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 3 for sub-area B-2, preparation for the prescribed burn would take approximately one month and the duration of MEC removal following the prescribed burn would be approximately six months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks on the surface and in limited areas of the subsurface. The combination of technology-aided surface MEC remediation, with subsurface MEC remediation in selected areas, and LUCs would support safe reuse activities and allow for proper management of the habitat reserve as described in the HMP and additional requirements.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because, if MEC are detected on the surface, it would be removed, and MEC detected in the subsurface would be removed in selected areas where greater risk reduction would further support reuse. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals in selected areas could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require prescribed burning prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of

anomalies, and managing and reporting MEC-related data. Conducting DGM can be difficult to implement where terrain and/or tree cover limit data collection.

In addition, after MEC remediation is completed, LUCs are expected to be easy to implement during reuse to protect human health.

<u>Cost</u> - Alternative 3 for sub-area B-2 is estimated to have a total cost of \$3,808,000. The cost includes \$3,772,000 capital costs and \$86,000 in annual costs. The cost estimate and assumptions for Alternative 3 for sub-area B-2 is presented in Appendix E, Table E-5.

5.4.1.2.4 Alternative 4: Subsurface MEC Remediation

Assumptions for Alternative 4 in sub-area B-2 are

- Prescribed burning to remove vegetation;
- Technology-aided surface MEC removal;
- Subsurface MEC removal in the entire footprint of the subarea; and
- Habitat monitoring and restoration, as needed.

<u>Overall Protection of Human Health and the Environment</u> – Investigation was conducted in subarea B-2, but was limited to SS/GS grids following prescribed burns and site walks. While unlikely, there is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, complete subsurface MEC removal would be protective of human health. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

Under the assumptions for sub-area B-2, vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke management while conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public.

Subsurface MEC removals would be conducted in a manner that is compliant with the HMP.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for sub-area B-2, preparation for the prescribed burn would take approximately one month and the duration of MEC removal following the prescribed burn would be approximately nine months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in sub-area B-2. All subsurface removals will be to the depth of detection.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because all detected MEC would be removed. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require prescribed burning prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

<u>Cost</u> - Alternative 4 for sub-area B-2 is estimated to have a total cost of \$5,497,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for sub-area B-2 is presented in Appendix E, Table E-6.

5.4.1.3 Sub-Area B-2A

5.4.1.3.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at sub-area B-2A.

<u>Overall Protection of Human Health and the Environment</u> - Investigation was conducted in subarea B-2A, but was limited to SS/GS and random grid sampling following prescribed burns. Multiple items were found during the munitions responses. There is a possibility that MEC are present in densely vegetated areas away from the roads and trails. NFA would be protective of

human health for recreational users who stay on established roads and trails but may not be protective of human health for workers within the sub-area.

<u>Compliance with ARARs</u> - No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – Alternative 1 would not be effective in the short term related to potential MEC because no further action would be taken to mitigate MEC risks.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks, because no further action would be taken to mitigate MEC risks to receptors assumed in the RA.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate MEC risks are not expected.

<u>Cost</u> - There are no costs associated with implementation of this alternative for sub-area B-2A.

5.4.1.3.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (MEC recognition and safety training, construction support, and public education) on sub-area B-2A.

<u>Overall Protection of Human Health and the Environment</u> - Multiple items were found during the munitions responses and there is a possibility that MEC are present in sub-area B-2A. Therefore, the site is protective of human health for recreational users who stay on established roads and trails. LUCs would be protective of human health by having MEC recognition and safety training for site workers, construction support for intrusive or ground-disturbing activities, and public education for recreational users. LUC measures would provide a higher confidence of safety for future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - There are no ARARs that apply to implementation of this alternative.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because LUCs would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because LUCs would be implemented to mitigate potentially remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment. However, potential exposures would be reduced through controls that would mitigate potentially remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage LUCs to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For sub-area B-2A, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for sub-area B-2A is \$45,000, which includes \$658 in capital costs and \$43,872 in annual costs. The cost estimate for Alternative 2 for sub-area B-2A is presented in Appendix E, Table E-2.

5.4.1.3.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Assumptions for Alternative 3 in sub-area B-2A include:

- Mechanical/manual cutting to remove vegetation because the size of the sub-area limits the ability to conduct a successful prescribed burn;
- Technology-aided surface MEC removal;
- DGM;
- Subsurface MEC removal in selected areas (approximately 10 percent of the acreage);
- Habitat monitoring and restoration, as needed; and
- Land Use Controls (MEC recognition and safety training, construction support, and public education).

<u>Overall Protection of Human Health and the Environment</u> - Investigation was conducted in subarea B-2A, but was limited to SS/GS and random grid sampling following prescribed burns. Multiple items were found during the munitions responses. There is a possibility that MEC are present in sub-area B-2A. Therefore, Alternative 3 would be protective of human health by removing potential MEC from the surface throughout sub-area B-2A and from the subsurface in limited areas. Following MEC removal, LUCs would maintain the protectiveness of human

health. A safety exclusion zone will be established during mechanical/manual vegetation cutting and MEC removal to further protect the public. The preferred method for vegetation removal in CMC habitat is prescribed burning. The use of mechanical/manual cutting is assumed because the small size of sub-area B-2A and the lack of existing fire roads at the perimeter make it difficult to conduct a successful prescribed burn. Potential impacts to the environment by mechanical/manual cutting will be mitigated to the extent possible and would be managed by habitat monitoring and restoration as needed.

<u>Compliance with ARARs</u> - This alternative would be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 3 for sub-area B-2A, vegetation removal would take approximately one month and the duration of MEC removal would be approximately four months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks on the surface and in limited areas of the subsurface. The combination of technology-aided surface MEC remediation, with subsurface MEC remediation in selected areas, and LUCs would support safe reuse activities and allow for proper management of the habitat reserve as described in the HMP and additional requirements.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because MEC detected on the surface would be removed, and MEC detected in the subsurface would be removed in selected areas where greater risk reduction would further support reuse.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals in selected areas could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require mechanical/manual vegetation clearance prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface

via intrusive investigation of anomalies, and managing and reporting MEC-related data. Conducting DGM can be difficult to implement where terrain and/or tree cover limit data collection.

In addition, after MEC remediation is completed, LUCs are expected to be easy to implement during reuse to protect human health.

<u>Cost</u> - Alternative 3 for sub-area B-2A is estimated to have a total cost of \$1,709,000. The cost includes \$1,664,000 capital costs and \$44,000 in annual costs. The cost estimate and assumptions for Alternative 3 for sub-area B-2A is presented in Appendix E, Table E-7.

5.4.1.3.4 Alternative 4: Subsurface MEC Remediation

Assumptions for Alternative 3 in sub-area B-2A include:

- Mechanical/manual cutting to remove vegetation;
- Technology-aided surface MEC removal;
- Subsurface MEC removal in the entire footprint of the sub-area; and
- Habitat monitoring and restoration, as needed.

Overall Protection of Human Health and the Environment —Multiple items were found during the SS/GS sampling investigations. There is a possibility that MEC are present in sub-area B-2A. Therefore, complete subsurface MEC removal would be protective of human health. A safety exclusion zone will be established during mechanical/manual cutting and MEC removal to further protect the public. Under the assumptions for sub-area B-2A, vegetation removal would be accomplished by mechanical/ manual cutting. The preferred method for vegetation removal in CMC habitat is prescribed burning. The use of mechanical/manual cutting is assumed because the small size of sub-area B-2A and the lack of existing fire roads at the perimeter make it difficult to conduct a successful prescribed burn. Potential impacts to the environment by mechanical/manual cutting will be mitigated to the extent possible and would be managed by habitat monitoring and restoration, as needed. Subsurface MEC removals would be conducted in a manner that is compliant with the HMP.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct

work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for sub-area B-2A, vegetation removal would take approximately one month and the duration of MEC removal would be approximately 13 months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in sub-area B-2A. All subsurface removals will be to the depth of detection.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because all detected MEC would be removed.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

<u>Cost</u> - Alternative 4 for sub-area B-2A is estimated to have a total cost of \$4,503,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for sub-area B-2A is presented in Appendix E, Table E-8.

5.4.1.4 Sub-Area B-3

5.4.1.4.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at sub-area B-3.

<u>Overall Protection of Human Health and the Environment</u> - Limited investigation was conducted in sub-area B-3. There is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, NFA would be protective of human health for recreational users who stay on established roads and trails but may not be protective of human health for workers within the sub-area.

Compliance with ARARs - No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – This alternative would not be effective in the short term related to potential MEC because no further action would be taken to mitigate MEC risks.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks, because no further action would be taken to mitigate MEC risks to receptors assumed in the RA.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate MEC risks are not expected.

<u>Cost</u> - There are no costs associated with implementation of this alternative for sub-area B-3.

5.4.1.4.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (MEC recognition and safety training, construction support, and public education) on sub-area B-3.

<u>Overall Protection of Human Health and the Environment</u> - Limited investigation was conducted in sub-area B-3. There is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, the site is protective of human health for recreational users who stay on established roads and trails. LUCs would be protective of human health by having MEC recognition and safety training for site workers, construction support for intrusive or ground-disturbing activities, and public education for recreational users. LUC measures would provide a higher confidence of safety for future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - There are no ARARs that apply to implementation of this alternative.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because LUCs would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because LUCs would be maintained to mitigate potentially remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment. However, potential exposures would be reduced through controls that would mitigate potentially remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage LUCs to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For sub-area B-3, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for sub-area B-3 is \$435,000, which includes \$6,423 capital costs and \$428,171 in annual costs. The cost estimate for Alternative 2 for sub-area B-3 is presented in Appendix E, Table E-2.

5.4.1.4.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Assumptions for Alternative 3 in sub-area B-3 include:

- Prescribed burning to remove the majority of the vegetation and mechanical/manual vegetation removal in portions of the sub-area;
- Technology-aided surface MEC removal;
- DGM:
- Subsurface MEC removal in selected areas (approximately 10 percent of the acreage);
- Habitat monitoring and restoration, as needed; and
- Land Use Controls (MEC recognition and safety training, construction support, and public education).

Because of the size of sub-area B-3, it is estimated that three prescribed burns would be conducted over one or more years to clear the vegetation. Option 1 provided in Appendix D was used to provide the inputs for evaluating prescribed burns in sub-area B-3 as part of this alternative. In areas not included in the Option 1 burn areas, manual/mechanical cutting would be implemented to remove vegetation.

<u>Overall Protection of Human Health and the Environment</u> – Visual and technology-aided site walks on roads and trails, MEC sampling in select grids, and one DGM transect were conducted in sub-area B-3. There is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, Alternative 3 would be protective of human health. Under the assumptions for sub-area B-3, the majority of the vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke management while

conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public.

In the areas where mechanical/manual cutting would be implemented, potential impacts to the environment will be mitigated to the extent possible and would be managed by habitat monitoring and restoration, as needed. In addition, a safety exclusion zone will be established during vegetation removal and MEC removal to further protect the public.

<u>Compliance with ARARs</u> - This alternative would be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing public safety exclusion zones, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 3 for sub-area B-3, the duration of vegetation removal and MEC removal could be approximately four years.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks on the surface and in limited areas of the subsurface. The combination of technology-aided surface MEC remediation, with subsurface MEC remediation in selected areas, and LUCs would support safe reuse activities and allow for proper management of the habitat reserve as described in the HMP and additional requirements.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because MEC detected on the surface would be removed, and MEC detected in the subsurface would be removed in selected areas where greater risk reduction would further support reuse.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals in selected areas could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation

of anomalies, and managing and reporting MEC-related data. Conducting DGM can be difficult to implement where terrain and/or tree cover limit data collection.

Potential impacts to the environment by mechanical/manual cutting will be mitigated to the extent possible and would be managed by habitat monitoring and restoration, as needed. In addition, after MEC remediation is completed, Land Use Controls are expected to be easy to implement during reuse to protect human health.

<u>Cost</u> - Alternative 3 for sub-area B-3 is estimated to have a total cost of \$21,922,000. The cost includes \$21,493,000 capital costs and \$429,000 in annual costs. The cost estimate and assumptions for Alternative 3 for sub-area B-3 is presented in Appendix E, Table E-9.

5.4.1.4.4 Alternative 4: Subsurface MEC Remediation

Assumptions for Alternative 4 in sub-area B-3 include:

- Prescribed burning to remove the majority of the vegetation and mechanical/manual vegetation removal in portions of the sub-area;
- Technology-aided surface MEC removal;
- Subsurface MEC removal in the entire footprint of the sub-area;
- Habitat monitoring and restoration, as needed.

Because of the size of sub-area B-3, it is estimated that three prescribed burns would be conducted over one or more years to clear the vegetation. Option 1 provided in Appendix D was used to provide the inputs for evaluating prescribed burns in sub-area B-3 as part of this alternative. In areas not included in the Option 1 burn areas, manual/mechanical cutting would be implemented to remove vegetation.

Overall Protection of Human Health and the Environment – Limited investigation was conducted in sub-area B-3. There is a possibility that MEC are present in the densely vegetated areas away from the roads and trails. Therefore, complete subsurface MEC removal would be protective of human health. Under the assumptions for sub-area B-3, the majority of the vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke management while conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public.

In the areas requiring mechanical/manual cutting, potential impacts to the environment will be mitigated to the extent possible and would be managed by habitat monitoring and restoration, as needed. In addition, a safety exclusion zone will be established during vegetation removal and MEC removal to further protect the public.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for sub-area B-3, the duration of vegetation removal and MEC removal following the prescribed burn would be approximately five years.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in Sub-area B-3. All subsurface removals will be to the depth of detection.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because all detected MEC would be removed.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

Potential impacts to the environment by mechanical/manual cutting will be mitigated to the extent possible and would be managed by habitat monitoring and restoration, as needed. Subsurface MEC removals would be conducted in a manner that is compliant with the HMP.

<u>Cost</u> - Alternative 4 for sub-area B-3 is estimated to have a total cost of \$37,127,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for sub-area B-3 is presented in Appendix E, Table E-10.

5.4.1.5 Sub-Area B-3A

5.4.1.5.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at sub-area B-3A.

<u>Overall Protection of Human Health and the Environment</u> - Multiple site walks were conducted in sub-area B-3A on accessible trails, roads, and surrounding areas. While unlikely, there is a possibility that MEC are present in densely vegetated areas away from the roads and trails. Therefore, NFA would be protective of human health for recreational users who stay on established roads and trails, but may not be protective of surface or subsurface receptors off of the roads and trails in sub-area B-3A.

Compliance with ARARs - No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – Alternative 1 would not be effective in the short term related to potential MEC because no further action would be taken to mitigate MEC risks.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks, because no further action would be taken to mitigate MEC risks to receptors assumed in the RA.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate MEC risks are not expected.

<u>Cost</u> - There are no costs associated with implementation of this alternative for sub-area B-3A.

5.4.1.5.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (MEC recognition and safety training, construction support, and public education) on sub-area B-3A.

<u>Overall Protection of Human Health and the Environment</u> - While unlikely, there is a possibility that MEC are present in densely vegetated areas away from the roads and trails. Therefore, the site is protective of human health for recreational users who stay on established roads and trails. LUCs would be protective of human health by having MEC recognition and safety training for site workers, construction support for intrusive or ground-disturbing activities, and public education for recreational users. LUC measures would provide a higher confidence of safety for

future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - There are no ARARs that apply to implementation of this alternative.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because LUCs would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because LUCs would be implemented and maintained to mitigate potentially remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment; however, potential exposures would be reduced through controls that would mitigate potentially remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage Land Use Controls to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For sub-area B-3A, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for sub-area B-3A is \$38,000, which includes \$559 in capital costs and \$37,256 in annual costs. The cost estimate for Alternative 2 for sub-area B-3A is presented in Appendix E, Table E-2.

5.4.1.5.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Assumptions for Alternative 3 in sub-area B-3A include:

- Prescribed burning to remove vegetation because sub-area B-3A contains CMC habitat;
- Technology-aided surface MEC removal;
- DGM;
- Subsurface MEC removal in select areas (approximately 10 percent of the acreage);
- Habitat monitoring and restoration, as needed; and
- Land Use Controls (MEC recognition and safety training, construction support, and public education).

<u>Overall Protection of Human Health and the Environment</u> - While unlikely, there is a possibility that MEC are present in densely vegetated areas away from the roads and trails. Therefore, Alternative 3 would be protective of human health and would manage potential risks. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

Under the assumptions for sub-area B-3A, vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke management while conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public.

<u>Compliance with ARARs</u> - This alternative would be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 3 for sub-area B-3A, preparation for the prescribed burn would take approximately one month and the duration of MEC removal following the prescribed burn would be approximately three months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks on the surface and in limited areas of the subsurface. The combination of technology-aided surface MEC remediation, with subsurface MEC remediation in selected areas, and LUCs would support safe reuse activities and allow for proper management of the habitat reserve as described in the HMP and additional requirements.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because, if MEC is detected on the surface, it would be removed, and MEC detected in the subsurface would be removed in selected areas where greater risk reduction would further support reuse. At a minimum, uncertainty about

potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals in selected areas could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require prescribed burning prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data. Conducting DGM can be difficult to implement where terrain and/or tree cover limit data collection.

In addition, after MEC remediation is completed, Land Use Controls are expected to be easy to implement during reuse to protect human health.

<u>Cost</u> - Alternative 3 for sub-area B-3A is estimated to have a total cost of \$2,442,000. The cost includes \$2,404,000 in capital costs and \$38,000 in annual costs. The cost estimate and assumptions for Alternative 3 for sub-area B-3A is presented in Appendix E, Table E-11.

5.4.1.5.4 Alternative 4: Subsurface MEC Remediation

Assumptions for Alternative 4 in sub-area B-3A include:

- Prescribed burning to remove vegetation;
- Technology-aided surface MEC removal;
- Subsurface MEC removal in the entire footprint of the sub-area; and
- Habitat monitoring and restoration, as needed.

<u>Overall Protection of Human Health and the Environment</u> – While unlikely, there is a possibility that MEC are present in densely vegetated areas away from the roads and trails. Therefore, complete subsurface MEC removal would be protective of human health. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

Under the assumptions for sub-area B-3A, the majority of the vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke

management while conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public. Subsurface MEC removal would be conducted in a manner that is compliant with the HMP.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for sub-area B-3A, preparation for the prescribed burn would take approximately one month and the duration of MEC removal following the prescribed burn would be approximately five months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in Sub-area B-3A. All subsurface removals will be to the depth of detection.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because all detected MEC would be removed.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

<u>Cost</u> - Alternative 4 for sub-area B-3A is estimated to have a total cost of \$3,167,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for sub-area B-3A is presented in Appendix E, Table E-12.

5.4.1.6 Sub-Area B-4

5.4.1.6.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at sub-area B-4.

<u>Overall Protection of Human Health and the Environment</u> - Surface and subsurface MEC removals (removal depths varied from 1-ft to 4-ft bgs) were conducted in sub-area B-4. It is unlikely that surface MEC remains in sub-area B-4. In portions of B-4, receptors that intrude below the surface potentially could encounter subsurface MEC. Therefore, NFA would be protective of human health for recreational users who stay on established roads and trails but may not be protective of human health for subsurface receptors off of the roads and trails in sub-area B-4.

Compliance with ARARs - No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – Alternative 1 would not be effective in the short term related to potential MEC because no further action would be taken to mitigate MEC risks.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks, because no further action would be taken to mitigate MEC risks to receptors assumed in the RA.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - Surface and subsurface MEC removals were conducted in sub-area B-4. This alternative would not provide further reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate MEC risks are not expected.

Cost - There are no costs associated with implementation of this alternative for sub-area B-4.

5.4.1.6.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (MEC recognition and safety training, construction support, and public education) on sub-area B-4.

<u>Overall Protection of Human Health and the Environment</u> - Surface and subsurface MEC removals were conducted in sub-area B-4. It is unlikely that surface MEC remains in sub-area B-4. In portions of B-4, receptors that intrude below the surface potentially could encounter subsurface MEC. Therefore, the site is protective of human health for recreational users who

stay on established roads and trails. LUCs would be protective of human health by having MEC recognition and safety training for site workers, construction support for intrusive or ground-disturbing activities, and public education for recreational users. LUC measures would provide a higher confidence of safety for future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - There are no ARARs that apply to implementation of this alternative.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because LUCs would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because LUCs would be maintained to mitigate potentially remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide further reduction of these parameters through treatment. However, potential exposures would be reduced through controls that would mitigate potentially remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage LUCs to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For sub-area B-4, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for sub-area B-4 is \$209,000, which includes \$3,088 in capital costs and \$205,889 in annual costs. The cost estimate for Alternative 2 for sub-area B-4 is presented in Appendix E, Table E-2.

5.4.1.6.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Surface MEC remediation was conducted in sub-area B-4. Therefore, Alternative 3 for sub-area B-4 would include vegetation removal and subsurface MEC remediation in a limited portion selected to address specific reuse and risk, and determined in coordination with BLM. Vegetation would be removed by manual/mechanical cutting. LUCs would be applied to sub-area B-4 to mitigate any potentially remaining MEC risks.

<u>Overall Protection of Human Health and the Environment</u> - Surface and subsurface MEC removals (removal depths varied from 1-ft to 4-ft bgs) were conducted in sub-area B-4. It is unlikely that surface MEC remains in sub-area B-4. In portions of B-4, subsurface MEC

remediation would be conducted in areas where receptors that intrude below the surface potentially could encounter subsurface MEC. LUCs would further mitigate MEC risks to future receptors. Therefore, Alternative 3 would be protective of human health. A safety exclusion zone will be established during mechanical/manual vegetation cutting and MEC removal to further protect the public. The preferred method for vegetation removal in CMC habitat is prescribed burning. The use of mechanical/manual cutting is assumed because the small size of area expected to be addressed in sub-area B-4. Potential impacts to the environment by mechanical/manual cutting will be mitigated to the extent possible and would be managed by habitat monitoring and restoration as needed.

<u>Compliance with ARARs</u> - This alternative would be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 3 for sub-area B-4, the duration of vegetation removal and MEC removal would be approximately five months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks on the surface and in limited areas of the subsurface. The combination of subsurface MEC remediation in selected areas and LUCs would support safe reuse activities (e.g., habitat restoration and prescribed burning) and allow for proper management of the habitat reserve as described in the HMP and additional requirements.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide additional reduction of these parameters through treatment because MEC detected in the subsurface would be removed in selected areas where greater risk reduction would further support reuse.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals in selected areas could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a moderate level of effort to implement from a technical perspective, because subsurface MEC remediation would

involve UXO-qualified personnel teams conducting MEC removals in the subsurface via intrusive investigation of anomalies and managing and reporting MEC-related data. .

In addition, after MEC remediation is completed, LUCs are expected to be easy to implement during reuse to protect human health.

<u>Cost</u> - Alternative 3 for sub-area B-4 is estimated to have a total cost of \$2,397,000. The cost includes \$2,191,000 in capital costs and \$206,000 in annual costs. The cost estimate and assumptions for Alternative 3 for sub-area B-4 is presented in Appendix E, Table E-13.

5.4.1.6.4 Alternative 4: Subsurface MEC Remediation

Assumptions for Alternative 4 in sub-area B-4 include:

- Prescribed burning to remove vegetation because CMC is the main habitat type in subarea B-4;
- Subsurface MEC removal in the entire footprint of the sub-area; and
- Habitat monitoring and restoration, as needed.

<u>Overall Protection of Human Health and the Environment</u> – Surface and subsurface MEC removals (removal depths varied from 1-ft to 4-ft bgs) were conducted in sub-area B-4. It is unlikely that surface MEC remains in sub-area B-4. In portions of B-4, receptors that intrude below the surface potentially could encounter subsurface MEC. Therefore, complete subsurface MEC removal would be protective of human health. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

Under the assumptions for sub-area B-4, vegetation removal would be accomplished by prescribed burning which is the preferred method for vegetation clearance in CMC habitat. The protection of human health during the prescribed burning would be reinforced by conducting the prescribed burning under optimal climatic conditions to minimize smoke and control the burn within its intended boundaries. Advance community notification and smoke management while conducting the burn would minimize potential impacts from smoke. In addition, a safety exclusion zone will be established during prescribed burn operations and MEC removal to further protect the public. Subsurface MEC removals would be conducted in a manner that is compliant with the HMP.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would

be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for sub-area B-4, preparation for the prescribed burn would take approximately four months and the duration of MEC removal following the prescribed burn would be approximately 19 months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in sub-area B-4. All subsurface removals will be to the depth of detection.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment because all detected MEC would be removed.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

<u>Cost</u> - Alternative 4 for sub-area B-4 is estimated to have a total cost of \$10,321,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for sub-area B-4 is presented in Appendix E, Table E-14.

5.4.1.7 Sub-Area B-5

5.4.1.7.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at sub-area B-5.

<u>Overall Protection of Human Health and the Environment</u> - Surface MEC removal and subsurface MEC removals (removal depths varied from 1-ft to 4-ft bgs) were conducted in subarea B-5. It is unlikely that surface MEC remains in sub-area B-5, except in Mudhen Lake. In portions of B-5, receptors that intrude below the surface potentially could encounter subsurface MEC, specifically in MRS-12 or Mudhen Lake. Therefore, NFA would be protective of human health for recreational users who stay on established roads and trails but may not be protective of human health for receptors intruding below the surface or in Mudhen Lake in sub-area B-5.

<u>Compliance with ARARs</u> - No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – Alternative 1 would not be effective in the short term related to potential MEC because no further action would be taken to mitigate MEC risks.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks, because no further action would be taken to mitigate MEC risks to receptors assumed in the RA.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate MEC risks are not expected.

Cost - There are no costs associated with implementation of this alternative for sub-area B-5.

5.4.1.7.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (MEC recognition and safety training, construction support, and public education) on sub-area B-5.

Overall Protection of Human Health and the Environment - Surface and subsurface MEC removals were conducted in sub-area B-5. It is unlikely that surface MEC remains in sub-area B-5, except in Mudhen Lake. In portions of B-5, receptors that intrude below the surface potentially could encounter subsurface MEC, specifically in MRS-12 and Mudhen Lake. Therefore, the site is protective of human health for recreational users who stay on established roads and trails. LUCs would be protective of human health by having MEC recognition and safety training for site workers, construction support for intrusive or ground-disturbing activities, and public education for recreational users. LUC measures would provide a higher confidence of safety for future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - There are no ARARs that apply to implementation of this alternative.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because land use controls (MEC recognition and safety training; construction monitoring; public education) would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because land use controls (MEC recognition and safety training; public education) would be maintained to mitigate potentially remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment; however, potential exposures would be reduced through controls that would mitigate potentially remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage LUCs to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For sub-area B-5, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for sub-area B-5 is \$26,000, which includes \$386 in capital costs and \$25,751 in annual costs. The cost estimate for Alternative 2 for sub-area B-5 is presented in Appendix E, Table E-2.

5.4.1.7.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Surface and subsurface MEC remediation was conducted in sub-area B-5, except in Mudhen Lake. Therefore, Alternative 3 for sub-area B-5 would include site preparation and removal of potential MEC from Mudhen Lake. Alternative 3 would also include limited vegetation removal and subsurface MEC remediation in a limited portion selected to address specific reuse and risk, and determined in coordination with BLM. LUCs would be applied to sub-area B-5 to mitigate any potentially remaining MEC risks.

Overall Protection of Human Health and the Environment - Surface and subsurface MEC removal were conducted in sub-area B-5. In areas where MEC removal has been conducted, it is unlikely that surface MEC remains. MEC removal has not been conducted within Mudhen Lake. In portions of B-5, receptors that intrude below the surface potentially could encounter subsurface MEC, specifically in MRS-12. In Mudhen Lake surface MEC removal would be conducted, and in portions of B-5 subsurface MEC remediation would be conducted in selected areas where receptors that intrude below the surface potentially could encounter MEC. LUCs would further mitigate MEC risks to future receptors. Therefore, Alternative 3 would be protective of human health. Alternative 3 would be implemented in a manner that minimizes impact to the aquatic environment in Mudhen Lake. Alternative 3 for sub-area B-5 would have limited impact to the terrestrial environment.

<u>Compliance with ARARs</u> - This alternative would be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 3 for sub-area B-5, the duration of vegetation removal, dewatering of Mudhen Lake, and MEC removal would be approximately four months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks. The combination of MEC remediation in Mudhen Lake, subsurface MEC remediation in selected areas, and LUCs would support safe reuse activities (e.g., habitat restoration) and allow for proper management of the habitat reserve as described in the HMP and additional requirements.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment if MEC are detected and removed from Mudhen Lake. MEC detected in the subsurface would be removed in selected areas where greater risk reduction would further support reuse.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals in selected areas could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because it would require the dewatering of Mudhen Lake and limited vegetation removal; and involves UXO-qualified personnel teams conducting MEC removals on the surface and in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

In addition, after MEC remediation is completed, Land Use Controls are expected to be easy to implement during reuse to protect human health.

<u>Cost</u> - Alternative 3 for sub-area B-5 is estimated to have a total cost of \$1,849,000. The cost includes \$1,823,000 in capital costs and \$26,000 in annual costs. The cost estimate and assumptions for Alternative 3 for sub-area B-5 is presented in Appendix E, Table E-15.

5.4.1.7.4 Alternative 4: Subsurface MEC Remediation

Assumptions for Alternative 4 in sub-area B-5 include:

- Mechanical/manual cutting to remove vegetation because sub-area B-5 contains a minimum amount of CMC;
- Dewatering of Mudhen Lake;
- Subsurface MEC removal in the entire footprint of the sub-area; and
- Habitat monitoring and restoration, as needed.

Overall Protection of Human Health and the Environment – Surface removal and subsurface MEC removals (removal depths varied from 1-ft to 4-ft bgs) were conducted in sub-area B-5. In areas where MEC removal has been conducted, it is unlikely that surface MEC remains. In portions of B-5, receptors that intrude below the surface potentially could encounter subsurface MEC, specifically in MRS-12. Therefore, complete subsurface MEC removal would be protective of human health. Under the assumptions for sub-area B-5, vegetation would be mechanically cut. In addition, Mudhen Lake would be dewatered and subsurface MEC removals completed within the lake bottom. Potential impacts to the environment from dewatering and subsurface MEC removal will be mitigated to the extent possible and would be managed by habitat monitoring and restoration as needed.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing public safety exclusion zones, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for sub-area B-5, the duration of vegetation removal, dewatering of Mudhen Lake, and MEC removal would be approximately nine months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in sub-area B-5. All subsurface removals will be to the depth of detection.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment if MEC are present and removed. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals could

be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance and dewatering of Mudhen Lake prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

<u>Cost</u> - Alternative 4 for sub-area B-5 is estimated to have a total cost of \$3,134,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for sub-area B-5 is presented in Appendix E, Table E-16.

5.4.1.8 Sub-Area B-6

5.4.1.8.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at sub-area B-6.

<u>Overall Protection of Human Health and the Environment</u> - Surface and subsurface MEC removals were conducted over the majority of sub-area B-6. It is unlikely that surface or subsurface MEC remains in sub-area B-6; however, areas not previously addressed due to the terrain may contain MEC. In addition, MEC detection technologies are not considered to be 100 percent effective. Therefore, NFA would be protective of human health for recreational users who stay on established roads and trails but may not be protective of human health for workers who intrude below the surface off of the roads and trails in sub-area B-6.

<u>Compliance with ARARs</u> - No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – This action would not be effective in the short term related to potential MEC because no further action would be taken to mitigate MEC risks.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks. MEC removals have been conducted over the majority of the sub-area; however, portions of sub-area B-6 may contain MEC.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative would not be administratively feasible to

implement because the necessary approvals to take no further action to mitigate potential remaining MEC risks are not expected.

<u>Cost</u> - There are no costs associated with implementation of this alternative for sub-area B-6.

5.4.1.8.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (MEC recognition and safety training, construction support, and public education) on sub-area B-6.

Overall Protection of Human Health and the Environment - Surface and subsurface MEC removals were conducted in sub-area B-6. It is unlikely that surface or subsurface MEC remains in sub-area B-6; however, areas not previously addressed due to the terrain may contain MEC. In addition, MEC detection technologies are not considered to be 100 percent effective. Therefore, LUCs would be protective of human health by having MEC recognition and safety training for site workers, construction support for ground-disturbing or intrusive activities, and public education for recreational users. LUC measures would provide a higher confidence of safety for future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - There are no ARARs that apply to implementation of this alternative.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because LUCs would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because LUCs would be maintained to mitigate potentially remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment; however, potential exposures would be reduced through controls that would mitigate potentially remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage Land Use Controls to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For sub-area B-6, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for sub-area B-6 is \$61,000, which includes \$899 capital costs and \$59,907 in annual costs. The cost estimate for Alternative 2 for sub-area B-6 is presented in Appendix E, Table E-2.

5.4.1.8.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Alternative 3 is not applicable for sub-area B-6. Surface and subsurface MEC removals were conducted in accessible portions of sub-area B-6.

5.4.1.8.4 Alternative 4: Subsurface MEC Remediation

Assumptions for Alternative 4 in sub-area B-6 include:

- Mechanical/manual cutting to remove vegetation because sub-area B-6 contains limited CMC vegetation;
- Subsurface MEC removal in the entire footprint of the sub-area; and
- Habitat monitoring and restoration, as needed.

Overall Protection of Human Health and the Environment – Surface and subsurface MEC removals were conducted in sub-area B-6. It is unlikely that surface or subsurface MEC remains in sub-area B-6; however, areas not previously addressed due to the terrain may contain MEC. In addition, MEC detection technologies are not considered to be 100 percent effective Therefore, complete subsurface MEC removal could provide additional protection. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action. Under the assumptions for sub-area B-6, vegetation would be mechanically cut. Any MEC removals conducted would be performed in a manner that is compliant with the HMP.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for sub-area B-6, vegetation removal would take approximately two months and the duration of MEC removal would be approximately six months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in sub-area B-6. All subsurface removals will be to the depth of detection.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide minimal reduction of these parameters through treatment because the majority of sub-area B-6 previously had surface and subsurface removal. Alternative 4 would result in reduction if MEC are present and removed from sub-area B-6. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement technology-aided surface and subsurface MEC removals could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because (1) it would require vegetation clearance prior to implementation of MEC removal, and (2) involves UXO-qualified personnel teams conducting MEC removals in the subsurface via intrusive investigation of anomalies, and managing and reporting MEC-related data.

<u>Cost</u> - Alternative 4 for sub-area B-6 is estimated to have a total cost of \$2,527,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for sub-area B-6 is presented in Appendix E, Table E-17.

5.4.1.9 MRS-16

5.4.1.9.1 Alternative 1: No Further Action

Alternative 1 would perform no further action to address MEC risks at MRS-16.

<u>Overall Protection of Human Health and the Environment</u> - Surface and subsurface MEC removals were conducted in MRS-16. It is unlikely that surface or subsurface MEC remains in MRS-16, except for in the "saturated area." Therefore, NFA would be protective of human health for the majority of MRS-16. NFA may not be protective of human health in the "saturated area" of MRS-16.

Compliance with ARARs - No ARARs were identified for taking no further action.

<u>Short-Term Effectiveness</u> – This alternative may be effective in the short term related to potential MEC because all detected MEC items have been removed from the site.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would not provide long-term effectiveness or permanence regarding mitigation of MEC risks in the "saturated area," because no further action would be taken to mitigate MEC risks to receptors assumed in the RA.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment because no further action would be taken to reduce the amount of potential MEC.

<u>Implementability</u> - This alternative would be technically easy to implement because no additional remedial activity is required. However, this alternative may not be administratively feasible to implement because the necessary approvals to take no further action to mitigate MEC risks are not expected.

Cost - There are no costs associated with implementation of this alternative for MRS-16.

5.4.1.9.2 Alternative 2: Land Use Controls

Alternative 2 would place land use controls (MEC recognition and safety training, construction support, and public education) on MRS-16.

<u>Overall Protection of Human Health and the Environment</u> - Surface and subsurface MEC removals were conducted in MRS-16. It is unlikely that surface or subsurface MEC remains in MRS-16, except for in the "saturated area." Therefore, LUCs would be protective of human health. LUC measures would provide a higher confidence of safety for future land users to conduct activities required by HMP; therefore, the environment will not be adversely affected by Alternative 2.

<u>Compliance with ARARs</u> - There are no ARARs that apply to implementation of this alternative.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term because LUCs would be implemented to mitigate MEC risks to receptors.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence because LUCs would be maintained to mitigate potentially remaining MEC risks.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would not provide reduction of these parameters through treatment; however, potential exposures would be reduced through controls that would mitigate potentially remaining MEC risks to receptors.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement and manage LUCs to reduce MEC risks for planned reuse could be obtained.

<u>Cost</u> - LUCs for BLM Area B and MRS-16, without additional MEC removal, are assumed to have a total cost of \$1,015,000. For MRS-16, the total cost has been apportioned to the percent of the total acreage for BLM Area B and MRS-16. The cost of LUCs for MRS-16 is \$49,000,

which includes \$724 in capital costs and \$48,283 in annual costs. The cost estimate for Alternative 2 for MRS-16 is presented in Appendix E, Table E-2.

5.4.1.9.3 Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Alternative 3 is not applicable for MRS-16. Technology-aided surface and complete subsurface MEC removals were conducted in the majority of MRS-16. Surface MEC removal was conducted in the "saturated area."

5.4.1.9.4 Alternative 4: Subsurface MEC Remediation

Assumptions for Alternative 4 for MRS-16 would include:

- Mechanical/manual cutting to remove vegetation from the "saturated area;"
- Excavation and sifting to depth of detection in the "saturated area;"
- Post-excavation DGM and subsurface MEC removal from the bottom of the excavated area;
- Placement of sifted soil into the excavated area; and
- Habitat monitoring and restoration, as needed.

<u>Overall Protection of Human Health and the Environment</u> – Surface and subsurface MEC removals were conducted in MRS-16. It is unlikely that surface or subsurface MEC remains in MRS-16, except for in the "saturated area." Therefore, complete subsurface MEC removal in the "saturated area" would be protective of human health. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action. The excavation would be performed in a manner that complies with the HMP. Habitat restoration would be accomplished to reestablish the CMC habitat.

<u>Compliance with ARARs</u> - This alternative could be implemented in compliance with the potential ARARs listed in Table 5-1. Excavation and sifting in the "saturated area" could be implemented in a manner that complies with the HMP and additional requirements.

<u>Short-Term Effectiveness</u> - This alternative would be effective in the short term. Public exposures to MEC during the implementation of vegetation clearance, excavation, and MEC removal would be prevented by establishing a safety exclusion zone, which could include temporary fencing and security patrols. Workers conducting vegetation clearance, excavation, and MEC removal would conduct work in a safe manner according to a health and safety plan. Based on the assumptions used to determine the cost of Alternative 4 for MRS-16, the duration

of vegetation removal, excavation of the "saturated area," and MEC removal following the excavation would be approximately three months.

<u>Long-Term Effectiveness and Permanence</u> - This alternative would provide long-term effectiveness and permanence regarding mitigation of MEC risks in MRS-16. After excavation of the "saturated area" was completed, subsurface MEC removal would be conducted at the bottom of the excavation. All subsurface removals will be to the depth of detection. Sifted soil will be placed back into the excavated area habitat restoration would be performed.

<u>Reduction of Toxicity, Mobility, or Volume through Treatment</u> - This alternative would provide reduction of these parameters through treatment if MEC are present and removed. At a minimum, uncertainty about potential presence of MEC will be reduced if no MEC is found through conducting the removal action.

<u>Implementability</u> - This alternative would be administratively feasible to implement, because the necessary approvals to implement excavation and sifting could be obtained. The necessary services, equipment, and skilled workers to implement this alternative are readily available. This alternative would require a high level of effort to implement from a technical perspective, because it involves a UXO-qualified personnel team conducting excavation and sifting of soil potentially containing MEC, and managing and reporting MEC-related data. Excavation and sifting would be conducted in a manner that complies with the HMP and in accordance with health and safety plans. Habitat restoration and monitoring would be required following the placement of sifted soil back into the excavation.

<u>Cost</u> - Alternative 4 for MRS-16 is estimated to have a total cost of \$817,000, with only capital costs. The cost estimate and assumptions for Alternative 4 for MRS-16 is presented in Appendix E, Table E-18.

5.4.2 Modifying Criteria

5.4.2.1 State Acceptance

State acceptance will be addressed in the resulting ROD once comments on the RI/FS report and Proposed Plan have been received. Anticipated acceptability of the remedial alternatives based on comments received on draft RI/FS are described below.

Alternative 1, No Further Action, is not likely to be acceptable to the regulatory agencies because it does not take action to mitigate potentially remaining MEC risks.

Alternative 2, Land Use Controls, is anticipated to be acceptable to the regulatory agencies because it takes action both in the short and long term to mitigate potentially remaining MEC

risks to surface and subsurface receptors, and provides protection of human health and the environment.

Alternative 3, Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls, is anticipated to be acceptable to the regulatory agencies because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

Alternative 3, Subsurface MEC Remediation, is anticipated to be acceptable to the regulatory agencies because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

5.4.2.2 Community Acceptance

Community acceptance will be addressed in the resulting ROD once comments on the RI/FS report and Proposed Plan have been received. Anticipated acceptability of the remedial alternatives based on comments received on draft RI/FS are described below.

Alternative 1, No Further Action, is not likely to be acceptable to the community because it does not take action to mitigate potentially remaining MEC risks.

Alternative 2, Land Use Controls, may be acceptable to the community because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

Alternative 3, Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls, may be acceptable to the community because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

Alternative 4, Subsurface MEC Remediation, may be acceptable to the community because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

5.5 Comparison of Remedial Alternatives

5.5.1 Overall Protection of Human Health and the Environment

Alternative 1 would not be protective of human health in sub-areas without previous MEC removals because it takes no further action to address MEC risks posed to the receptors assumed

in the RA. Alternative 2 would be protective of human health by lowering potential receptor risk by implementing and maintaining LUCs.

In sub-areas B-1, B-2, B-2A, B-3, and B-3A, Alternative 3 would be protective of human health by removing potential surface MEC and subsurface MEC in select areas, in combination with LUCs. Alternative 3 would have a positive effect on the environment for sub-areas where prescribed burn is conducted. In sub-areas B-4 and B-5, Alternative 3 would be protective of human health if MEC remain in select areas of the subsurface or within Mudhen Lake. Alternative 3 is not applicable for sub-area B-6 or MRS-16.

Alternative 4 would provide the greatest level of protection for human health because it would remove MEC on the surface and the subsurface, thereby mitigating MEC risks to receptors to the greatest degree.

5.5.2 Compliance with ARARs

Alternatives 1 and 2 do not have ARARs. Alternatives 3 and 4 would be implemented in compliance with potential ARARs listed in Table 5-1.

5.5.3 Short-Term Effectiveness

Alternative 1 would not be effective in the short term because no further action would be taken to mitigate MEC risks.

Alternative 2 would be effective in the short term regarding mitigation of MEC risks by implementing LUCs for all sub-areas and MRS-16.

Alternatives 3 and 4 would be effective in the short term regarding mitigation of MEC risks. Workers and the community would be protected during implementation of vegetation removal and MEC removal. Alternative 3 would include LUCs to further protect the public and site workers from potentially remaining MEC risks. Alternative 4 would remove potentially remaining MEC risks.

5.5.4 Long-Term Effectiveness and Permanence

Alternative 1 would not provide long-term effectiveness or permanence because no further action would be taken to mitigate MEC risks. Alternatives 2 and 3 would provide long-term effectiveness and permanence during reuse because land use controls would be implemented to mitigate potentially remaining MEC risks. Alternative 4 would provide long-term effectiveness and permanence during reuse because potentially remaining MEC would be removed.

For sub-areas B-1, B-2, B-2A, B-3, B-3A, B-4, and B-5, Alternative 3 would provide a greater degree of protection because surface MEC and subsurface MEC in select areas at the site would be removed, thereby reducing the potential for exposures. Alternative 3 would include LUCs to

further protect the public and site workers from potential exposures in the future. Alternative 3 is not applicable for sub-area B-6 and MRS-16.

Alternative 4 would provide the greatest degree of long-term effectiveness and permanence for all sub-areas and MRS-16 because it would remove MEC detected both on the surface and in the subsurface, providing the greatest risk reduction and facilitating reuse of the area as a habitat reserve.

5.5.5 Reduction of Toxicity, Mobility, or Volume through Treatment

Alternatives 1 and 2 would not provide reduction of these parameters through treatment because no action would be taken to remove MEC.

Alternatives 3 and 4 would provide varying degrees of reduction of these parameters through removal of MEC. For sub-areas B-1, B-2, B-2A, B-3, and B-3A, under Alternative 3, surface MEC would be removed and subsurface MEC would be removed from within selected areas (approximately 10 percent). For sub-area B-4, Alternative 3 would remove subsurface MEC in select portions of the sub-area. For sub-area B-5, Alternative 3 would remove MEC from the bottom of Mudhen Lake, if present, and would remove subsurface MEC from select portions of the sub-area. Alternative 3 is not applicable for sub-area B-6 and MRS-16.

Under Alternative 4, MEC would be removed from the entire area. For sub-area B-1, B-2, B-2A, B-3, and B-3A, Alternative 4 would remove any surface or subsurface MEC. For sub-areas B-4 and B-6, Alternative 4 would remove any subsurface MEC remaining after the previously completed removals. For sub-area B-5, Alternative 4 would include removal of MEC from the bottom and subsurface of Mudhen Lake, if present, and remove any remaining subsurface MEC. Alternative 4 for MRS-16 would excavate the "saturated area" and remove any remaining MEC from the subsurface of the excavation.

5.5.6 Implementability

Alternative 1 would not be administratively feasible to implement because the necessary approvals to take no further action to mitigate the MEC risks are not expected.

Alternative 2 would be administratively feasible to implement because the necessary approvals for LUCs could be obtained.

Alternatives 3 and 4 would both be implementable from an administrative perspective, because the necessary approvals to implement MEC removals to reduce MEC risks for planned reuses could be obtained. The necessary services, equipment, and skilled workers to implement these alternatives are also readily available. Where used, DGM may be limited in implementability

because of terrain and issues with tree cover. Alternative 4 would require a higher level of effort to implement from a technical perspective, because it involves full subsurface investigation.

5.5.7 *Cost*

Table 5-3 summarizes the estimated costs associated with implementation of the four remedial alternatives. The No Further Action Alternative has no costs associated with its implementation. Of the three MEC remediation alternatives, Alternative 2 has the lowest total estimated cost associated with its implementation for each sub-area of BLM Area B and MRS-16. Alternative 3 has a total estimated cost associated with implementation which is in between the total estimated costs for implementation of Alternatives 2 and 4. Alternative 4 has the highest total estimated cost associated with its implementation. Cost estimates for these alternatives, and Long Term Management Measure costs of \$410,000, for BLM Area B and MRS-16 are provided in Appendix E. Costs for Alternatives 2 through 4 presented in Tables E-2 through E-18.

5.5.8 State Acceptance

State acceptance will be addressed in the resulting ROD once comments on the RI/FS Report and Proposed Plan have been received.

Alternative 1 is not likely to be acceptable to the regulatory agencies because it does not take action to mitigate potentially remaining MEC risks. Alternatives 2, 3, and 4 are anticipated to be acceptable to the regulatory agencies because they take varying degrees of action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

5.5.9 Community Acceptance

Community acceptance will be addressed in the resulting ROD once comments on the RI/FS report and Proposed Plan have been received.

Alternative 1 is not likely to be acceptable to the community because it does not take action to mitigate potentially remaining MEC risks. Alternatives 2, 3, and 4 may be acceptable to the community because they each take action to a varying degree both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

5.6 Identification of Preferred Remedial Alternative

This section identifies the preferred remedial alternatives that best meet the evaluation criteria for MEC remediation of each sub-area of BLM Area B and MRS-16. Long Term Management Measures (i.e., property transfer documentation, annual monitoring, and five-year review reporting) associated with the implementation and management of the selected remedies for

BLM Area B and MRS-16 are estimated to have a total cost over a period of 30 years of approximately \$410,000. Cost estimates for these measures are provided in Appendix E, Table E-1.

The four remedial alternatives evaluated and compared in Section 5.0 based on the nine CERCLA evaluation criteria specified in the EPA's RI/FS Guidance (*EPA*, 1989) for BLM Area B are:

- Alternative 1: No Further Action
- Alternative 2: Land Use Controls
- Alternative 3: Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls
- Alternative 4: Subsurface MEC Remediation

Based on the evaluation and comparison of the four remedial alternatives, the following alternatives are identified as preferred remedial alternatives.

5.6.1 Alternative 2, Land Use Controls

Alternative 2, Land Use Controls, is identified as the preferred remedial alternative for BLM Area B sub-areas B-1, B-2, B-3A, B-4, B-5, B-6, and MRS-16.

Under this alternative, safety measures would be incorporated into reuse activities such as recreational use, firefighting, and outdoor maintenance or roadwork activities. As described in Section 5.3.3, this alternative includes MEC recognition and safety training, construction support during reuse activities, and public education.

If selected for implementation, these measures would be described in further detail in a LUCI RD/RAWP. At the time of each five-year review, the Army or Army's representatives would assess the status of the measures and document any recommendations or modifications to the program as described in the LUCI RD/RAWP.

5.6.1.1 Threshold Criteria

- (1) Overall Protection of Human Health and the Environment Alternative 2 controls potential threats to public health through institutional controls (LUCs). The natural resources found on the site would not be impacted during the implementation of this alternative.
- (2) Compliance with ARARs No ARARs were identified that apply to implementation of Alternative 2.

5.6.1.2 Balancing Criteria

- (3) Long-Term Effectiveness and Permanence —Alternative 2 would provide long-term effectiveness and permanence for planned reuses of the site and maintain protection of human health and the environment over time with LUCs.
- (4) Reduction of Toxicity, Mobility, or Volume through Treatment Alternative 2 would provide no reduction of the toxicity, mobility, and volume of MEC through treatment. However, MEC removals have been conducted in some of the subareas, and LUCs would support safe reuse through MEC recognition and safety training, construction support during reuse, and public education.
- (5) Short-Term Effectiveness Alternative 2 would be effective in the short term by having LUCs applied.
- (6) Implementability Alternative 2 would be administratively feasible to implement, and the necessary approvals for its implementation are assumed to be easily obtained.
- (7) Cost Total costs estimated for implementation of Alternative 2 are approximately \$536,000 for the six sub-areas and MRS-16. Alternative 2 for sub-area B-1 cost approximately \$67,000, sub-area B-2 costs approximately \$86,000, sub-area B-3A costs approximately \$38,000, sub-area B-4 costs approximately \$209,000, sub-area B-5 costs approximately \$26,000, sub-area B-6 costs approximately \$61,000, and MRS-16 costs approximately \$49,000.

5.6.1.3 Modifying Criteria

- (8) State Acceptance State Acceptance will be addressed in the resulting ROD once comments on the RI/FS report and Proposed Plan have been received (EPA, 1989). Alternative 2 is anticipated to be acceptable to the regulatory agencies because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.
- (9) Community Acceptance Community Acceptance will be addressed in the resulting ROD once comments on the RI/FS report and Proposed Plan have been received (EPA, 1989). Alternative 2 is anticipated to be acceptable to the community because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

5.6.2 Alternative 3, Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls

Alternative 3, Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas, and Land Use Controls, is identified as the preferred remedial alternative for BLM Area B sub-areas B-2A and B-3.

This alternative includes technology-aided surface MEC remediation, and subsurface MEC remediation in selected areas to address specific concerns regarding MEC risk or reuse needs, such as proposed roads, fuel breaks, trails, and habitat restoration sites.

For sub-area B-3, it is assumed that vegetation removal would be conducted using prescribed burning of CMC habitat for a majority of the area where burn containment lines can be established. Manual and mechanical vegetation removal would be used for the remainder of the area where burn containment would be more difficult. For sub-area B-2A, vegetation removal would be conducted using manual and mechanical means because the small size of sub-area B-2A and the lack of existing fire roads at the perimeter make it difficult to conduct a successful prescribed burn. The technology-aided surface MEC remediation and subsurface MEC remediation in selected areas alternative would include the following components:

- Vegetation removal by cutting and prescribed burning to provide access to conduct MEC removals.
- Technology-aided surface MEC removal, and detonation with engineering controls of any UXO identified; MEC detection instruments would be available onsite for investigation and removal of any MEC present in areas where the ground surface is not visible.
- Digital mapping would be implemented to provide a record of remaining anomalies in surface removal areas. The digital map can be used by the future landowners to assist in land management decision-making.
- Subsurface MEC removal (intrusive investigation of anomalies) in selected areas where greater risk reduction would further support the reuse (such as proposed habitat restoration areas or road and trail development). For the purposes of this FS, it is assumed that subsurface MEC removal will be conducted in approximately 10 percent of sub-areas B-2A and B-3. Subsurface MEC removal areas would be identified in coordination with the agencies and BLM based on factors such as the feasibility of implementation, cost, and habitat management requirements.

- Implementation of Land Use Controls (MEC recognition and safety training, construction support, and public education.)
- Post-remediation habitat monitoring.

5.6.2.1 Threshold Criteria

- (1) Overall Protection of Human Health and the Environment Alternative 3 eliminates, reduces, or controls potential threats to public health through treatment (MEC removal) and institutional controls (LUCs), offering the benefits of a complete surface MEC removal throughout sub-areas B-2A and B-3, as well as subsurface MEC removal in selected areas where greater risk reduction would further support the reuse. This alternative would be protective of human health and the environment in conjunction with LUCs. Impacts to the natural resources found on the site would be minimized during the implementation of this alternative. Subsurface MEC removal would be implemented in selected areas (approximately 10 percent) of the sub-areas B-2A and B-3 where greater risk reduction would further facilitate reuse of the area as a habitat reserve. This alternative would provide protection of the environment, because vegetation removal and MEC removal would be performed in a manner that is consistent with HMP. In addition, post-remediation habitat monitoring would be conducted in accordance with HMP requirements to monitor the recovery of the habitat after MEC remedial actions are implemented.
- (2) Compliance with ARARs Alternative 3 would be conducted in a manner that complies with the potential ARARs identified in Table 5-1 that pertain to the remedial actions and site-specific conditions within sub-areas B-2A and B-3.

5.6.2.2 Balancing Criteria

- (3) Long-Term Effectiveness and Permanence —Alternative 3 would provide long-term effectiveness and permanence for planned reuses of the site and maintain protection of human health and the environment over time with LUCs.
- (4) Reduction of Toxicity, Mobility, or Volume through Treatment Alternative 3 would provide reduction of the toxicity, mobility, and volume of MEC through treatment (for which there is a statutory preference) to reduce the harmful effects of principal contaminants (MEC) on the surface and in selected areas in the subsurface that support safe reuse.
- (5) Short-Term Effectiveness Alternative 3 would require a moderate length of time and level of effort to implement, and would be implemented in a manner that is safe for the workers and the public.

- (6) Implementability Alternative 3 would be administratively feasible to implement, and the necessary approvals for its implementation are assumed to be easily obtained. This alternative also would be technically feasible to implement as the services, necessary equipment, and skilled workers to implement this alternative are readily available. Conducting DGM can be difficult to implement where terrain and/or tree cover limit data collection.
- (7) Cost Total costs estimated for implementation of Alternative 3 are approximately \$23,630,000, with sub-area B-2A costing approximately \$1,708,000 and sub-area B-3 costing approximately \$21,922,000.

5.6.2.3 Modifying Criteria

- (8) State Acceptance State Acceptance will be addressed in the resulting ROD once comments on the RI/FS report and Proposed Plan have been received (EPA, 1989). Alternative 3 is anticipated to be acceptable to the regulatory agencies because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.
- (9) Community Acceptance Community Acceptance will be addressed in the resulting ROD once comments on the RI/FS report and Proposed Plan have been received (EPA, 1989). Alternative 3 is anticipated to be acceptable to the community because it takes action both in the short and long term to mitigate potentially remaining MEC risks to surface and subsurface receptors, and provides protection of human health and the environment.

6.0 APPROVAL PROCESS

This section summarizes the proposed process for approval of the RI/FS including the following elements:

- Prepare the RI/FS report with regulatory agency and public review of the Draft and Draft Final reports.
- Prepare a Proposed Plan that presents the Army's preferred alternative for the site and summarizes the results of the RI, RA, and FS.
- Solicit for public comments on the Proposed Plan during a 30-day public comment period. Provide an opportunity for a public meeting on the Proposed Plan where written and verbal comments can be submitted.
- Prepare the ROD that (1) summarizes the results of the RI, RA, and FS, (2) includes a Responsiveness Summary that summarizes any public comments received on the Proposed Plan during the public comment period, and Army responses to comments, and (3) specifies the details of the selected remedy(s), including plans for development and submittal of a Remedial Design/Remedial Action Work Plan (RD/RAWP).
- Receive EPA approval of the ROD, and review by DTSC.
- Publish a newspaper notice of the signed ROD.

Table	e 3-2	MEC Pos	t Remedial Action Risk Analysis for MRS-16
Areas w	here	Surface a	and Subsurface MEC Removals were completed
MRSs	MRS-		
Proposed Reuse		at/Recreation	
Analysis		Remedial Acti	on
Receptor Type	Recre	eational User	MEC items are not accessible because a removal to death was consisted
		Accessibility Factor 1	MEC items are not accessible because a removal to depth was completed and all detected MEC items were removed, the work was completed according to a BCT approved work plan, and the recreational user is not expected to intrude below the surface. The area is on flat to gently sloping terrain and is not expected to be significantly affected by erosion.
MEC Risk Score	"A"	Exposure Factor 1	The Frequency of Entry for a recreational user is frequent and the Intensity of Contact with Soil is moderate: however, a removal to depth was completed and all detected MEC items were removed. The work was completed according to the BCT approved work plan; therefore, the potential for Exposure is low.
		MEC Type 3	Type 3 items recovered include a 37mm projectile, an anti-tank rifle grenade, and 2.36-inch antitank rockets. Some Type 1 items include a missile stimulant, 35mm sub caliber practice rocket, smoke rifle grenade, and surface trip flares. All items at Fort Ord are assumed to be fuzed (if not inert) and portable.
Receptor Type	Outdo	or Maintenan	nce/Fire Fighter/ Prescribed Burn Worker
	"A"	Accessibility Factor a	MEC items are not accessible because a removal to depth was completed and all detected MEC items were removed, the work was completed according to a BCT approved work plan. The outdoor maintenance / fire fighter/ prescribed burn worker is expected to conduct significant intrusion below the surface. The area is on flat to gently sloping terrain and is not expected to be significantly affected by erosion.
MEC Risk Score		Exposure Factor 1	The Frequency of Entry for an outdoor maintenance/fire fighter/ prescribed burn worker is frequent and the Intensity of Contact with Soil is high: however, a removal to depth was completed and all detected MEC items were removed. The work was completed according to the BCT approved work plan; therefore, the potential for Exposure is low.
		MEC Type 3	Type 3 items recovered include a 37mm projectile, an anti-tank rifle grenade, and 2.36-inch antitank rockets. Some Type 1 items include a missile stimulant, 35mm sub caliber practice rocket, smoke rifle grenade, and surface trip flares. All items at Fort Ord are assumed to be fuzed (if not inert) and portable.
Receptor Type	Cons	truction Work	er
		Accessibility Factor 1	MEC items are not accessible because a removal to depth was completed and all detected MEC items were removed, the work was completed according to a BCT approved work plan. The construction worker is expected to conduct significant intrusion below the surface. The area is on flat to gently sloping terrain and is not expected to be significantly affected by erosion.
MEC Risk Score	"A"	Exposure Factor 1	The Frequency of Entry for a construction worker is frequent and the Intensity of Contact with Soil is high: however, a removal to depth was completed and all detected MEC items were removed. The work was completed according to the BCT approved work plan; therefore, the potential for Exposure is low.
		MEC Type 3	Type 3 items recovered include a 37mm projectile, an anti-tank rifle grenade, and 2.36-inch antitank rockets. Some Type 1 items include a missile stimulant, 35mm sub caliber practice rocket, smoke rifle grenade, and surface trip flares. All items at Fort Ord are assumed to be fuzed (if not inert) and portable.
	Data (Quality	The data used was collected according to the BCT approved work plan and is considered usable for performing the risk assessment.

Tæ 201Í Page 1 of 1

Table 4-1 Description of Receptors Evaluated in the BLM Area B and MRS-16 RI/FS										
Receptor	Description	Level of Intrusion	Frequency of Entry	Intensity of Contact with Soil						
Recreational User	Expected recreational uses of the property include non-motorized uses such as walking or horseback riding on established paths and bicycling on established paths and roads.	A recreational user is not expected to intrude below the surface.	A recreational receptor is expected to enter the area frequently.	A recreational user is expected to spend up to 6 hours per day in contact with the soil (moderate intensity of contact).						
Firefighter	Firefighters are expected to implement controlled burns, perform activities associated with building fuel breaks and respond to wildfires. In general, firefighting can be conducted as a surface-only activity. In emergency situations, subsurface intrusion could be used to protect the public.	A firefighter is not expected to intrude below the surface unless in an emergency when the level of intrusion could be up to a depth of 3 feet.	A firefighter is expected to enter the area occasionally.	A firefighter is expected to spend 8 hours per day in contact with the soil (high intensity of contact).						
Outdoor Maintenance Worker	An outdoor maintenance worker is assumed to be responsible for landscape and gardening activities and trail maintenance in the area.	An outdoor maintenance worker is expected to intrude below the surface up to a depth of 3 feet.	An outdoor maintenance worker is expected to enter the area frequently.	An outdoor maintenance worker is expected to spend up to 8 hours per day in contact with the soil (high intensity of contact).						
Construction Worker	Construction workers are expected to perform earth moving associated with trail and road construction using power equipment. (No structures are expected to be built; therefore, no excavations associated with building foundations or utilities will be needed.)	A construction worker is expected to intrude below the surface up to a depth of 5 feet.	A construction worker is expected to enter the area frequently.	A construction worker is expected to spend 8 hours per day in contact with the soil (high intensity of contact).

Table	Table 4-2 Depth Below Ground Surface							
Score	Description (a)(b)(c)(d)							
1	100% of detected MEC was removed considering the data quality for the site.							
2	MEC > 5 feet bgs							
3	MEC > 4 feet bgs							
4	MEC ≥ 3 feet bgs							
5	MEC ≥ 2 feet bgs							
6	MEC > 1 feet bgs							
7	No MEC on the surface and MEC below surface							
8	Any MEC on surface							
Notes:								

- (a) The shallowest MEC item found determines the depth below ground surface for the area.
- (b) If significant uncertainty exists about the depth of the MEC item, it may be appropriate to assign the next highest score.
- Depth should be based on actual field measurements of MEC items found.
- Detection and removal procedures meeting the DQOs for the sector based on clearly defined investigational objectives including reuse and the detection of designated MEC. If DQOs have not been established for the sector, the quality of data should be approved by the BCT to score a "1".

Table 4-3 Depth Below Ground Surface Based on Current Conditions									
	Depth	of MEC Found (in	nches)	Depth Below Ground Surface Score					
	ľ	MEC Hazard Type	9	М	EC Hazard Type				
Sub-area	1	2	3	1	2	3			
B-1		0	-	NS (a)	NS	NS			
B-2	0-8	1		8	7				
B-2A	0-5	0	0	8	8	8			
B-3	0-18	0-27	1-18	NS	NS	NS			
B-3A	-	1	-	NS	NS	NS			
B-4	0-30	0-13	0-13	8	8	8			
B-5	0-18	0-6	0-6	7	7	7			
B-6			1	8	8	8			

Notes:

NS = Not scored. As described in Section 4, depth scores for sub-areas B-1, B-3, and B-3A were not evaluated because of the limited information available.

Table	Table 4-4 Level of Intrusion								
Score	Description (a)(b)								
1	Non-Intrusive: Activity on the ground surface, none below the surface.								
2	Minor Intrusions: Activity on ground surface and ground disturbances to a depth of one foot bgs.								
3	Moderate Intrusions: Ground disturbances to a depth of two feet bgs.								
4	Significant Intrusions: Ground disturbances to a depth of four feet bgs.								
5	Highly Intrusive: Ground disturbances greater than four feet bgs.								
Notes:									
(a)	The deepest intrusion level expected for a given reuse determines the Level of Intrusion for activities for the sector.								
(b)	If significant uncertainty exists about the depth of intrusion, it may be appropriate to assign the next highest score.								

Ma²⁰¹⁵ Page 1 of 1

Table	Table 4-5 Migration/Erosion Potential								
Score	Description (a)								
1	Very Stable: MEC will not migrate. Annual erosion is equal to or less than the site-wide average of 3/100 inch.								
2	Minor Migration: Recurring and extreme natural events may cause MEC to migrate upward, potentially reaching the intrusion level, over a period of time (more than two five-year reviews). Annual erosion is greater than the average site-wide condition but less than one inch (b) .								
3	Significant Migration: Recurring and extreme natural events will bring MEC to the surface within the first recurring review. Annual erosion is more than one inch (c).								
Notes:									
(a)	The Migration/Erosion factor should consider the potential for changes in the depth of MEC due to erosion. The presence of human activities, streams, gullies, or steep slopes in an area may require a more thorough investigation of the potential for erosion.								
(b)	Average annual site-wide erosion potential is 3/100 inch.								
(c)	Significant erosion at Fort Ord is likely limited to areas disturbed by human activity, such as roads or firebreaks.								

		Mi	gration/Erosio	n Potential

B-6	100.5	89	89%	44087	6	3	496.7	0.09	0.05	4	2	2	

Notes:

- (a) The MEC Densities for surface intruders are based on all MEC items found on the surface during sampling or removal activities. Densities were calculated using UXO Estimator to determine an upper-bound MEC density.
- For some areas, acreage sampled included data from various technology aided site walks. Acreages of total area from site walks are calculated based on the length of the walk and an assumed path width of 5ft. BLM restored 12 acres within sub-area B-2 in 2011 and 2012. Although not a sampling investigation, intrusive activities were performed and no munitions items were reported during the work.
- NS = Not scored. As described in Section 4, depth scores for sub-areas B-1, B-3, and B-3A were not evaluated because of the limited information available. In sub-area B-2, no MEC Hazard Type 2 or 3 were found on the surface.

Page 1 of 1 Ma²⁰¹⁵

	Table 4-13 MEC Hazard Classification						
Score	Description (a)						
0	Inert MEC; will cause no injury (b)						
1	MEC that will cause an injury, or in extreme cases could cause major injury or death to an individual if functioned by an individual's activities (c)						
2	MEC that will cause major injury, or in extreme cases could cause death to an individual if functioned by an individual's activities (d)						
3	MEC that will kill an individual if detonated by an individual's activities						
Notes: (a) (b) (c) (d)	MEC type must only be determined by UXO-trained personnel. Inert describes the condition of a munition or component that contains no explosive, pyrotechnic, or chemical agent. An injury is defined as a flesh wound or minor burn. A major injury is defined as the loss of sight, hearing or limbs, or major burn.						

Table 4-14 Overall MEC Risk Scoring Matrix (a)									
				Exposure					
MEC Type	Accessibility	1. Least Potential for Exposure	2. Not Likely to be Exposed	3. May be Exposed	4. Likely to be Exposed	5. Greatest Potential for Exposure			
0. Inert MEC	Least potential for Accessibility	Α	А	А	Α	Α

Tabl	Table 4-16.1 MEC Baseline Risk Analysis for Sub-area B-2						
MRSs	MRS.	MRS-10B (Southern portion)					
Proposed Reuse		Habitat/Recreational					
Analysis	Base	line					
Receptor Type	Surfa	Surface Receptor (not expected to intrude below the surface)					
		Accessibility Factor 5	An accessibility factor a score of 5 (Greatest Potential for Accessibility) was calculated for a surface receptor for MEC hazard type 1 items on the surface. Because only a portion of the area has been investigated, there is a potential that similar MEC items could remain at the surface. No MEC hazard type 3 items have been found in sub-area B-2 and no MEC hazard type 2 items were found on the surface.				
MEC Risk Score	"D"	Exposure Factor 4	The Frequency of Entry for a surface receptor is frequent and the Intensity of Contact with soil is moderate. A MEC density input score of 3 (medium) was used for hazard type 1. A MEC density input score was not used for hazard type 3 as none were found and not used for hazard type 2 because none were found on the surface. The resultant Exposure Factor score is 4 (Likely to be Exposed) for hazard type 1.				
		MEC Type 1	One MEC hazard type 1 item was found on the surface.				
Receptor Type	Subs	surface Intruder	(expected to intrude up to 5 feet below the surface)				
	Accessibil Factor 5		An accessibility factor a score of 5 (Greatest Potential for Accessibility) was calculated for a subsurface receptor for MEC hazard types 1 and 2. Because only a portion of the area has been investigated, there is a potential that similar MEC items could remain. No MEC hazard type 3 items have been found in sub-area B-2 to date.				
MEC Risk Score	"E"	Exposure Factor 4	The Frequency of Entry for a subsurface receptor is frequent and the Intensity of Contact with soil is high. A MEC density input score of 3 (medium) was used for hazard types 1 and 2. A MEC density input score was not used for hazard type 3 as none were found. The resultant Exposure Factor score is 4 (Likely to be Exposed) for hazard types 1 and 2.				
		MEC Type 1, 2	The type of MEC discovered includes hazard types 1 and 2.				
	Data	Quality	The data used in preparing the Baseline Risk Analysis was collected according to the work plan and is considered usable for performing the risk assessment.

Proposed Reuse	Habi	Habitat/Recreational				
Analysis	Base	line				
Receptor Type	Surfa	Surface Receptor (not expected to intrude below the surface)				
		Accessibility Factor 5	An accessibility factor a score of 5 (Greatest Potential for Accessibility) was calculated for a Surface Receptor for all three MEC hazard types based on MEC items cleared at the surface (to a depth of 1 foot in portions) in a majority of the sub-area, but not all portions.			
MEC Risk Score	"E"	Exposure Factor 4	The Frequency of Entry for a Surface Receptor is frequent and the Intensity of Contact with soil is moderate. The MEC density input scores are 3 (medium) for MEC hazard type 1 and 2 (low density) for MEC hazard types 2 and 3. The highest resultant Exposure Factor score is 4 (Likely to be Exposed) for MEC hazard type due to the frequency of entry for the receptor.			
		MEC Type 1, 2, 3	The type of MEC discovered includes hazard types 1, 2, and 3.			
Receptor Type	Subs	urface Recepto	or (expected to intrude up to 5 feet below the surface)			
		Accessibility Factor 5	An accessibility factor a score of 5 (Greatest Potential for Accessibility) was calculated for a Subsurface Receptor for all three MEC hazard types based on clearance of MEC items to a depth of 1 foot and the deeper level of intrusion for the Subsurface Receptor.			
MEC Risk Score	"E"	Exposure Factor 4	The Frequency of Entry for a Subsurface Receptor is frequent and the Intensity of Contact with soil is high. The MEC density input scores are 3 (medium) for all MEC hazard types. The resultant Exposure Factor scores are 5 (Greatest Potential to be Exposed) due to the Intensity of Contact for the receptor.			
		MEC Type 1, 2, 3	The type of MEC discovered includes hazard types 1, 2, and 3.			
	Data	Quality	The data used in preparing the Baseline Risk Analysis was collected according to the work plan and is considered usable for performing the risk assessment.

Source or Authority	Requirement, Standard, or Criterion	Туре	Description	Remarks						
	Federal ARARs									
Endangered Species Act (16 USC §§ 1531- 1543)	16 USC § 1536 (a) and (c); 16 USC § 1538 (a)(I)	Applicable (1,2,3)* / Location	Federal agencies are required under Section 7 of the ESA to ensure that their actions do not jeopardize the continued existence of a listed species or result in destruction of or adverse modification of its critical habitat (16 USC § 1536). If the proposed action may affect the listed species or its critical habitat, consultation with the U.S. Fish and Wildlife Service (USFWS) and/or California Fish and Wildlife may be required (50 CFR § 402. 14). Additionally, Section 9 of the ESA prohibits the illegal taking of a listed species (16 USC§ 1538(a)(I).	The Army has completed an endangered species, Section 7 consultation, and the USFWS has issued several Biological Opinions for the Army disposal and reuse actions at the former Fort Ord. Endangered plant and animal species and critical habitats occur at Fort Ord. Each reuse area will be screened for potential impacts to any endangered species identified in the <i>Installation-Wide Multispecies Habitat Management Plan</i> (HMP; <i>USACE</i> , 1997) and additional requirements identified in subsequent documents (<i>USACE</i> , 2005; <i>USFWS</i> , 1999, 2002, 2005; <i>Zander</i> , 2002). The provisions of the HMP and referenced additional requirements satisfy the requirements of the ESA.						
Migratory Bird Treaty Act (MBTA)	16 U.S.C. §§703·712	Applicable (1,2,3) / Location	The statute sections prohibit the taking, possession of, buying, selling, purchasing, or bartering of any migratory bird, including feathers or other parts, nest eggs, or products, except as allowed by regulations.	The requirement includes specific standards of control. USFWS has issued a non-jeopardy biological opinion for Army predisposal actions to include the remediation of MEC, which provides that vegetation clearance activities occur outside the nesting seasons for migratory birds.						
Hazardous Materials & Transportation Act	49 CFR Part 172. 101	Applicable (3) /Chemical and Action	These regulations impose procedures and controls on the transportation of hazardous materials.	The regulations include specific standards of control and substantive requirements, criteria and limitations that may apply to the transport of detonation materials and selected recyclable ordnance materials.						
Federal Resource Conservation and Recovery Act (RCRA), Subpart M (Military Munitions Rule)	40 CFR Parts 266 and 270	Relevant and Appropriate (2,3) / Chemical and Action	The regulations identify when military munitions on active ranges become subject to the regulatory definition of "solid waste", for purposes of Subtitle C, and if these wastes are hazardous, the management standards which apply.	Portions of the Rule may be relevant and appropriate, but those provisions of the Rule which exclude military munitions from RCRA Subtitle C regulations are not appropriate to the remediation of a closed range. The relevant portions relate to the management of MEC which is recovered, including characterization as hazardous waste and requirements for treatment, storage, and transportation. The Rule provides for the storage and transportation of recovered military munitions in accordance with DDESB standards.						
			State of California ARARs							
California Endangered Species Act	Fish and Game Code §§ 2051 et seq.; §2080.	Relevant and Appropriate (1,2,3) / Location	The statute sections provide a declaration of policy and definitions. Section 2080 provides that no person shall take, possess, purchase, or sell within this state, any species, or any part or product thereof, that the commission determines to be an endangered species or a threatened species, or attempt any of those acts.	Section 2080 includes specific standards of control with respect to the taking of endangered or threatened species. Under CERCLA, the Army is not required to comply with non-substantive, procedural and administrative provisions of §2051. The Army has coordinated the development of the HMP with CDFW and that mitigation measures to protect both State and federal rare, threatened and endangered species have been identified and will be implemented during the Army's action of MEC remediation if selected for implementation.						
California Fish and Game Code	§3511	Relevant and Appropriate (1,2,3) / Location	This statute section prohibits taking or possessing fully protected birds or parts thereof, listed as: (a) American peregrine falcon (Falco peregrinus anatum) (b) Brown pelican (c) California black rail (Laterallus jamaicensis) (d) California clapper rail (Rallus longirostris obsoletus) (e) California condor (Gymnogyps californianus) (f) California least tern (Sterna albifrons browni) (g) Golden eagle (h) Greater sandhill crane (Gnus Canadensis tabida) (i) Lightfooted clapper rail (Rallus longirostris levipes) (j) Southern bald eagle (Haliaeetus leucocephalus) (k) Trumpeter swan (Cygllus buccinator) (l) Whitetailed kite (Elanus leucurus) (m) Yuma clapper rail (Rallus longirostris yumanensis).	The requirement includes specific standards of control that may apply to the American peregrine falcon (some possibility), golden eagle (slight possibility), brown pelican (not likely but possible), and California least tern (not likely but possible). Vegetation clearance activities will occur outside the nesting seasons for these protected birds.						

Source or Authority	Requirement, Standard, or Criterion	lard, or Type Description		Remarks				
California Fish and Game Code	§3513	Relevant and Appropriate (1,2,3) / Location	This statute section declares that it is unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Treaty Act.	The requirement includes specific standards of control. USFWS has issued a non-jeopardy biological opinion for Army predisposal actions to include the remediation of MEC. In addition, vegetation clearance activities will occur outside the nesting seasons for migratory birds.				
California Fish and Game Code	§3503.5	Relevant and Appropriate (1,2,3) / Location	This statute section prohibits the take, possession or destruction of any birds in the orders of Falconiformes or Strigiformes, or to take, possess, or destroy the nest or eggs of any such bird, except as provided in the code.	The requirement includes specific standards of control that may apply to vultures, hawks, ospreys, falcons and owls. Vegetation clearance activities will occur outside the nesting seasons for these birds				
California Fish and Game Code	Title 14, CCR §472	Relevant and Appropriate (1,2,3) / Location	This regulation limits the taking of nongame birds and mammals except for specified species.	The requirement includes specific standards of control that may affect American crows. Vegetation clearance activities will occur outside the nesting seasons.				
California Fish and Game Code	§4800 et. seq.	Relevant and Appropriate (1,2,3) / Location	This statute section declares that it is unlawful to take, injure, possess, transport or sell any mountain lion.	The requirement includes specific standards of control. Due to the size of vegetation clearance and MEC remediation activities that may be selected for implementation, it is unlikely that mountain lions will be negatively affected. In fact, the use of fire to set back plant community succession will result in an improvement to wildlife habitat that will benefit mountain lions.				
California Fish and Game Code	Title 14, CCR §§40- 42	Relevant and Appropriate (1,2,3) / Location	These regulations make it unlawful to take, possess, purchase, propagate, sell, transport, import, or export any native reptile or amphibian, unless under special permit.	The requirement includes specific standards of control that may apply to black legless lizard and coast homed lizard. CDFW was heavily involved in the development of the HMP, which included the development of mitigation measures to protect the California black legless lizard.				

	Requirement,			
Source or Authority	Standard, or Criterion	Туре	Description	Remarks
California Clean Air Act (Health and Safety Code)	Monterey Bay Unified Air Pollution Control District Rule 438 (Open Outdoor Fires; Adopted 4-16- 2003; Revised 9-15- 2004; October 19, 2011; and September 19, 2012)	Applicable (1) / Action	These prohibitory rules describe permit requirements, allowable days for burning, and restrictions. The rules include both substantive and procedural requirements regarding open burning.	The rule includes specific standards of control. It also includes non-substantive procedural and administrative provisions with which the Army, under CERCLA, is not required to comply. Substantive requirements: §3.4, prohibiting burn on no-burn days. The Army will conduct prescribed burns on allowable days in accordance with CCR Title 17, §80110. §3.5, burn authorization by the Air District or the local fire jurisdiction is required. §3.7.10, burn shall be ignited only by devices and methods approved by the California Department of Forestry and Fire Protection. The Army will use ignition devices approved by CDF. §3.7, materials to be burned shall be dry and reasonably free of dirt, soil and visible surface moisture prior to burning, and shall be free from combustible impurities such as tires, tar paper, household rubbish, demolition or construction debris, and other materials not grown at a site. The Army will comply with this section by removing tires, structures and other debris from the sites prior to conducting prescribed burns, where it is safe to do so. MEC items have been removed from the areas where accessible and where it was safe to do so. Emissions from incidental detonation of MEC during prescribed burning are expected to be insignificant, based on a study conducted by the Army, in consultation with EPA and DTSC (Technical Memorandum, Air Emissions from Incidental Ordnance Detonation During a Prescribed Burn on Ranges 43 through 48 (Harding ESE, 2001)). The study concluded that air pollutant emissions contributed directly from biomass burning, and will result in pollutant concentration well below health-protective regulatory screening levels. • The regulation is intended to protect the public health. The Army will substantively comply with this regulation by implementing the site preparation measures as described above, as well as conducting the burns in accordance with the smoke management program, and applying resources to contain the fire within the intended boundaries to minimize public ex
California Health and Safety Code, Division 20	Title 22, CCR Division 4.5	Applicable (3) / Chemical and Action	The statute and regulations provide for identification of hazardous waste in §§66261. If a material is a hazardous waste, Division 4.5 provisions further regulate hazardous waste generators, transporters, and treatment, storage, and disposal facilities.	The Army will evaluate discovered items in accordance with the approved work plan to determine the presence of energetic materials or other constituents that would cause it to be characterized as a hazardous waste. Substantive requirements: Storage: onsite storage of MEC items occur in a designated bunker that meets the standard of DDESB 6055.9-M, including security measures such as fences, signs, and an alarm system. Transportation: offsite transportation of small arms ammunition will incorporate applicable manifesting and placarding requirements. Conforms to Defense Reutilization and Marketing Office (DRMO) instruction. Disposal/recycling: offsite disposal or recycling facility or facilities for small arms ammunition will be state and/or RCRA-authorized.

Source or Authority	Requirement, Standard, or Criterion	Туре	Description	Remarks
California Health and Safety Code	Title 22, CCR §66264.601-603	Relevant and appropriate (2) / Action	These regulations apply to hazardous waste treatment which is conducted in a device that does not meet the definition of a "container" in 22 CCR 66260.10 is characterized as a "Miscellaneous Unit" subject to the provisions of 22 CCR 66264.601-603. For activities where detonations are in a device that meet the 22 CCR 66260.10 definition of a container, the requirements for	The regulations include generally described narrative standards. Compliance with substantive requirements is achieved through regulatory coordination of site-specific work plans in accordance with CERCLA and FFA. Under CERCLA, the Army is not required to comply with procedural requirements such as
California Health and Safety Code	Title 22, CCR §66265.382	Relevant and Appropriate (3)/ Chemical and Action	"temporary units," as set forth in 22 CCR 66264.553 apply. Open burning of hazardous waste is prohibited except for the open burning and detonation of waste explosives. Waste explosives include waste which has the potential to detonate and bulk military propellants which cannot safely be disposed of through other modes of treatment. Detonation is an explosion in which chemical transformation passes through the material faster than the speed of sound (0.33 kilometers/second at sea level). Owners or operators choosing to open burn or detonate waste explosives shall do so in accordance with the following table and in a manner that does not threaten human health or the environment. Ib. waste explosives Min. Distance from OB/OD to property	obtaining a permit. The requirement includes specific standards of control and addresses situations similar to those that may be addressed during MEC remediation; detonation of MEC will comply with these requirements.
			0 to 100 204 meters (670 feet) 101 to 1,000 380 meters (1,250 feet) 1,001 to 10,000 530 meters (1,730 feet) 10,001 to 30,000 690 meters (2,260 feet)	
California Fish and Game Code	§ 1900 et. seq.	Relevant and Appropriate (1,2,3)/Action	These statute sections sets forth programmatic and administrative provisions, and in §1908, provides that no person shall import into the state, or take, possess, or sell within this state, except as incident to the possession or sale of the real property on which the plant is growing, any native plant, or any part or product thereof, that the commission determines to be an endangered native plant or rare native plant.	Although the definition of "person" in the statute does not apply to the Army, the standards of control are relevant and appropriate, and the citation is therefore considered as ARAR. The Army is implementing the HMP which contains mitigation measures designed to protect the continued survival of rare and endangered plants.
California Fish and Game Code	Title 14, CCR §783 et. seq.	Relevant and Appropriate (1,2,3)/ Action	These regulations provide that no person shall import into the State, export out of the State or take, possess, purchase, or sell within the State, any endangered species, threatened species, or part or product thereof, or attempt any of those acts, except as otherwise provided in the California Endangered Species Act, Fish and Game Code Section 2050, et seq. ("CESA"), the Native Plant Protection Act, the Natural Community Conservation Planning Act, the California Desert Native Plants Act, or as authorized under this article in an incidental take permit. The regulations also provide programmatic and administrative procedures for incidental take permits.	The Section includes specific standards of control with respect to taking rare or endangered plants. Although the definition of "person" in the statute does not apply to the Army, the standards of control are relevant and appropriate, and the citation is therefore considered as ARAR. The Army is implementing the HMP which contains mitigation measures designed to protect the continued survival of threatened and endangered species.

	Requirement,			
Source or Authority	Standard, or	Туре	Description	Remarks
California Clean Air Act (Health and Safety Code)	Criterion Title 17, CCR §80100 et. seq.	Relevant and Appropriate (1)/ Action	The regulations provide guidelines, programs and agency procedures for smoke management plans.	The regulations are relevant and appropriate. The Army will comply with substantive elements of the regulations. Under CERCLA, the Army is not required to comply with procedural and administrative provisions; however these elements will be addressed as part of the remedial design/remedial action process. Substantive requirements: \$80110(d) prohibiting burn on no-burn days. The Army will conduct prescribed burns on allowable days in accordance with CCR Title 17, \$80110. \$80145(o)(1) [local air district smoke management plan or other enforceable mechanisms shall] require the material to be burned to be free of material that is not produced on the property or in an agricultural or prescribed burning operation. Material not to be burned includes, but not limited to, tires, rubbish, plastic, treated wood, construction/demolition debris, or material containing asbestos. The Army will comply with this section by removing tires, structures and other debris from the sites prior to conducting prescribed burns, where it is safe to do so. MEC items have been removed from the ground surface of the areas where accessible and where it was safe to do so. Emissions from incidental detonation of MEC during prescribed burning are expected to be insignificant, based on a study conducted by the Army, in consultation with EPA and DTSC (Technical Memorandum, Air Emissions from Incidental Ordnance Detonation During a Prescribed Burn on Ranges 43 through 48 (Harding ESE, 2001)). The study concluded that air pollutant emissions from incidental MEC detonation during a prescribed burn will be minor compared to emissions contributed directly from biomass burning, and will result in pollutant concentration well below health-protective regulatory screening levels. • The regulation is intended to protect the public health. The Army will substantively comply with this regulation by implementing the site preparation measures as described above, as well as conducting the burns in accordance with the smoke management
				program, and applying resources to contain the fire within the intended boundaries to minimize public exposure to smoke.
		Sta	te of California TBC - considered in the review of potential ARARs but not appli	cable or relevant and appropriate
California Fish and Game Commission	Wetlands Resources (pursuant to § 703 of California Fish and Game Code; not a statute)	Policy (1,2,3) / Location	This policy (1) seeks to provide for the protection, preservation, restoration, enhancement and expansion of wetland habitat in California; (2) strongly discourages development in or conversion of wetlands; and (3) opposes, consistent with its legal authority, any development or conversion which would result in a reduction of wetland acreage or wetland habitat values. To that end, the Commission (1) opposes wetland development proposals unless, at a minimum, project mitigation assures there will be "no net loss" of either wetland habitat values or acreage; and (2) strongly prefers mitigation which would achieve expansion of wetland acreage and enhancement of	The policy provides for the protection of wetland resources. CDFW was heavily involved in the development of the HMP (and subsequent Wetland Resources Protection Plan specific to former Fort Ord), which include the development of mitigation measures to protect wetland resources.

Source or Authority	Requirement, Standard, or Criterion	Туре	Description	Remarks				
			Regulations that were considered as potential ARARs but were not co	onsidered applicable.				
California Fish and Game Code	§3005		The statute section prohibits the taking of birds or mammals, except nongame mammals, with any net, pound, cage, trap, set line or wire, or poisonous substance. Included in the term "taking" is the killing of birds or mammals by poison.	Birds and mammals will be protected by achieving the identified Remedial Action Objectives (RAOs). Further, the scope of the remedial actions does not include intentional taking of birds and mammals with unlawful devices.				
California Fish and Game Code	§4000 et. seq.		This statute section provides that a fur-bearing mammal may be taken only with a trap, firearm, bow and arrow, poison under a proper permit, or with the use of dogs.	The scope of the remedial actions does not involve intentional taking of fur-bearing mammals with unlawful devices.				
California Fish and Game Code	Title 14, CCR §460		This regulation makes it unlawful to take Fisher, marten, river otter, desert kit fox and red fox.	The remedial actions will not result in the taking of Fisher, marten, river otter, desert kit fox and red fox. The species of red fox protected by the State is located in the Sierra Nevada mountain range. The species of red fox located at former Fort Ord is an introduced species and is not protected by this section.				
California Clean Air Act	Health and Safety Code §41701		This statute section prohibits the discharge into the atmosphere from any source whatsoever any air contaminant for a period or periods aggregated more than three minutes in anyone hour which is dark or darker than No.2 on the Ringelmann Chart or obscures the view to a degree equal to or greater than smoke.	Agricultural burning for which a permit has been granted pursuant to Article 3 (commencing with §41850, emission limitations for agricultural burning) are exempt from this requirement per §4I704(b). Any prescribed burns that would be conducted for vegetation removal prior to MEC will be conducted in a manner that comply with substantive requirements of Rule 438, which implements the requirements of Article 3 (California Health and Safety Code §41850 et. seq.). The exemption applies though the Army is not required to obtain a permit under CERCLA.				

^{* 1 =} Vegetation Clearance; 2 = MEC Remediation; 3 = Detonation of MEC

Table 5-2. SUMMARY OF REMEDIAL ALTERNATIVES EVALUATION Remedial Investigation/Feasibility Study, BLM Area B and MRS-16, Former Fort Ord California

	Threshold Crit	eria	Balancing Criteria						Modifying Criteria	
Remedial Alternative	Overall Protection of Human Health and the Environment	Compliance with ARARs	Short-Term Effectiveness	Long-Term Effectiveness and Permanence	Reduction of T, M, V Through Treatment	Implementability	Cost	State Acceptance	Community Acceptance	
B-1 Alternative 1 No Further Action	NFA would be protective of human health for recreational users who stay on established roads and trails, but may not be protective of surface or subsurface receptors within subarea B-1.	No ARARs were identified for this alternative.	Not effective in the short term because no further action is taken.	Not effective or permanent in the long term because no further action would be taken to address potential MEC risks.	Does not provide reduction of toxicity, mobility, or volume because no further action would be taken.	Not administratively feasible to implement. While the NFA alternative would be easy to implement, the necessary approvals are not expected.	No Cost	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	
B-1 Alternative 2 Land Use Controls	Protective of human health and the environment. Mitigates potential MEC risks remaining.	No ARARs were identified for this alternative.	Effective in the short term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Effective and permanent in the long term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Does not provide reduction of toxicity, mobility, or volume because no MEC removal would be conducted.	Administratively feasible. Moderate level of effort to implement from a technical perspective.	\$67,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	
B-1 Alternative 3 Technology-aided Surface MEC Removal, with Subsurface MEC Removal in Selected Areas, and LUCs	Protective of human health and the environment. Mitigates potential MEC risks remaining. Vegetation removal by prescribed burns would be beneficial for the environment.	MEC remediation would be implemented in compliance with ARARs.	Effective in the short term. Workers and the community would be protected during prescribed burning and MEC removal by safety protocols.	Effective and permanent in the long term because all MEC detected on the surface and the subsurface in select areas would be removed and LUCs would mitigate potentially remaining MEC risks.	Provides reduction through surface MEC and subsurface MEC removal in select areas.	Administratively feasible. High level of effort to implement from a technical perspective.	\$3,252,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	
B-1 Alternative 4 Subsurface MEC Remediation	Protective of human health and the environment. Mitigates potential MEC risks remaining. Vegetation removal by prescribed burns would be beneficial for the environment.	MEC remediation would be implemented in compliance with ARARs.	Effective in the short term. Workers and the community would be protected during vegetation and MEC removal by safety protocols.	Effective and permanent in the long term because all MEC detected on the surface and in the subsurface would be removed.	Provides reduction through surface MEC and subsurface MEC removal.	Administratively feasible. High level of effort to implement from a technical perspective.	\$4,633,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	
B-2 Alternative 1 No Further Action	NFA would be protective of human health for recreational users who stay on established roads and trails, but may not be protective of surface or subsurface receptors within subarea B-2.	No ARARs were identified for this alternative.	Not effective in the short term because no further action is taken.	Not effective or permanent in the long term because no further action would be taken to address potential MEC risks.	Does not provide reduction of toxicity, mobility, or volume because no further action would be taken.	Not administratively feasible to implement. While the NFA alternative would be easy to implement, the necessary approvals are not expected.	No Cost	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.

			Nine CERCLA Evaluation Criteria						
	Threshold Crit	eria		Balancing Criteria					
Remedial Alternative	Overall Protection of Human Health and the Environment	Compliance with ARARs	Short-Term Effectiveness	Long-Term Effectiveness and Permanence	Reduction of T, M, V Through Treatment	Implementability	Cost	State Acceptance	Community Acceptance
B-2 Alternative 2 Land Use Controls	Protective of human health and the environment. Mitigates potential MEC risks remaining.	No ARARs were identified for this alternative.	Effective in the short term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Effective and permanent in the long term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Does not provide reduction of toxicity, mobility, or volume because no MEC removal would be conducted.	Administratively feasible. Moderate level of effort to implement from a technical perspective.	\$86,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
B-2 Alternative 3 Technology-aided Surface MEC Removal, with Subsurface MEC Removal in Selected Areas, and LUCs	Protective of human health and the environment. Mitigates potential MEC risks remaining. Vegetation removal by prescribed burns would be beneficial for the environment.	MEC remediation would be implemented in compliance with ARARs.	Effective in the short term. Workers and the community would be protected during prescribed burning and MEC removal by safety protocols.	Effective and permanent in the long term because all MEC detected on the surface and select areas of subsurface would be removed and LUCs would mitigate potentially remaining MEC risks.	Provides reduction through surface MEC and subsurface MEC removal in select areas.	Administratively feasible. High level of effort to implement from a technical perspective.	\$3,808,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
B-2 Alternative 4 Subsurface MEC Remediation	Protective of human health and the environment. Mitigates potential MEC risks remaining. Vegetation removal by prescribed burns would be beneficial for the environment.	MEC remediation would be implemented in compliance with ARARs.	Effective in the short term. Workers and the community would be protected during prescribed burning and MEC removal by safety protocols.	Effective and permanent in the long term because all MEC detected on the surface and in the subsurface would be removed.	Provides reduction through surface MEC and subsurface MEC removal.	Administratively feasible. High level of effort to implement from a technical perspective.	\$5,497,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
B-2A Alternative 1 No Further Action	NFA would be protective of human health for recreational users who stay on established roads and trails, but may not be protective of surface or subsurface receptors within subarea B-2A.	No ARARs were identified for this alternative.	Not effective in the short term because no further action is taken.	Not effective or permanent in the long term because no further action would be taken to address potential MEC risks.	Does not provide reduction of toxicity, mobility, or volume because no further action would be taken.	Not administratively feasible to implement. While the NFA alternative would be easy to implement, the necessary approvals are not expected.	No Cost	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
B-2A Alternative 2 Land Use Controls	Protective of human health and the environment. Mitigates potential MEC risks remaining.	No ARARs were identified for this alternative.	Effective in the short term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Effective and permanent in the long term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Does not provide reduction of toxicity, mobility, or volume because no MEC removal would be conducted.	Administratively feasible. Moderate level of effort to implement from a technical perspective.	\$45,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.

B-5 Alternative 4 Subsurface MEC Remediation	Protective of human health and the environment. Mitigates potential MEC risks remaining. Dewatering of Mudhen Lake and subsurface MEC removal would be conducted with appropriate mitigation measures to minimize habitat impact.	MEC remediation would be implemented in compliance with ARARs.	Effective in the short term. Workers and the community would be protected during vegetation and MEC removal by safety protocols.	Effective and permanent in the long term because all MEC detected on the surface and in the subsurface would be removed.	Provides reduction through surface MEC and subsurface MEC removal.	Administratively feasible. High level of effort to implement from a technical perspective.	\$3,134,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
B-6 Alternative 1 No Further Action	NFA would be protective of human health for recreational users who stay on established roads and trails, but may not be protective of surface or subsurface receptors within subarea B-6.	No ARARs were identified for this alternative.	Not effective in the short term because no further action is taken.	Not effective or permanent in the long term because no further action would be taken to address potential MEC risks.	Does not provide reduction of toxicity, mobility, or volume because no further action would be taken.	Not administratively feasible to implement. While the NFA alternative would be easy to implement, the necessary approvals are not expected.	No Cost	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
B-6 Alternative 2 Land Use Controls	Protective of human health and the environment. Mitigates potential MEC risks remaining.	No ARARs were identified for this alternative.	Effective in the short term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Effective and permanent in the long term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Does not provide reduction of toxicity, mobility, or volume because no additional MEC removal would be conducted.	Administratively feasible. Moderate level of effort to implement from a technical perspective.	\$61,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
B-6 Alternative 3	Not Applicable			,	,	, ,	,		,
B-6 Alternative 4 Subsurface MEC Remediation	Protective of human health and the environment. Mitigates potential MEC risks remaining.	MEC remediation would be implemented in compliance with ARARs.	Effective in the short term. Workers and the community would be protected during the implementation of vegetation and MEC removal via safety protocols.	Effective and permanent in the long term because all MEC detected on the surface and in the subsurface would be removed.	Provides reduction through surface and subsurface MEC removal.	Administratively feasible. High level of effort to implement from a technical perspective.	\$2,527,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
MRS-16 Alternative 1 No Further Action	NFA would be protective of human health for recreational users who stay on established roads and trails, but may not be protective of surface or subsurface receptors within the "saturated area" of MRS-16.	No ARARs were identified for this alternative.	May be effective in the short term because all detected MEC items have been removed from the site.	Not effective or permanent in the long term because no further action would be taken to address potential MEC risks.	Does not provide reduction of toxicity, mobility, or volume because no further action would be taken.	May not be administratively feasible to implement. While the NFA alternative would be easy to implement, the necessary approvals are not expected.	No Cost	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.

				Nine CERCLA Evalua	ation Criteria				
	Threshold Crit	eria		Bala	ncing Criteria			Modifyin	g Criteria
Remedial Alternative	Overall Protection of Human Health and the Environment	Compliance with ARARs	Short-Term Effectiveness	Long-Term Effectiveness and Permanence	Reduction of T, M, V Through Treatment	Implementability	Cost	State Acceptance	Community Acceptance
MRS-16 Alternative 2 Land Use Controls	Protective of human health and the environment. Mitigates potential MEC risks remaining.	No ARARs were identified for this alternative.	Effective in the short term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Effective and permanent in the long term because potential MEC risks are mitigated by MEC recognition and safety training, construction support, and public education.	Does not provide reduction of toxicity, mobility, or volume because no additional MEC removal would be conducted.	Administratively feasible. Moderate level of effort to implement from a technical perspective.	\$49,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.
MRS-16 Alternative 3	Not Applicable								
MRS-16 Alternative 4 Subsurface MEC Remediation	Protective of human health and the environment. Mitigates potential MEC risks remaining. Subsurface MEC removal that involves excavation and sifting would be conducted with appropriate mitigation measures to minimize habitat impact.	MEC remediation would be implemented in compliance with ARARs.	Effective in the short term. Workers and the community would be protected during MEC removal by safety protocols.	Effective and permanent in the long term because the subsurface MEC removal would be conducted in the "saturated area."	Provides reduction through subsurface MEC removal in the "saturated area."	Administratively feasible. High level of effort to implement from a technical perspective.	\$817,000	Addressed in the resulting ROD once comments on the Proposed Plan have been received.	Addressed in the resulting ROD once comments on the Proposed Plan have been received.

Table 5-3. Summary of Remedial Alternative Costs BLM Area B and MRS-16, Track 2 Feasibility Study Former Fort Ord, California

	Remedial Alternative	Total Capital Costs	Total 30 Year Annual Costs	Total Remedial Alternative Cost
	Long Term Management Measures	\$22,000	\$388,000	\$410,000
	Alternative 1 No Further Action	No Costs	No Costs	No Costs
	Alternative 2 Land Use Controls	\$985	\$65,689	\$66,674
B-1	Alternative 3 Technology Aided Surface MEC Remediation, with Subsurface MEC Remediation in Select Areas, and Land Use Controls	\$3,186,000	\$66,000	\$3,252,000
	Alternative 4 Subsurface MEC Remediation	\$4,633,000	\$0	\$4,633,000

DMM = Discarded military munitions

in = inches

ISD = insufficient data

MD = Munitions debris

MEC = Munitions and explosives of concern

UXO = Unexploded ordnance

-- = unknown

The * in MM item description field means there is no equivalent Master Pick List nomenclature for the item, the nomenclature from the original grid sheet was used.

MM = Military Munitions

in. = inches

ISD = insufficient data

MD = Munitions debris

UXO = Unexploded ordnance

The * in MM item description field means there is no equivalent Master Pick List nomenclature for the item, the nomenclature from the original grid sheet was used.
