Definitions

Construction Support: Assistance provided by Department of Defense (DoD) explosive ordnance disposal (EOD) or Unexploded Ordnance (UXO)-qualified personnel and/or by personnel trained and qualified for operations involving chemical agent (CA), regardless of configuration, during intrusive construction activities on property known or suspected to contain UXO, other munitions that may have experienced abnormal environments [e.g., Discarded Military Munitions (DMM)], or munitions constituents in high enough concentrations to pose an explosive hazard, or CA, regardless of configuration, to ensure the safety of personnel or resources from any potential explosive or CA hazards. Source: (7).

Discarded Military Munitions (DMM): Military munitions that have been abandoned without proper disposal or removed from storage in a military magazine or other storage area for the purpose of disposal. The term does not include unexploded ordnance, military munitions that are being held for future use or planned disposal, or military munitions that have been properly disposed of consistent with applicable environmental laws and regulations. (10 U.S.C. 2710 (e)(2)). For the purposes of the Military Munitions Response Program (MMRP) being conducted at the former Fort Ord, DMM does not include small arms ammunition.

Explosive Ordnance Disposal (EOD) Personnel: Military personnel who have graduated from the Naval School, Explosive Ordnance Disposal; are assigned to a military unit with a Service-defined EOD mission; and meet Service and assigned unit requirements to perform EOD duties. EOD personnel have received specialized training to address explosive and certain CA hazards during both peacetime and wartime. EOD personnel are trained and equipped to perform render safe procedures (RSP) on nuclear, biological, chemical, and conventional munitions, and on improvised explosive devices. Source: (7).

Expended: The state of munitions debris (MD) in which the main charge has been expended leaving the inert carrier. Source: (1).

Feasibility Study (FS): A study undertaken to develop and evaluate alternatives for remedial action. Source: (3).

Impact Area: The historical impact area consists of approximately 8,000 acres in the southwestern portion of former Fort Ord, bordered by Eucalyptus Road to the north, Barloy Canyon Road to the east, South Boundary Road to the south, and General Jim Moore Boulevard to the west. Source: (1). The ground and associated airspace within the training complex used to contain fired, placed, dropped, thrown, or launched AE [ammunition and explosives] and the resulting fragments, debris, and components from various weapon systems. Indirect-fire weapon system impact areas include PE [probable error] for range and deflection. Direct-fire weapon system impact areas encompass the total SDZ [surface danger zone] from the firing point or position down range to Distance X. It also includes Area B [buffer zone] when required. Source: (8).

Institutional Control: (a) Non-engineered instruments such as administrative and/or legal controls that minimize the potential for human exposure to contamination by limiting land or resource use; (b) are generally to be used in conjunction with, rather than in lieu of, engineering measures such as waste treatment or containment; (c) can be used during all stages of the cleanup process to accomplish various cleanup-related objectives; and (d) should be "layered" (i.e., use multiple ICs) or implemented in a series to provide overlapping assurances of protection from contamination. Source: (6).

Land Use Controls (LUCs): Physical, legal, or administrative mechanisms that restrict the use of, or limit access to, real property, to manage risks to human health and the environment. Physical mechanisms encompass a variety of engineered remedies to contain or reduce contamination, or physical barriers to limit access to real property, such as fences or signs. Source: (7).

Magnetometer: An instrument used to detect ferromagnetic (iron-containing) objects. Total field magnetometers measuring the strength of the earth's natural magnetic field at the magnetic sensor location. Gradient magnetometers, sensitive to smaller near-surface metal objects, use two sensors to measure the difference in magnetic field strength between the two sensor locations. Vertical or horizontal gradients can be measured. Source: (4).

Material Documented as Safe (MDAS): Material Potentially Presenting an Explosive Hazard (MPPEH) that has been assessed and documented as not presenting an explosive hazard and for which the chain of custody has been established and maintained. This material is no longer considered to be MPPEH. Source: (7).

Material Documented as an Explosive Hazard (MDEH): MPPEH that cannot be documented as MDAS, that has been assessed and documented as to the maximum explosive hazards the material is known or suspected to present, and for which the chain of custody has been established and maintained. This material is no longer considered to be MPPEH. Source: (7).

Material Potentially Presenting an Explosive Hazard (MPPEH): Material owned or controlled by the DoD that, before determination of its explosives safety status, potentially contains explosives or munitions (e.g., munitions containers and packaging material; munitions debris remaining after munitions use, demilitarization, or disposal; and range-related debris) or potentially contains a high enough concentration of explosives that the material presents an explosive hazard (e.g., equipment, drainage systems, holding tanks, piping, or ventilation ducts that were associated with munitions production, demilitarization, or disposal operations). Excluded from MPPEH are:

Military munitions and military munitions-related materials, including wholly inert components (e.g., fins, launch tubes, containers, packaging material), that are to be used or reused for their intended purpose and are within a DoD Component-established munitions management system.

Non-munition-related material (e.g., horseshoes, rebar, other solid objects) and munitions debris that are solid metal fragments that do not realistically present an explosive hazard.

Other items (e.g., gasoline cans, compressed gas cylinders) that are not munitions or munitions-related material but may present an explosion hazard. Source: (7).

Military Munitions: Military munitions mean all ammunition products and components produced for or used by the armed forces for national defense and security, including ammunition products or components under the control of the DoD, the Coast Guard, the Department of Energy, and the National Guard. The term includes confined gaseous, liquid, and solid propellants, explosives, pyrotechnics, chemical and riot control agents, smokes, and incendiaries, including bulk explosives and chemical warfare agents, chemical munitions, rockets, guided and ballistic missiles, bombs, warheads, mortar rounds, artillery ammunition, small arms ammunition, grenades, mines, torpedoes, depth charges, cluster munitions and dispensers, demolition charges, and devices and components thereof. The term does not include wholly inert items, improvised explosive devices, or nuclear weapons, nuclear devices, and nuclear components, other than non-nuclear components of nuclear devices that are managed under the nuclear weapons program of the Department of Energy after all required sanitization operations under the Atomic Energy Act of 1954 (42 U.S.C. 2011 et seq.) have been completed. (10 U.S.C. 101(e)(4)).

Military Munitions Response Program (MMRP): The MMRP is a program under which munitions responses are conducted. Source: (1)

Mortar: Mortars typically range from approximately 1 inch to 11 inches in diameter or larger, and can be filled with explosives, toxic chemicals, white phosphorus or illumination flares. Mortars generally have thinner metal casing than projectiles but use the same types of fusing and stabilization. Source: (2).

Munitions Debris (MD): Remnants of munitions (e.g., fragments, penetrators, projectiles, shell casings, links, fins) remaining after munitions use, demilitarization, or disposal. Source: (7).

Munitions and Explosives of Concern (MEC): A term distinguishing specific categories of military munitions that may pose unique explosives safety risks: UXO, as defined in 10 U.S.C. 101(e) (5); DMM, as defined in 10 U.S.C. 2710(e)(2)); or munitions constituents [e.g., TNT, cyclotrimethylenetrinitramine (RDX)], as defined in 10 U.S.C. 2710(e)(3)), present in high enough concentrations to pose an explosive hazard. Source: (7). For the purposes of the MMRP being conducted for the former Fort Ord, MEC does not include small arms ammunition.

Munitions Response: Munitions response means response actions, including investigation, removal actions, and remedial actions, to address the explosives safety, human health, or environmental risks presented by UXO, DMM, or munitions constituents (MC), or to support a determination that no removal or remedial action is required. (32 CFR 179.3)

Munitions Response Area (MRA): Any area on a defense site that is known or suspected to contain UXO, DMM, or MC. Examples include former ranges and munitions burial areas. An MRA is comprised of one or more munitions response sites. Source: (7).

Munitions Response Site (MRS): A discrete location within an MRA that is known to require a munitions response. Source: (7).

Operating Grids: Typically, 100-foot by 100-foot parcels of land as determined by survey and recorded by global positioning system (GPS), marked at each corner with wooden stakes. Sites are divided into operating grids prior to the commencement of work by brush removal or MEC sweep teams. A single grid may be occupied by only one team at any time, and the grid system facilitates the maintenance of safe distances between teams. They are identified sequentially using an alphanumeric system (e.g., E-5). Source: (1).

Projectile: An object projected by an applied force and continuing in motion by its own inertia, such as a bullet, bomb, shell, or grenade. Also, applied to rockets and to guided missiles. Source: (2).

Range-Related Debris: Debris, other than MD, collected from operational ranges or from former ranges (e.g., target debris, military munitions packaging and crating material). Source: (7).

Remedial Investigation (RI): Process undertaken to determine the nature and extent of the problem presented by a release which emphasizes data collection and site characterization. The RI is generally performed concurrently and in an interdependent fashion with the FS. Source: (3).

Removal Depth: The depth below ground surface to which all ordnance and other detected items are removed. Source: (1).

Small Arms Ammunition: Ammunition, without projectiles that contain explosives (other than tracers), that is .50 caliber or smaller, or for shotguns. Source: (7).

Technology-Aided Surface Removal: A removal of UXO, DMM, or Chemical Warfare Material (CWM) on the surface (i.e., the top of the soil layer) only, in which the detection process is primarily performed visually, but is augmented by technology aids (e.g., hand-held magnetometers or metal detectors) because vegetation, the weathering of UXO, DMM, or CWM, or other factors make visual detection difficult. Source: (7).

Unexploded Ordnance (UXO): Military munitions that: (A) Have been primed, fused, armed, or otherwise prepared for action; (B) Have been fired, dropped, launched, projected, or placed in such a manner as to constitute a hazard to operations, installations, personnel, or materials; and (C) Remain unexploded, whether by malfunction, design, or any other cause. (10 U.S.C. 101 (e) (5)). For the purpose of the MMRP being conducted for the former Fort Ord, UXO does not include small arms ammunition.

UXO-Qualified Personnel: Personnel who have performed successfully in military EOD positions, or are qualified to perform in the following Department of Labor, Service Contract Act, Directory of Occupations, contractor positions: UXO Technician II, UXO Technician III, UXO Safety Officer, UXO Quality Control Specialist, or Senior UXO Supervisor. Source: (7).

UXO Technician: Personnel who are qualified for and filling Department of Labor, Service Contract Act, Directory of Occupations, contractor positions of UXO Technician I, UXO Technician II, and UXO Technician III. Source: (7).

Executive Summary

This Remedial Action Report documents completion of munitions and explosives of concern (MEC) remedial actions within the permanent fuel break system of the Impact Area Munitions Response Area (MRA) at the former Fort Ord, California (Figure 1). Across all phases of work from 1997 through 2023, a total of 1,130 MEC items were removed, and all previously identified explosive hazards within the fuel break system were resolved. Subsurface MEC removal was not completed in asphalt sections along portions of Austin Road, Hugo Road, and Orion Road. Subsurface MEC removal was also not completed in asphalt areas beneath perimeter gates providing access to the Impact Area MRA. The selected remedy includes a requirement for construction support for ground-disturbing activities. These actions fulfill the requirement for subsurface MEC removal to be conducted in the regularly maintained fuel breaks and access roads within the Impact Area Munitions Response Area (MRA), as described in the *Final Track 3 Record of Decision (ROD), Impact Area Munitions Response Area, Track 3 Munitions Response Site, Former Fort Ord, California* [Track 3 ROD] (Army, 2008).

The Impact Area MRA spans 6,560 acres within a designated habitat reserve and contains approximately 184 acres of permanent fuel breaks that provide essential wildfire control and access (Figure 2). The fuel breaks are 45 to 50 feet wide and consist of a central road approximately 15 to 20 feet wide, with 15-foot-wide areas cleared of vegetation on either side of the fuel break road. Originally constructed by the U.S. Army to manage fire risks associated with historic munitions training, the fuel break system has evolved to meet land management and fire response needs following base closure. The Presidio of Monterey Fire Department currently provides fire protection within the Impact Area MRA.

MEC removal activities were conducted across multiple phases from 1997 through 2023 under U.S. Army Corps of Engineers (USACE) oversight. This report consolidates the results of investigation and removal activities documented in Appendix A, Appendix B, and Appendix C to present a complete record of the remedial action. Figure 3 displays an overview of the MEC recovered.

Munitions responses conducted within the fuel breaks occurred in four separate efforts:

(1) activities completed prior to the May 2008 signature of the Track 3 ROD (Army, 2008),
(2) post-ROD remedial actions conducted from 2008 through 2015 by Shaw Environmental and ITSI Gilbane,
(3) remedial actions conducted from 2015 through 2019 by KEMRON; and
(4) supplemental subsurface MEC removal using Advanced Geophysical Classification (AGC) conducted in 2018–2020 and 2023 by KEMRON.

Pre-ROD efforts relied on analog detection methods, while post-ROD efforts employed a combination of analog detection (Schonstedt) and intrusive investigation of anomalies selected from digital geophysical mapping (DGM) using Electromagnetic 61 (EM61). The results of these efforts are documented in a Technical Information Paper (TIP) comprising three volumes, with

Volume 1 addressing Efforts 1 through 3, and Volumes 2 and 3 addressing the supplemental subsurface MEC removal utilizing AGC.

To address the potential for MEC remaining within portions of the Impact Area MRA fuel breaks, additional subsurface MEC removal was recommended in areas totaling approximately 25.5 acres where the following conditions were present: analog subsurface removal conducted prior to the Track 3 ROD, high pre-analog survey anomaly density, and previous recovery of 81-millimeter (mm) mortar projectiles. Supplemental subsurface MEC removal utilizing AGC was conducted within portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road. The investigation, completed during two mobilizations (2018–2020 and 2023), included a dynamic detection survey that identified 23,023 subsurface anomalies for classification; a classification effort that selected 11,416 anomalies for intrusive investigation; intrusive investigation of the selected anomalies and more than 700 verification targets; limited analog removal within two grids with very high anomaly density and in areas inaccessible to AGC detection surveys; and recovery of a total of 42 MEC items.

The MEC remedial action (subsurface removal) for the fuel breaks within the Impact Area MRA is complete. Table 1 presents a chronology of major remedial action activities for the Impact Area MRA fuel break system. Table 2 summarizes MEC items located and removed by fuel break grid, organized by segment with totals for each segment. Table 3, “Comprehensive MEC by Segment for the Fuel Break System,” consolidates this information to provide an overall summary of MEC quantities and locations. Figures 4 through 11 present spatial distributions of recovered MEC and MD weight per grid. Figures 4 through 7 depict the spatial distribution of recovered MEC, while Figures 8 through 11 depict MD weight per grid. Additional detail is provided in Appendices A through C, with former fuel break segments no longer part of the active system shown in Appendix A, Figure 3.

1.0 Introduction

This Remedial Action Report (RAR) documents the completion of munitions and explosives of concern (MEC) removal within the permanent fuel break system of the Impact Area Munitions Response Area (MRA) at former Fort Ord, California (Figure 1). These actions fulfill the requirement for subsurface MEC removal to be conducted in the regularly maintained fuel breaks and access roads within the Impact Area Munitions Response Area (MRA), as described in the Final *Track 3 Record of Decision, Impact Area Munitions Response Area, Track 3 Munitions Response Site, Former Fort Ord, California* [Track 3 ROD] (Army, 2008).

The Impact Area MRA contains approximately 184 acres of fuel breaks that provide wildfire control and operational access within the 6,560-acre habitat reserve. The fuel breaks are generally 45 to 50 feet wide and consist of a central road approximately 15 to 20 feet in width, with 15-foot-wide areas cleared of vegetation on either side of the fuel break road. Based on this configuration, the fuel break system represents approximately 32 miles of linear fuel breaks. These fuel breaks were historically constructed and maintained to mitigate fire risks associated with munitions training activities in the former firing and impact area.

MEC removal activities were completed under U.S. Army Corps of Engineers (USACE) oversight through four distinct efforts conducted between 1997 and 2023, summarized below:

- Effort 1 (1997–2008): Pre-ROD surface and subsurface MEC removal
- Effort 2 (2008–2015): Post-ROD remedial action by Shaw Environmental and ITSI Gilbane
- Effort 3 (2015–2019): Continued MEC removal by KEMRON
- Effort 4 (2018–2020 and 2023): Supplemental subsurface MEC removal using Advanced Geophysical Classification (AGC) conducted by KEMRON.

This RAR was prepared by KEMRON Environmental Services under Contract W9123820D0004, Task Order W9123822F0043. The work was performed in accordance with the governing remedial design and remedial action documents listed below:

- *Final Track 3 Record of Decision, Impact Area Munitions Response Area, Track 3 Munitions Response Site, Former Fort Ord, California* [Track 3 ROD] (Army, 2008)
- *Final Work Plan, Remedial Design/Remedial Action, Track 3 Impact Area Munitions Response Area, Former Fort Ord* [Final RD/RA Work Plan] (USACE, 2009)
- *Remedial Design (RD)/Remedial Action (RA) Work Plan Update, Track 3 Impact Area Munitions Response Area (MRA) Munitions and Explosives of Concern (MEC) Removal, Former Fort Ord, California* [RD/RA WP Update] (KEMRON, 2018)
- *Final, Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* [Non-Burn SSWP] (Shaw, 2010)
- *Site Specific Work Plan Fuel Breaks Supplemental Subsurface Munitions and Explosives of Concern Removal, Impact Area Munitions Response Area Former Fort Ord, California Orion Road and Watkins Gate Road* [Orion Road and Watkins Gate Road SSWP] (KEMRON, 2023a)

Previous MEC removal activities are documented in the following Technical Information Papers (TIPs) included as Appendices A through C:

- Volume 1: *DRAFT FINAL Volume 1, Technical Information Paper Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* [Volume 1 FB TIP] (KEMRON, 2021),
- Volume 2: *FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* [Volume 2 FB TIP] (KEMRON, 2021a), and
- Volume 3: *Volume 3, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* [Volume 3 FB TIP] (KEMRON, 2025).

1.1 Purpose and Scope

The purpose of the RAR is to document the scope, execution, and results of subsurface MEC removal conducted within the permanent fuel breaks of the Impact Area MRA. The report documents the activities performed and the results of those actions in support of the selected remedy.

The Impact Area MRA consists of the 6,560-acre portion of the 8,000-acre historical Impact Area. This area lies entirely within the natural resources management zone established in the Installation-Wide Multispecies Habitat Management Plan for Former Fort Ord, California [HMP] (USACE, 1997) and is currently identified for transfer to the Bureau of Land Management (BLM). The actions documented in this RAR supplement previous work and complete subsurface MEC removal within the designated fuel break system as required by the Track 3 ROD (Army, 2008).

The project scope, as defined in the Non-Burn SSWP (Shaw, 2010), Orion Road and Watkins Gate Road SSWP (KEMRON, 2023a), and approved field work variances (FWVs), included:

- Vegetation clearance to establish access
- Surface MEC removal
- Digital geophysical mapping (DGM)
- Subsurface MEC removal to depth of detection

1.2 Approval Documents

The remedial action activities documented in this RAR were conducted in accordance with the Final RD/RA Work Plan (USACE, 2009) for the Track 3 Impact Area MRA and the Non-Burn SSWP (Shaw, 2010). The Non-Burn SSWP detailed the scope and site-specific procedures for the MEC remedial action within the Impact Area MRA Fuel Break System. Approved FWVs to the Non-Burn SSWP are summarized below.

Approved modifications to the fuel break system and related field procedures are summarized as follows:

- TII-045 (Shaw, 2011): Modified fuel break segments originally included in the Non-Burn

SSWP (Shaw, 2010).

- 03-002 (Innovative Technical Solutions, Inc, 2011): Clarified DGM-related subsurface remediation procedures including anomaly density, data gaps, Special Case Areas, and QC requirements.
- 03-021 (Gilbane, 2015): Removed Evolution Road north of Broadway Avenue from the fuel break network.
- 001 (KEMRON, 2015): Added Hugo Road to the fuel break network.
- 004 (KEMRON, 2016b): Incorporated realignment of Nowhere Road.
- 013 (KEMRON, 2018a): Incorporated realignment of Evolution Road.
- 014 (KEMRON, 2018b): Added/realigned Impossible Canyon Road segments due to erosion.
- 015 (KEMRON, 2018c): Removed Steep Road from the fuel break network.
- 017 (KEMRON, 2018d): Recommended supplemental subsurface removal in 25.5 acres based on QC results and historical 81-mm mortar recoveries. These recommendations were implemented and documented in Volume 2 FB TIP (KEMRON, 2021a) and Volume 3 FB TIP (KEMRON, 2025).

Quality assurance (QA) and quality control (QC) procedures for MEC remedial actions were governed by the *Final Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern* (KEMRON, 2016). This QAPP established project-wide QA/QC requirements applicable to munitions response activities, including data quality objectives, field documentation, personnel qualifications, and inspection and verification procedures to ensure remedial actions were performed in compliance with approved work plans and regulatory requirements.

AGC activities were conducted in accordance with *the Final Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II, Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (KEMRON, 2016a). This document defined QA/QC requirements specific to AGC data acquisition, processing, classification, and validation, and provided the technical basis for ensuring the reliability and defensibility of AGC-supported subsurface MEC removal activities.

In 2023, KEMRON completed the *Quality Assurance Project Plan Superfund Response Action Former Fort Ord Addendum, California Volume II Munitions Response Appendix B Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (KEMRON, 2023) to align AGC activities at Fort Ord with Department of Defense Advanced Geophysical Classification Accreditation Program (DAGCAP) accreditation requirements. AGC work performed prior to implementation of the addendum was reviewed and determined to be valid by USACE and the Fort Ord Base Realignment and Closure (BRAC).

No modifications were required to the Orion Road and Watkins Gate Road SSWP (KEMRON, 2023a). Former fuel break segments removed from the current network are shown on Appendix A Figure 3 and summarized in the Volume 1 FB TIP (KEMRON, 2021).

1.3 Health and Safety

All field activities documented in this RAR were conducted in accordance with the approved health and safety plans and accident prevention plans applicable to each phase of work. These plans established procedures to protect personnel, the public, and the environment during MEC removal activities. Health and safety requirements, site-specific hazards, and protective measures are documented in the applicable work plans and summarized in the associated TIP volumes (Appendices A through C).

1.4 Report Organization

This RAR was prepared in accordance with the Track 3 RD/RA Work Plan (USACE, 2009) and is consistent with previous remedial action reports (RARs) for units within the Impact Area MRA at the former Fort Ord. The report also incorporates elements of U.S. Environmental Protection Agency (EPA) guidance for an RAR. Sections of this RAR are organized as follows:

Section 1.0 Introduction
Section 2.0 Site Background
Section 3.0 Overview of Remedial Action
Section 4.0 Quality Control/Quality Assurance
Section 5.0 Environmental Protection
Section 6.0 Protectiveness Assessment
Section 7.0 References

The supplemental subsurface MEC removal with AGC is reported in Appendices B and C, which include Volume 2 FB TIP (KEMRON, 2021a) and Volume 3 FB TIP (KEMRON, 2025).

1.5 Applicable or Relevant and Appropriate Requirements

Applicable or relevant and appropriate requirements (ARARs) for the Impact Area MRA were established in the Track 3 ROD (Army, 2008). All remedial action activities documented in this RAR were performed in compliance with the ARARs identified in that decision document.

2.0 Site Background

The former Fort Ord consists of approximately 46 square miles of land located in northwestern Monterey County, California. The Impact Area MRA consists of the 6,560-acre portion of the 8,000-acre historical Impact Area. This area lies entirely within the natural resources management zone established in the HMP (USACE, 1997) and is currently identified for transfer to the BLM.

2.1 Population, Proximity, and Access

The Impact Area MRA is enclosed by a four-strand barbed wire fence with concertina wire installed at critical locations. Access is restricted to authorized personnel only, and "No Trespassing" warning signs are posted along the perimeter at intervals of 91 meters (300 feet) or

less. Personnel from the BRAC Office and the BLM routinely inspect and maintain the perimeter fencing under a services support agreement.

Although access deterrents discourage entry, unauthorized access through intentional trespassing remains a potential exposure pathway. To address access control and site security the Army implements the Munitions Response Site (MRS) Security Program, as documented in the *Munitions Response Site (MRS) Security Program Former Fort Ord, California* (Army, 2020).

2.2 Reuse

The Impact Area MRA is designated for transfer to the BLM for use as a habitat reserve in accordance with the HMP (USACE, 1997), which establishes land-use restrictions and habitat management requirements to protect special-status plant and animal species. Anticipated reuse activities within the habitat reserve include:

- Road and trail management and maintenance
- Habitat enhancement, including prescribed burning
- Fuel break management
- Administrative area use
- Habitat monitoring and educational programs
- Species-specific monitoring and habitat enhancement
- Recreational access on established routes

2.3 Regulatory Status

Fort Ord was placed on the National Priorities List (NPL) of Superfund sites by the EPA on February 21, 1990, due to evidence of contaminated soil and groundwater. A Federal Facility Agreement (FFA) was signed by the Army, EPA, Department of Toxic Substances Control (DTSC), and the Regional Water Quality Control Board, a part of the California EPA. The FFA established procedures and schedules for conducting remedial investigations (RIs) and feasibility studies (FSs) and requires remedial actions be completed as expeditiously as possible. The former Fort Ord was selected in 1991 for BRAC, and the base was officially closed in September 1994. The Army began investigating and removing MEC at the former Fort Ord after the BRAC listing and a munitions response RI/FS began in 1998. In April 2000, an agreement was signed between the Army, EPA, and DTSC to evaluate MEC at the former Fort Ord subject to the provisions of the FFA.

Following completion of the *Final Track 3 Impact Area Munitions Response Area Munitions Response Remedial Investigation/Feasibility Study Former Fort Ord, California* (MACTEC Engineering and Environmental Services [MACTEC], 2007), the Army prepared the Track 3 ROD (Army, 2008), which is the decision document presenting the selected remedial action for MEC in the Impact Area MRA. The remedy was selected following a 60-day public comment period that ended on August 27, 2007, for the *Superfund Proposed Plan Remedial Action is Proposed for Impact Area Munitions Response Area, Track 3 Munitions Response Remedial Investigation/Feasibility Study, Former Fort Ord, California* (Army, 2007). The remedy was selected in accordance with the Comprehensive Environmental Response, Compensation, and

Liability Act of 1980 (CERCLA), as amended by the Superfund Amendments and Reauthorization Act of 1986, and, to the extent practicable, the National Oil and Hazardous Substances Pollution Contingency Plan.

The decision documented in the Track 3 ROD (Army, 2008) is undertaken pursuant to the President's authority under CERCLA Section 104, as delegated to the Army in accordance with Executive Order 12580, and in compliance with the process set out in CERCLA Section 120. The selection of the remedy is authorized pursuant to CERCLA Section 104, and the selected remedy is being carried out in accordance with CERCLA Section 121. The Army and the EPA jointly selected the remedy. The California EPA, as represented by the DTSC, had an opportunity to review and comment on the Track 3 ROD (Army, 2008).

2.4 Site Features and History of Military Munitions Use

Since 1917 until base closure in 1994, portions of former Fort Ord were used by cavalry, field artillery, and infantry units for maneuvers, target ranges, and other purposes. Military munitions were fired and used on the facility, including artillery and mortar projectiles, rockets and guided missiles, rifle and hand grenades, practice land mines, pyrotechnics, bombs, and demolition materials.

The Impact Area MRA is a complex of numerous former military ranges with a variety of historical uses, designs, and characteristics. Select ranges were used for small arms training activities only, while other ranges are characterized as multi-use. In general, the firing points of the ranges were located near the perimeter of the MRA, and firing was directed toward the interior portion of the range complex. Training activities at the Impact Area MRA ceased after the closure of Fort Ord in 1994. The Impact Area MRA is fenced, warning signs are posted, and access is controlled by the Army. The perimeter of the Impact Area MRA is patrolled to detect and prevent trespassing.

2.5 History of the Establishment of the Fuel Break System

The Impact Area MRA includes a system of permanent fuel breaks that also serve as access roads throughout the interior of the MRA, as shown on Figure 2. The Impact Area MRA permanent fuel break system is based primarily on pre-existing Army fuel breaks designed to contain fires in the dense maritime chaparral caused by military training involving explosive weapons and ordnance.

Following base closure, many of the original roads that served as fuel breaks in the historical impact area had become overgrown with vegetation and restricted by poor access. To reduce the threat posed by potential wildfires and to optimize access and fire suppression capabilities, the Army reestablished the fuel break system within the historical impact area beginning in 2001. The fuel breaks were designed to be 45 to 50 feet wide and consist of a central road of 15 to 20-foot width, with 15-foot-wide areas cleared of vegetation on either side of the fuel break road. Fuel breaks were divided into approximately 100-foot-long grids to support establishment, maintenance, and tracking.

2.6 Summary of MEC-Related Activities Prior to Remedial Action

Prior to issuance of the Track 3 ROD (Army, 2008), MEC removal activities were conducted within the fuel break network by CMS Environmental, Inc. (later USA Environmental, Inc.) and Parsons under approved work plans. Initial MEC removal operations occurred in 1997 and 1998 to support safe access, MEC sampling, and wildfire management.

Between 2001 and 2005, the fuel break system was reestablished in three phases, including vegetation removal, surface MEC removal, and subsurface MEC removal to a depth of 4 feet along central roads and adjacent corridors. During Phases 1 and 2, all detected anomalies were excavated and removed. During Phase 3, detected anomalies were excavated until encountering the source or reaching the specified depth of 4 feet. If a team reached that depth without finding the anomaly source, the team consulted with a USACE representative about whether to proceed with further excavation. Records indicated that subsurface investigations stopped at a depth of 4 feet in one grid, Riso Ridge E096 (current grid ID RI096). This grid was later included in a soil remediation excavation under the Site 39 soil remediation program. After the soil excavation, subsurface removal to a depth of 4 feet was conducted in the excavation area, and all detected anomalies were intrusively investigated or resolved. These activities are documented in multiple after-action reports, and the information was incorporated into the *Track 3 RI/FS* (MACTEC, 2007).

Additional site background information is provided in the Volume 1 FB TIP (KEMRON, 2021).

2.7 Broadway Bypass Fuel Break

The Broadway Bypass fuel break is located within MRS Ranges 43–48 South and connects Broadway Avenue to Felix Road, providing an access route that bypasses the heavily eroded portion of Broadway Avenue west of the Orion Road intersection. Surface and subsurface MEC removal activities within the Broadway Bypass grids had been conducted as part of an Interim Remedial Action for MRS Ranges 43–48 South and the information was incorporated into the *Track 3 RI/FS* (MACTEC, 2007).

As described in the *Final, Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Broadway Bypass, Former Fort Ord, California* (KEMRON, 2017), AGC was selected as the subsurface DGM method. The AGC process included a comprehensive dynamic DGM survey using the Time-Domain Electromagnetic MTADS MP 2x2 (TEMTADS) advanced electromagnetic induction sensor, followed by a static TEMTADS classification survey.

Completion of MEC removal activities within the Broadway Bypass fuel break was documented separately in the *Remedial Action Report, Track 3 Impact Area MRA, Broadway Bypass, Former Fort Ord, California* (KEMRON, 2019). Data associated with the Broadway Bypass are included in Tab 3 of the Volume 1 FB TIP (KEMRON, 2021) for completeness but are not further discussed in this RAR.

3.0 Overview of Remedial Action

As part of the RA for the Impact Area MRA, subsurface MEC removal has been completed within the permanent fuel break system. RA implementation occurred in multiple phases, including removal actions prior to the ROD, continuing with the work under the Non-Burn SSWP (Shaw, 2010) and associated FWVs, and concluding with supplemental subsurface MEC removal and final intrusive investigations completed in 2023. Over this time, road and fuel break maintenance activities involving ground-disturbing activities were conducted with support from UXO-qualified personnel, as appropriate. Incidental munitions encounters are managed and reported under the Army's MRS Security Program, as described in the *Munitions Response Site (MRS) Security Program Former Fort Ord, California* (Army, 2020).

3.1 Remedial Action Objectives

The remedial action objective (RAO) for the Track 3 remedy is to protect human health and the environment in a manner that complies with the ARARs. The RAO will be achieved by implementing the selected remedy of Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas and Land Use Controls (LUCs). The selected remedy is designed to achieve both substantial risk reduction through MEC remediation and risk management through implementation of LUCs. The selected remedy best balances the risk reduction and associated environmental impacts in supporting the anticipated future use of the site as a habitat reserve. The presence of MEC in the Impact Area MRA was not identified as a concern in terms of explosives safety risks to ecological receptors. The network of fuel breaks within the Impact Area MRA was specified in the Track 3 ROD as a subsurface removal area.

Further statements regarding the RAOs are provided in the Final RD/RA Work Plan (USACE, 2009):

- "The selected remedy addresses current or potential explosives safety risks to human health and the environment from MEC within the Impact Area MRA."
- "The most significant short-term objective is to remove surface MEC and prevent public access until MEC removal is completed."
- "The long-term objective is to make the property safe for required habitat management activities by supplementing the remedial action with appropriate institutional controls … that will effectively manage risk from any potentially residual MEC after the remedial action is completed."

The Track 3 remedy includes the following components:

- Vegetation clearance to provide access for MEC remediation.
- Technology-aided surface MEC removal.
- DGM to document subsurface anomalies and support future land-use decisions.
- Subsurface MEC removal in selected areas, including regularly maintained fuel breaks and access roads.
- Implementation of LUCs, including MEC recognition and safety training, access controls, construction support for ground-disturbing or intrusive activities, UXO-qualified personnel support, maintenance of fencing and signage, and property transfer

documentation establishing land-use restrictions.

This RAR addresses the subsurface MEC removal conducted within the regularly maintained fuel break system.

3.2 MEC Remedial Action

Section 3.2 summarizes the implementation of the MEC remedial action within the permanent fuel break system, including the sequence of remedial efforts, variations from the site-specific work plan, and cumulative MEC results.

3.2.1 MEC Remedial Action Chronology

MEC removal activities within the permanent fuel break system were completed under USACE oversight through four distinct efforts conducted between 1997 and 2023. A chronology of the major remedial action phases implemented within the permanent fuel break system is provided in Table 1.

3.2.2 Variations from the Site-Specific Work Plan

Variations from the planned methods and areas outlined in the Final RD/RA Work Plan (USACE, 2009) and the Non-Burn SSWP (Shaw, 2010) were implemented in response to unanticipated site conditions and to enhance the efficiency of MEC remedial actions.

The current Impact Area MRA fuel break system consists of approximately 184 acres (Figure 2). Modifications from prior alignments include:

Removed or Excluded Fuel Breaks

- Broadway Avenue (formerly Pipeline Road) fuel break between Broadway Bypass and Orion Road
- South Boundary Road fuel break adjacent to Units 4 and 5A
- Evolution Road fuel break north of Broadway Avenue
- Steep Road

Removed or excluded fuel break segments received surface and/or subsurface MEC removal depending on site conditions and location.

Added Fuel Breaks

- Impossible Canyon Road (north of Hawkeye Road and south of Steep Road)
- Oscar Road northeast of Felix Road
- Felix Road northwest of Broadway Bypass
- Hugo Road between Units 9 and 31

Realigned Fuel Breaks

- Evolution Road between Units 6 and 4
- Nowhere Road between Units 7 and 10 (to avoid erosion-prone areas)

- Chinook Road between Units 15 and 21 (to align with roadway)
- Portions of Impossible Canyon Road between Units 28 and 20 (to avoid flooding-prone areas)
- Northern end of Orion Road at the intersection of Eucalyptus Road

Subsurface MEC removal was completed within the previous alignments of the realigned fuel break segments (shown in Figure 2) as part of the remedial action.

3.2.3 Summary of Remedial Action Methods

Subsurface MEC removal within the fuel break system was conducted under U.S. Army Corps of Engineers oversight between 1997 and 2023. Work included pre-ROD removal actions, remedial actions performed in accordance with the Final RD/RA Work Plan (USACE, 2009) and applicable SSWPs, and supplemental subsurface MEC removal documented in the Volume 2 FB TIP (KEMRON, 2021a) and Volume 3 FB TIP (KEMRON, 2025). All subsurface MEC removal activities were implemented within designated fuel break corridors in accordance with approved work plans and established field procedures.

Subsurface removal activities were completed across fuel break segments to the depth of detection to support the Track 3 remedy. The Non-Burn SSWP (Shaw, 2010) provided the following process for subsurface investigation: “All subsurface removals will be to the depth of detection of each particular instrument, with the caveat that any anomaly investigation below four feet in depth will be approved by the USACE OE Safety Specialist and USACE PM [Project Manager] prior to investigation. All anomaly investigations that are not resolved after reaching 4 feet in depth will be referred to the USACE OE Safety Specialist and USACE PM.” The depth provision for consultation with USACE is an element of task and cost control for the cost-reimbursement contract. It is not meant to allow incomplete investigation of subsurface anomalies when subsurface removal to the depth of detection is intended. Based on the MMRP database, no detected anomaly was left unresolved after reaching a 4-ft depth in excavation. Excavation and removal were conducted within designated work limits, including areas containing existing infrastructure features. Features such as culverts, fence posts, and other site elements were left in place when necessary to maintain access and site integrity, and subsurface MEC removal was completed within the established fuel break corridors.

DGM data within previously cleared areas were subject to QC/QA review in accordance with the Final SSWP (Shaw, 2010). Based on anomaly density and historical MEC recovery patterns, supplemental subsurface MEC removal was conducted within approximately 25.5 acres of the fuel break system, as documented in Volume 2 FB TIP (KEMRON, 2021a) and Volume 3 FB TIP (KEMRON, 2025).

Based on input from the BLM, white PVC markers were installed to delineate the limits of subsurface MEC removal along fuel break corridors. Blue PVC markers were installed to identify locations where existing obstacles, integral to access and site management, were not removed to facilitate completion of subsurface removal activities.

Tables 2 and 3 summarize MEC items recovered and removed by fuel break grid, including segment totals and overall quantities and locations, while Figures 4 through 11 present spatial distributions across the fuel breaks within the Impact Area MRA. Additional details regarding site-specific conditions and supplemental subsurface MEC removal are provided in Sections 3.2.3.1 through 3.2.3.18. The recovered MEC items are identified by their final classification as Unexploded Ordnance (UXO), Discarded Military Munitions (DMM), or Insufficient Data (ISD). The ISD classification is used for historical items that could not be conclusively identified or classified based on their condition or the available information at the time of investigation.

3.2.3.1 Austin Road

Austin Road is located in the western portion of the Impact Area MRA at the former Fort Ord. MEC remediation was conducted between 2001 and 2017 using both analog and digital geophysical detection methods. Across all phases, nine MEC items (two DMM and seven UXO) were identified and removed. Remediation activities were performed under separate contracts by Parsons (2001–2005), Gilbane (2011–2014), and KEMRON (2017).

A central portion (approximately 15 feet wide) of Austin Road contains varying levels of asphalt through which subsurface anomalies were not investigated. Culverts remain in place on Austin Road and are delineated in the field using blue PVC markers. The selected remedy includes a requirement for construction support for ground-disturbing activities. MEC remediation within Austin Road is complete.

3.2.3.2 Broadway Avenue

Broadway Avenue (formerly Pipeline Road) is located in the northern portion of the Impact Area MRA. MEC remediation occurred from 1997 through 2015 using analog and digital detection methods. A total of 84 MEC items, all UXO, were removed. Work was performed under separate contracts by USA Environmental (1997–1998), Parsons (2001), and Gilbane (2012–2015). A surface removal was also conducted following a 2003 fire in the Watkins Gate Burn Area.

A steep, erosion-prone segment between Broadway Bypass and Felix Road was abandoned as a functional fuel break. Subsurface anomalies in that segment were investigated and removed prior to establishing Broadway Bypass and Felix Road as replacement fuel breaks. MEC remediation within Broadway Avenue is complete.

3.2.3.3 Broadway Bypass

Broadway Bypass is located in the northern portion of the Impact Area MRA. MEC remediation occurred from 2004 through 2018 using both analog and digital detection. A total of 22 MEC items, all UXO, were removed. Parsons performed early removal activities under the Interim Remedial Action for Ranges 43–48 South, followed by additional work by Gilbane (2014) and KEMRON (2017–2018).

Broadway Bypass was established in response to an erosion-prone slope on Broadway Avenue that rendered a portion of the original fuel break unusable. MEC remediation within Broadway Bypass is complete, and it remains the designated fuel break for this area.

3.2.3.4 Chinook Road

Chinook Road is located in the northeastern portion of the Impact Area MRA. MEC remediation occurred from 2001 through 2017 using analog and digital methods. Three MEC items, all UXO, were removed. Work was conducted by Parsons (2001–2005), Gilbane (2011–2014), and KEMRON (2016–2017).

The intersection of Chinook Road and Watkins Gate Road was used as a staging point for targets and other range-related debris during active training and munitions response activities. Debris removed from other areas within the Impact Area MRA was temporarily staged at this location prior to off-site disposal or recycling. Due to the presence of significant metallic debris in the subsurface, MEC remediation near the intersection of Chinook Road and Watkins Gate Road was conducted using analog methods. MEC remediation within Chinook Road is complete.

3.2.3.5 Darwin Road

Darwin Road is located in the southern portion of the Impact Area MRA. MEC remediation occurred from 2001 through 2014 using analog and digital methods. Three MEC items, all UXO, were removed. Parsons (2001–2005) and Gilbane (2011–2014) performed removal activities under separate contracts.

No areas of special note were identified. MEC remediation within Darwin Road is complete.

3.2.3.6 Evolution Road

Evolution Road (formerly Maverick Road) is located in the western portion of the Impact Area MRA. MEC remediation occurred from 1997 through 2017 using analog and digital methods. A total of 56 MEC items, all UXO, were removed. Work was performed by USA Environmental (1997–1998), Parsons (2001–2005), Gilbane (2011–2014), and KEMRON (2017).

The northern segment north of Broadway Avenue was abandoned as a viable fuel break for long-term maintenance. Subsurface anomalies within this portion of Evolution Road were investigated and removed. Broadway Bypass, Felix Road, and Oscar Road were established as replacement fuel breaks. In the southern segment, the alignment was rerouted, and anomalies along both alignments were investigated and removed. MEC remediation within Evolution Road is complete.

3.2.3.7 Felix Road

Felix Road is located in the northern portion of the Impact Area MRA. MEC remediation occurred from 1997 through 2017 using analog and digital detection methods. A total of 221 MEC items

(one DMM, four ISD, and 216 UXO) were removed. Work was completed by USA Environmental (1997), Parsons (Interim Remedial Action for Ranges 43–48 South), and KEMRON (2017).

Felix Road was established as a fuel break to replace an eroded and impassable segment of Broadway Avenue. MEC remediation within Felix Road is complete.

3.2.3.8 Hawkeye Road

Hawkeye Road is located in the eastern portion of the Impact Area MRA. MEC remediation occurred from 2001 through 2020 using analog and digital methods. A total of 85 MEC items, all UXO, were removed by Parsons (2001), Gilbane (2012–2013), and KEMRON (2018 and 2020).

Nine grids (0.99 acres) were included in the supplemental subsurface MEC removal, as described in Volume 2 FB TIP (KEMRON, 2021a). One UXO item recovered during this supplemental work is included in the 85 MEC items reported above. MEC remediation within Hawkeye Road is complete.

3.2.3.9 Hugo Road

Hugo Road is located in the southeastern portion of the Impact Area MRA. MEC remediation occurred from 2015 through 2016 using analog and digital methods. Three MEC items, all UXO, were removed by KEMRON.

The western section of Hugo Road near intersection with Orion Road contains a portion of asphalt, previously used as a helicopter base during prescribed burn operations, through which subsurface anomalies were not investigated. The selected remedy includes a requirement for construction support for ground-disturbing activities. MEC remediation within Hugo Road is complete.

3.2.3.10 Impossible Canyon Road

Impossible Canyon Road is located in the eastern portion of the Impact Area MRA. MEC remediation occurred from 2001 through 2020 using analog and digital methods. A total of 42 MEC items (40 UXO and two DMM) were removed by Parsons (2001), Gilbane (2012), and KEMRON (2018 and 2020).

Fourteen grids (1.17 acres) were included in the supplemental subsurface MEC removal, as described in Volume 2 FB TIP (KEMRON, 2021a), and no additional MEC was recovered. The central portion of Impossible Canyon Road between Units 20 and 28 was rerouted to avoid an area subject to frequent seasonal erosion associated with an ephemeral stream. The realignment was constructed as a drivable road with on-call construction support in 2025, and no MEC was recovered during this effort. Culverts remain in place on Impossible Canyon Road and are delineated in the field using blue PVC markers. The selected remedy includes a requirement for construction support for ground-disturbing activities. MEC remediation within Impossible Canyon Road is complete.

3.2.3.11 Mercury Road

Mercury Road is located in the southeastern portion of the Impact Area MRA. MEC remediation occurred from 1997 through 2020 using analog and digital methods. A total of 233 MEC items (231 UXO and two DMM) were removed by USA Environmental (1997), Parsons (2001–2005), Gilbane (2012–2014), and KEMRON (2018 and 2020).

Twenty-one grids (2.40 acres) were included in the supplemental subsurface MEC removal as described in Volume 2 FB TIP (KEMRON, 2021a), during which 13 MEC items (12 UXO and one DMM) were recovered and are included in the total of 233 MEC items reported above. MEC remediation within Mercury Road is complete.

3.2.3.12 Nowhere Road

Nowhere Road is located in the western portion of the Impact Area MRA. MEC remediation occurred from 1997 through 2020 using analog and digital methods. A total of 30 MEC items, all UXO, were removed by USA Environmental (1997), Parsons (2001), Gilbane (2011–2014), and KEMRON (2016–2020).

Forty grids (4.39 acres) were included in the supplemental subsurface MEC removal as described in Volume 2 FB TIP (KEMRON, 2021a). One UXO item was recovered during this supplemental effort and is included in the total MEC count reported above. A central segment in Unit 10 was rerouted to avoid seasonal flooding. MEC remediation within Nowhere Road is complete.

3.2.3.13 Orion Road

Orion Road is located in the central portion of the Impact Area MRA. MEC remediation occurred from 1997 through 2023 using analog and digital methods. A total of 154 MEC items (152 UXO and two DMM) were removed by USA Environmental (1997), Parsons (2001–2005), Shaw (2009–2011), Gilbane (2011–2014), and KEMRON (2018, 2020, and 2023).

Seventy-four grids (8.39 acres) were included in the supplemental subsurface MEC removal as described in Volume 2 FB TIP (KEMRON, 2021a) and Volume 3 FB TIP (KEMRON, 2025), during which 11 UXO items were recovered and included in the total MEC count reported above. The center portion (approximately 15 feet wide) of Orion Road south of Mercury Road contains varying levels of asphalt through which subsurface anomalies were not investigated. The selected remedy includes a requirement for construction support for ground-disturbing activities.

The northern end of the Orion Road fuel break at its intersection with Eucalyptus Road was realigned following completion of MEC removal in Unit 18. The realigned grids (PE063 and PE064) are part of the Range 42 pad area identified for future habitat restoration. As part of the RA in Unit 18, subsurface MEC remediation activities were initiated within the future habitat restoration area. Excavation of 998 of approximately 3,200 DGM anomalies resulted in no MEC being encountered; excavations primarily revealed general debris with minor munitions debris (MD) and range-related debris (RRD). The area was determined to be a low-probability MEC area.

Portions of the area received subsurface removal, while other areas were bulldozed in preparation for restoration activities. During initial habitat restoration, soil ripping to a depth of approximately 18 inches was completed using construction support, and no MEC or MEC-like items were encountered. This work is documented in the *Final MRS-BLM Units 18 and 22, Munitions and Explosives of Concern Remedial Action Report, Former Fort Ord, California* (Shaw, 2011a). MEC remediation within Orion Road is complete.

3.2.3.14 Oscar Road

Oscar Road is located in the northern portion of the Impact Area MRA. MEC remediation occurred from 2003 through 2019 using analog and digital methods. A total of 28 MEC items (26 UXO, one DMM, and one ISD) were removed. Work was performed by Parsons (2003-2005) and KEMRON (2019).

In 2019, KEMRON completed additional analog subsurface removal in five partial grids to establish a continuous 45-foot-wide subsurface removal corridor. No MEC items were recovered during the 2019 KEMRON subsurface removal activities. MEC remediation within Oscar Road is complete.

3.2.3.15 Phoenix Road

Phoenix Road is located in the western portion of the Impact Area MRA. MEC remediation occurred from 1997 through 2014 using analog and digital methods. Five MEC items, all UXO, were removed by USA Environmental (1997), Parsons (2001–2005), and Gilbane (2014).

No areas of special note were identified. MEC remediation within Phoenix Road is complete.

3.2.3.16 Riso Ridge Road

Riso Ridge Road is located in the eastern portion of the Impact Area MRA. MEC remediation occurred from 2000 through 2020 using analog and digital methods. A total of 113 MEC items (112 UXO and one DMM) were removed by Parsons (2001–2005), Shaw (2010), Gilbane (2012–2014), and KEMRON (2017–2020).

Thirty-eight grids (3.92 acres) were included in the supplemental subsurface MEC removal as described in Volume 2 FB TIP (KEMRON, 2021a), during which 12 UXO items were recovered and are included in the total MEC count reported above. MEC remediation within Riso Ridge is complete.

3.2.3.17 Watkins Gate Road

Watkins Gate Road is located in the central portion of the Impact Area MRA. MEC remediation occurred from 1997 through 2023 using analog and digital methods. A total of 31 MEC items (28 UXO and three DMM) were removed by USA Environmental (1997–1998), Parsons (2001–2005), and KEMRON (2017–2019 and 2023).

Forty-one grids (4.23 acres) were included in the supplemental subsurface MEC removal as described in Volume 2 FB TIP (KEMRON, 2021a) and Volume 3 FB TIP (KEMRON, 2025), during which four UXO items were recovered and are included in the total MEC count reported above. MEC remediation within Watkins Gate Road is complete.

3.2.3.18 Wildcat Ridge Road

Wildcat Ridge Road is located in the eastern portion of the Impact Area MRA. MEC remediation occurred from 2001 through 2019 using analog and digital methods. Eight MEC items (four UXO and four DMM) were removed by Parsons (2001), Gilbane (2012–2013), and KEMRON (2018–2019).

No areas of special note were identified. MEC remediation within Wildcat Ridge is complete.

4.0 Quality Control/Quality Assurance

QC and QA measures were implemented throughout the RA to ensure that all analog and geophysical activities met project performance standards. QC was conducted by the Contractor (i.e., the prime contractor) through oversight of field operations, blind seed placement, confirmatory analog surveys, 100-percent review of field documentation, and daily evaluation of DGM and AGC data. All analog QC surveys were passed, and all blind seeds were successfully recovered.

The Final SSWP (Shaw, 2010) noted that in areas where removal to depth was previously conducted, DGM data would undergo the QC/QA process. Anomaly reacquisition and intrusive investigation was not anticipated but could have been conducted as part of the QC/QA process. Based on DGM data collected by Shaw, FWV 03-002 (Innovative Technical Solutions, Inc, 2011) noted that ten percent of the anomalies in those previous analog removal areas would be identified for intrusive investigation. This supplemental QC investigation was reported in *Technical Information Paper, Supplemental Quality Control Investigation, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California* attached to FWV 017 (KEMRON, 2018d). Based on this work, a determination was made that portions of the Impact Area MRA fuel break system where MEC and MEC-like MD items were most likely to remain following subsurface removal correlated to the parts of the Impact Area MRA where 81-millimeter (mm) mortars were previously recovered, and where the pre-subsurface removal anomaly density was highest. Supplemental subsurface removal was recommended in 25.5 acres of the Impact Area MRA fuel breaks to address the possibility of MEC items remaining in these areas. Details of the supplemental subsurface MEC removal are presented in Volume 2 FB TIP (KEMRON, 2021a) and Volume 3 FB TIP (KEMRON, 2025).

The QC Geophysicist reviewed all geophysical data in accordance with project quality documents, and any data issues identified during review were resolved prior to final acceptance.

QA was conducted independently by USACE through seed placement, confirmatory analog surveys covering at least 10 percent of removal grids, validation seed placement in AGC areas, and 3–5 percent Electromagnetic 61 (EM61) re-mapping of DGM areas. All data and field results met the established QA criteria. Formal QA documentation is provided in:

- Volume 1 FB TIP (Appendix A): Section 8.0 Quality Control/Quality Assurance
- Volume 2 FB TIP (Appendix B): Section 4.0 Quality Control and Section 5.0 Data Verification and Validation
- Volume 3 FB TIP (Appendix C): Section 4.0 Quality Control and Section 5.0 Data Verification and Validation

5.0 Environmental Protection

The project area is located within the Natural Resource Management Area, designated for transfer to BLM as undeveloped habitat reserve under the HMP (USACE, 1997). These habitat reserves support special-status wildlife species identified in the HMP, and require mitigation and conservation measures identified in the HMP and the PBO.

Over time, multiple Biological Opinions (BOs) have been issued by the U.S. Fish and Wildlife Service (USFWS) following consultation with the Army. In 2015, the USFWS issued a Programmatic BO that superseded previous BOs (USFWS, 2015), followed by a reinitiated Programmatic BO issued on June 7, 2017 (USFWS, 2017), which added further conservation measures related to environmental remediation at former Fort Ord cleanup sites.

Although the project area is within the Natural Resource Management Area, the HMP (USACE, 1997) allows development-oriented uses on up to 2% of this area; the fuel breaks fall within this allowance. Conservation measures are not required within this 2%; however, because work could indirectly affect adjacent habitat reserves, environmental protection measures were implemented. These included:

- All workers received natural resource protection training prior to starting work.
- Habitat Checklists identified avoidance and minimization measures, reviewed and approved by the BRAC Biologist and QC Manager, and briefed to field staff during preparatory meetings.
- Work areas were minimized and confined to the fuel breaks; activities were prohibited in adjacent habitat reserves.
- Refueling occurred only within fuel breaks or on approved main roads, with spill control materials on hand; refueling within 100 feet of vernal ponds was prohibited.
- Off-site equipment was pressure-washed before entering the area to prevent invasive plant spread.
- Mowing was limited to approximately six inches, avoiding soil disturbance.
- Erosion controls were implemented as needed, including mulch/straw placement, re-contouring, and water bars.
- Coast live oak trees greater than four inches diameter were not removed;

selective limbing up to six or eight feet was permitted to reduce fuels and improve access.

- Standard encounter protocols for California tiger salamander (Ambystoma californiense) and black legless lizard (Anniella pulchra nigra) were followed.
- Open excavations six inches or deeper left overnight were covered or ramped to prevent wildlife entrapment.
- Protection measures for sensitive HMP (USACE, 1997) plant species included avoidance, topsoil preservation, and transplantation where necessary.

6.0 Protectiveness Assessment

The protectiveness of the RA was evaluated against the requirements of the Track 3 ROD (Army, 2008). The RA performed in the fuel breaks was consistent with the Final SSWP (Shaw, 2010), Orion and Watkins Gate Road SSWP (KEMRON, 2023a), Final RD/RA Work Plan (USACE, 2009), RD/RA WP Update (KEMRON, 2018) and no conditions contrary to these documents were encountered.

The MEC RA for the project area is complete, and all subsurface MEC remediation areas passed QC/QA. The three phases of the fuel break reestablishment work were conducted within the confines of the approved work plans and subjected to QC and QA inspections and approval. Post-ROD remedial actions were based on the Non-Burn SSWP (Shaw, 2010) and Final Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern (KEMRON, 2016). All analog QC surveys were passed, and all blind seeds were successfully recovered. All data and field results met the established QA criteria. The 25.5 acres of supplemental subsurface MEC removal in the Impact Area MRA Fuel Breaks is complete. The supplemental subsurface removal was completed based on the Non-Burn SSWP (Shaw, 2010), the Orion Road and Watkins Gate Road SSWP (KEMRON, 2023a), and Final Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II, Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan (KEMRON, 2016a). No targets of interest were recovered from the verification and validation investigations.

White PVC markers indicate completion of subsurface MEC removal within the fuel break footprint. Blue PVC markers indicate areas where subsurface MEC removal was not completed due to electromagnetic interference from existing infrastructure such as culverts. Placement of blue markers was coordinated with BLM. The selected remedy includes a requirement for construction support for ground-disturbing activities.

Subsurface MEC removal was not completed in asphalt sections along portions of Austin Road, Hugo Road, and Orion Road. These areas are shown in the appropriate Tabs. Portions of Austin, Hugo and Orion Roads were not excavated at the direction of the USACE. Subsurface MEC removal was also not completed in asphalt areas beneath perimeter gates providing access to

the Impact Area MRA. The Non-Burn SSWP (Shaw, 2010) defined the system of permanent fuel breaks on which 45-foot wide subsurface removal would be completed (excluding paved sections) as part of the remedial action. Table 4 summarizes the remedial action within each fuel break segment, including the areas where subsurface MEC removal was not completed.

Based on the Track 3 ROD (Army, 2008), Final RD/RA Work Plan (USACE, 2009), and RD/RA WP Update (KEMRON, 2018) the following actions will continue until all remedial activities within the Track 3 Impact Area MRA are complete:

- Annual inspection of surface removal areas until the site is stabilized
- Site security of the Impact Area MRA
- Prohibition of unauthorized public access to or within the Impact Area MRA
- MEC recognition and safety training, as needed
- Provision of UXO-qualified personnel support for intrusive work
- Follow-up habitat monitoring

At the completion of the remedial action within the Impact Area MRA, the Army will evaluate the work completed against planned reuse activities and the suitability of the LUCs that were selected as part of the remedy. The results of this evaluation will be included in a Remedial Action Completion Report. A detailed LUC implementation plan will also be developed prior to property transfer, in coordination with the future landowner and the regulatory agencies.

Table 1. Remedial Action Chronology for the Impact Area MRA Fuel Break System

Table 1. Remedial Action Chronology for the Impact Area MRA Fuel Break System				
Effort	**Description**	**Major event**	**Date Started**	**Date Completed**
1	1997-2008: Pre-ROD surface and subsurface MEC removal	Initial MEC removal by USA Environmental (1997–1998) to facilitate safe travel within the historical impact area during MEC sampling activities, prevent the spread of accidental fires and manage controlled burns.	1997	1998
		Reestablishment of the fuel breaks (Phases 1 &2): Parsons conducted surface and subsurface removal to a depth of 4 feet along the central road for vehicle access. Surface removal was conducted within the 15-foot-wide corridors adjacent to the roads.: Phase 1 - 45-ft-wide fuel breaks adjacent to the paved roads around the perimeter of the historical impact area and along several interior roads. Phase 2 - 45-foot-wide fuel breaks along additional interior roads to create manageable polygons. Surface and subsurface removal to a depth of 4 feet along the central road for vehicle access. Surface removal was conducted within the 15-foot-wide corridors adjacent to the roads.	2001	2001
		Reestablishment of the fuel break system Phase 3. Subsurface removal in the 15-foot-wide corridors along each side of nine fuel break central roads, and along the entire 45-foot width of Riso Ridge Road. Portions of Chinook Road and Phoenix Road were reworked with road repair and erosion control.	April 2001	August 2005
		Interim Remedial Action in Munitions Response Site (MRS) – Ranges 43-48. Work included subsurface removal in areas of Oscar Road and Felix Road. Surface and some subsurface removal in the area that will be later identified as Broadway Bypass.	October 2003	December 2005
2	2008-2015: Post-ROD remedial action by Shaw Environmental and ITSI Gilbane	Signature of Track 3 Record of Decision (AR# OE-0647)	NA	May 2008

Table 4. Fuel Break Remedial Action Summary

Fuel Break	Years of MEC Remediation	Detection Methods	Supplemental Subsurface MEC Removal (Grids / Acres; MEC Recovered)	MEC Removed (Total)	Areas Where Subsurface MEC Removal Was Not Completed
Austin Road	2001–2017	Analog and digital	—	9 (7 UXO, 2 DMM)	Central asphalt portion (approximately 15 feet wide); culverts (blue PVC markers)
Broadway Avenue	1997–2015	Analog and digital	—	84 UXO	None
Broadway Bypass	2004–2018	Analog and digital; AGC (Section 2.7)	—	22 UXO	None
Chinook Road	2001–2017	Analog and digital; analog near Watkins Gate Road intersection	—	3 UXO	None
Darwin Road	2001–2014	Analog and digital	—	3 UXO	None
Evolution Road	1997–2017	Analog and digital	—	56 UXO	None
Felix Road	1997–2017	Analog and digital	—	221 (216 UXO, 1 DMM, 4 ISD)	None
Hawkeye Road	2001–2020	Analog and digital; AGC	9 / 0.99; 1 UXO	85 UXO	None
Hugo Road	2015–2016	Analog and digital	—	3 UXO	Asphalt portion previously used as a helicopter base
Impossible Canyon Road	2001–2020	Analog and digital; AGC	14 / 1.17; none	42 (40 UXO, 2 DMM)	Culverts (blue PVC markers)
Mercury Road	1997–2020	Analog and digital; AGC	21 / 2.40; 12 UXO, 1 DMM	233 (231 UXO, 2 DMM)	None
Nowhere Road	1997–2020	Analog and digital; AGC	40 / 4.39; 1 UXO	30 UXO	None
Orion Road	1997–2023	Analog and digital; AGC	74 / 8.39; 11 UXO	154 (152 UXO, 2 DMM)	Center asphalt portion (approximately 15 feet wide) south of Mercury Road
Oscar Road	2003–2019	Analog and digital	—	28 (26 UXO, 1 DMM, 1 ISD)	None
Phoenix Road	1997–2014	Analog and digital	—	5 UXO	None
Riso Ridge Road	2000–2020	Analog and digital; AGC	38 / 3.92; 12 UXO	113 (112 UXO, 1 DMM)	None
Watkins Gate Road	1997–2023	Analog and digital; AGC	41 / 4.23; 4 UXO	31 (28 UXO, 3 DMM)	None
Wildcat Ridge Road	2001–2019	Analog and digital	—	8 (4 UXO, 4 DMM)	None
Total	**1997–2023**	**—**	**237 / 25.5; 41 UXO, 1 DMM**	**1,130 (1,107 UXO, 18 DMM, 5 ISD)**	**—**

Notes:
Subsurface MEC removal was conducted to the depth of detection (Section 3.2.3).
Analog = analog detection (Schonstedt); digital = intrusive investigation of anomalies selected from digital geophysical mapping (DGM) using Electromagnetic 61 (EM61); AGC = Advanced Geophysical Classification.
Subsurface MEC removal was also not completed in asphalt areas beneath perimeter gates providing access to the Impact Area MRA. The selected remedy includes a requirement for construction support for ground-disturbing activities.
Sources: Sections 3.2.3.1 through 3.2.3.18; Table 3; Volume 2 FB TIP (KEMRON, 2021a); Volume 3 FB TIP (KEMRON, 2025).
DMM = Discarded Military Munitions; ISD = Insufficient Data; UXO = Unexploded Ordnance; — = not applicable.

1.0 Introduction

This Technical Information Paper (TIP) describes the work elements and results for the munitions and explosives of concern (MEC) remedial action conducted at the Impact Area Munitions Response Area (MRA) Fuel Breaks (fuel breaks) (Figure 1) at the former Fort Ord, California. The munitions responses conducted within the fuel breaks were performed by various contractors between 1997 and 2020. This TIP is being prepared by KEMRON Environmental Services (KEMRON) with Gilbane as a subcontractor for the United States Army Corps of Engineers (USACE) under the WERS Contract # W91238-20-P-0023.

Munitions responses conducted within the fuel breaks occurred in four separate efforts: 1) Prior to the May 2008 signature of the *Final Record of Decision Impact Area Munitions Response Area Track 3 Munitions Response Site Former Fort Ord, California* (Track 3 Record of Decision [ROD]; United States Department of the Army [Army], 2008); 2) 2008 (post Track 3 ROD signature) – 2015 (Shaw Environmental and ITSI Gilbane prime contractors); 3) 2015 – 2019 (KEMRON prime contractor); and 4) supplemental MEC removal using Advanced Geophysical Classification (AGC) (2018-2020). Specific remedial details for each fuel break are included in the attached Tabs. Details of the supplemental subsurface MEC removal are presented in Volume 2.

The remedial action has been completed in accordance with the:

- Track 3 ROD (Army, 2008),
- *Final Work Plan Remedial Design (RD)/Remedial Action (RA) Track 3 Impact Area Munitions Response Area (MRA) Munitions and Explosives of Concern (MEC) Removal Former Fort Ord, California* (Final RD/RA Work Plan; USACE, 2009), and
- *Final Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* (Final Site-Specific Work Plan [SSWP]; Shaw Environmental, Inc. [Shaw], 2010).

Portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road received supplemental MEC removal. Details of the

supplemental subsurface MEC removal are presented in *Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area, Former Fort Ord, California* (Volume 2). Due to the end of the KEMRON task order at the Former Fort Ord, intrusive investigation of 1,543 targets representing potential TOI (including QC and QA seed items) remains in order to complete the supplemental subsurface MEC removal under a future contract. The remaining intrusive investigations are on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). The remaining intrusive investigation locations are identified in Volume 2.

1.1 Purpose and Scope

This TIP describes the munitions responses conducted in the fuel breaks within the Impact Area MRA. The general scope of the MEC remedial action, as defined in the Track 3 ROD (Army, 2008), is to manage "the potential risk to future land users from MEC at the Impact Area MRA." The network of fuel breaks within the Impact Area MRA was specified in the Track 3 ROD as a subsurface removal area.

Track 3 sites are areas at the former Fort Ord where MEC was known or suspected to be present, but MEC investigations had not yet been completed at the time of the signature of the Track 3 ROD (Army, 2008). The Impact Area MRA consists of the 6,560-acre portion of the 8,000-acre historical Impact Area that is entirely within the natural resources management area described in the *Installation-Wide Multispecies Habitat Management Plan for Former Fort Ord, California* (HMP; USACE, 1997) and is currently identified for transfer to the Bureau of Land Management (BLM).

The Impact Area MRA is designated as a habitat reserve in the Fort Ord Reuse Authority Base Reuse Plan. The 6,560-acre Impact Area MRA at former Fort Ord includes 184 acres of fuel breaks that also serve as access roads throughout the interior of the MRA (Figure 2). The current fuel break system is based primarily on pre-existing Army fuel breaks but has evolved as fuel break segments have been added, removed, or realigned due to changing site conditions and anticipated future use. The fuel break system was originally developed and maintained by the Army to contain fires in the dense maritime chaparral in the historical impact area caused by military training

involving military munitions. After base closure in 1994, responsibility for mitigating the risk of wildfires was transferred from the Army to the Navy Fire Department at the Naval Post Graduate School. In October 2001, the Ord Military Community Fire Department, which is now known as the Presidio of Monterey Fire Department, assumed fire-protection and fire-suppression responsibilities for the Impact Area MRA and continues to maintain those responsibilities.

The remedial action (post-ROD work) supplements the previous work already conducted in portions of the fuel break system to complete subsurface MEC removal on the system of fuel breaks in aggregate. The scope of this project, as defined in the Final SSWP (Shaw, 2010) and approved field work variances (FWVs), entailed the following:

- Vegetation clearance, if needed,
- Surface MEC removal,
- Digital Geophysical Mapping (DGM) survey, and
- Subsurface MEC removal to depth of detection.

1.2 Approval Documents

The work was conducted in accordance with the Final RD/RA Work Plan (USACE, 2009) governing the Track 3 Impact Area MRA. The Final SSWP (Shaw, 2010) detailed the scope and site-specific procedures for the MEC remedial action within the network of fuel breaks (project area). FWVs to the Final SSWP (Shaw, 2010) are listed below:

- TII-045 (Shaw, 2011b) — Modified portions of the permanent fuel break system originally included in the Final SSWP (Shaw, 2010).
- 03-002 (KEMRON, 2011a) — Clarified specific steps to be taken during subsurface MEC remediation with regard to 1) DGM anomaly density in fuel breaks, 2) Data gaps in DGM, 3) Special Case Areas (from Parsons work), and 4) Quality Control (QC) in fuel breaks.
- 03-021 (Gilbane, 2015) — Removed Evolution Road north of Broadway Avenue from the fuel break network.

- 001 (KEMRON, 2015b) Added Hugo Road to the fuel break network.
- 004 (KEMRON, 2016b) Incorporated realignment of Nowhere Road as part of the fuel break network.
- 013 (KEMRON, 2018a) Incorporated realignment of Evolution Road as part of the fuel break network.
- 014 (KEMRON, 2018b) Incorporated portions of Impossible Canyon Road, and a realignment of a section of Impossible Canyon Road to mitigate erosion concerns, as part of the fuel break network.
- 015 (KEMRON, 2018c) Removed Steep Road from the fuel break network.
- 017 (KEMRON, 2018d) Supplemental QC investigation results indicated that the portions of the Impact Area MRA fuel break system where MEC and MEC-like Munitions Debris (MD) items were most likely to remain correlated to the parts of the Impact Area MRA where 81 millimeter (mm) mortars were previously recovered and where the pre-subsurface removal anomaly density was highest. Additional subsurface removal was recommended in 25.5 acres of the Impact Area MRA fuel break system to address the possibility of MEC items remaining in these areas. The assessment of those segments is complete, and selected anomalies remaining to be intrusively investigated are identified in Volume 2.

Former fuel break segments no longer included as part of the current fuel break network are shown on Figure 3. MEC items removed from these former fuel break sections are included in Table 2.

1.3 Project Personnel and Subcontractors

MEC removal work was performed with appropriately qualified Unexploded Ordnance (UXO) technicians who met or exceeded the requirements of *Technical Paper 18, Minimum Qualifications for Personnel Conducting Munitions and Explosives of Concern Related Activities* (Department of Defense Explosives Safety Board [DDESB], various). The most recent version of the document under which MEC removal work was performed is included in Section 12.0. The key personnel for this project varied depending on the time period and remediation contract that was in effect. The most recent list of key personnel is included below:

- Senior Unexploded Ordnance Supervisor (SUXOS): Brad Olson (KEMRON)
- UXO Quality Control (QC) Specialist (UXOQCS): Bruce McClain (KEMRON)
- UXO Safety Officer: Val Valdez (KEMRON)
- Contractor QC Systems Manager (CQCSM): Chuck Clyde (Gilbane)
- QC Geophysicist: Alex Kostera (NAEVA)
- Project Manager: Steve Crane (KEMRON)
- Deputy Project Manager: Erin Caruso (Gilbane)
- Task Manager: Kevin Siemann (Gilbane)
- Project Geophysicist: Andrew Gascho (Gilbane)

1.4 Health and Safety

Work performed at the site was conducted and completed in accordance with health and safety documents that were applicable for the remediation contract that was in effect. Work most recently performed at the site was conducted and completed in accordance with the *Accident Prevention Plan – Munitions and Explosives of Concern (MEC) Removal and Soil Remediation Project, Former Fort Ord, California* (KEMRON, 2015a).

1.5 Report Organization

This TIP was prepared in accordance with the Track 3 RD/RA Work Plan (USACE, 2009) and is consistent with previous remedial action reports (RARs) for units within the Impact Area MRA at the former Fort Ord. The report also incorporates elements of U.S. Environmental Protection Agency (EPA) guidance for an RAR. Sections of this TIP are organized as follows:

Section 1.0 Introduction
Section 2.0 Site Background
Section 3.0 Overview of Remedial Action
Section 4.0 Site Preparation
Section 5.0 Analog MEC Removal
Section 6.0 Digital Geophysical Mapping
Section 7.0 Digital (DGM and AGC-Based) MEC Removal
Section 8.0 Quality Control/Quality Assurance (QC/QA)
Section 9.0 MEC Removed
Section 10.0 Environmental Protection
Section 11.0 Protectiveness Assessment
Section 12.0 References

The supplemental subsurface MEC removal with AGC is reported in Volume 2.

1.6 Applicable or Relevant and Appropriate Requirements

Applicable or relevant and appropriate requirements (ARARs) were outlined in the Track 3 ROD (Army, 2008). The performance of this remedial action was in compliance with the ARARs outlined in that document.

2.0 Site Background

2.1 Site Background

Fort Ord is a former military installation that comprises approximately 46 square miles in northwestern Monterey County, California and is located approximately 120 miles south of San Francisco. Monterey Bay forms the western boundary of the former Fort Ord, and the Santa Lucia Range bounds the former Fort Ord to the south. The cities of Marina, Seaside, and Salinas are northwest, southwest, and east of the former Fort Ord, respectively. Figure 1 shows the location of the project area in the Impact Area MRA.

2.2 Population, Proximity, and Access

The project area is within the Impact Area MRA, which is currently enclosed by a four-strand barbed wire fence with concertina wire along critical locations. Access is restricted to authorized personnel only. The project area is located on land that is planned to be transferred to the BLM. Danger signs are posted at the perimeters of the Impact Area MRA. Existing access deterrents, such as fencing posted with warning signs approximately every 500 feet along the fencing, discourage, but do not prevent, entry into the area. Personnel from the Fort Ord Base Realignment and Closure (BRAC) office and BLM routinely check the Impact Area MRA fences to ensure that they remain in good condition and to identify/complete needed repairs in a timely manner. The fences are maintained through a services support agreement with the BLM. Potential exposure to MEC by unauthorized persons could occur through intentional trespassing. A *Munitions Response Site (MRS) Security Program Former Fort Ord, California* (Army, 2016) is currently being implemented by the Army.

2.3 Reuse

The Impact Area MRA is currently designated for transfer to BLM as habitat reserve and development with reserve or restrictions under the HMP (USACE, 1997) which describes special land restrictions and habitat management requirements within habitat reserve areas. Habitat reserve areas support special-status plant and animal species that require implementation of mitigation measures identified in the HMP (USACE, 1997) to ensure compliance with the Endangered Species Act and to minimize potential adverse impacts to listed species during Army cleanup activities. Based on information provided by BLM, the reuse of the area as a habitat reserve is anticipated to include a variety of activities including:

- Road and trail management and maintenance
- Habitat enhancement, including prescribed burning
- Fuel break management
- Use of administrative areas
- Habitat monitoring and educational programs

- Species-specific monitoring and habitat enhancement
- Recreational access on established routes

2.3.1 Vegetation and Habitat Type

Central maritime chaparral (CMC) is the dominant habitat type within the Impact Area MRA. CMC is a dominant habitat type at Fort Ord and is identified as a protected plant community in the HMP (USACE, 1997). Additionally, some areas of grassland and oak woodland are present.

Chapter 3 of the HMP (USACE, 1997) describes mitigation measures that must be implemented during MEC investigation and remediation. In addition to the HMP (USACE, 1997), base closure and reuse activities conducted at the former Fort Ord are required to follow specific protocols approved by the United States Fish and Wildlife Service (USFWS) as detailed in multiple Biological Opinions (BOs) (USFWS, 1997, 1999, 2002, 2005, 2007 [amendment], 2011, and 2014). In 2015, the USFWS issued a Programmatic BO that supersedes the previous BOs. The *Programmatic Biological Opinion for Cleanup and Property Transfer Actions Conducted at the Former Fort Ord, Monterey County, California* (Programmatic BO; USFWS, 2015) contains additional conservation measures and recommendations relating to environmental remediation at former Fort Ord cleanup sites. In 2017, a new Programmatic BO was issued. The *Programmatic Biological Opinion* (USFWS, 2017) contains additional conservation measures and recommendations relating to environmental remediation at former Fort Ord cleanup sites. Habitat management activities related to the munitions remedial actions that are required by the HMP (USACE, 1997) and BOs have been conducted for the units.

2.4 Regulatory Status

Since 1917 until base closure in 1994, Fort Ord primarily served as a training and staging facility for infantry troops. From 1947 to 1974, Fort Ord was a basic training center. The 7th Infantry Division was activated at Fort Ord on October 21, 1974 and was based at Fort Ord until base closure. Fort Ord was selected for closure in 1991. The majority of the soldiers were reassigned to other Army posts in 1993. There is no longer an active Army division stationed at the former Fort Ord.

Fort Ord was placed on the National Priorities List of Superfund sites by the EPA on February 21, 1990, due to evidence of contaminated soil and groundwater. A Federal Facility Agreement (FFA) was signed by the Army, EPA, Department of Toxic Substances Control (DTSC), and the Regional Water Quality Control Board, a part of the California EPA. The FFA established procedures and schedules for conducting remedial investigations (RIs) and feasibility studies (FSs) and requires remedial actions be completed as expeditiously as possible. The former Fort Ord was selected in 1991 for BRAC, and the base was officially closed in September 1994. The Army began investigating and removing MEC at the former Fort Ord after the BRAC listing and a munitions response RI/FS began in 1998. In April 2000, an agreement was signed between the Army, EPA, and DTSC to evaluate MEC at the former Fort Ord subject to the provisions of the FFA.

Following completion of the *Final Track 3 Impact Area Munitions Response Area Munitions Response Remedial Investigation/Feasibility Study Former Fort Ord, California* (MACTEC Engineering and Environmental Services [MACTEC], 2007), the Army prepared the Track 3 ROD (Army, 2008), which is the decision document presenting the selected remedial action for MEC in the Impact Area MRA. The remedy was selected following a 60-day public comment period that ended on August 27, 2007, for the *Superfund Proposed Plan Remedial Action is Proposed for Impact Area Munitions Response Area, Track 3 Munitions Response Remedial Investigation / Feasibility Study, Former Fort Ord, California* (Army, 2007). The remedy was selected in accordance with the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA), as amended by the Superfund Amendments and Reauthorization Act of 1986, and, to the extent practicable, the National Oil and Hazardous Substances Pollution Contingency Plan.

The decision documented in the Track 3 ROD (Army, 2008) is undertaken pursuant to the President's authority under CERCLA Section 104, as delegated to the Army in accordance with Executive Order 12580, and in compliance with the process set out in CERCLA Section 120. The selection of the remedy is authorized pursuant to CERCLA Section 104, and the selected remedy is being carried out in accordance with CERCLA Section 121. The Army and the EPA jointly

selected the remedy. The California EPA, as represented by the DTSC, had an opportunity to review and comment on the Track 3 ROD (Army, 2008).

2.5 Site Features and History of Military Munitions Use

Since 1917 until base closure in 1994, portions of former Fort Ord were used by cavalry, field artillery, and infantry units for maneuvers, target ranges, and other purposes. Military munitions were fired and used on the facility, including artillery and mortar projectiles, rockets and guided missiles, rifle and hand grenades, land mines, pyrotechnics, bombs, and demolition materials.

Fort Ord was selected in 1991 for decommissioning, but troop reallocation was not completed until 1993, and the base was not officially closed until September 1994. The property remaining in the Army's possession was designated as the Presidio of Monterey Annex on October 1, 1994, and subsequently renamed the Ord Military Community. Although Army personnel still operate parts of the base, no active Army division is stationed at the former Fort Ord. Since the base was selected in 1991 for BRAC, site visits, historical and archival investigations, military munitions sampling, and removal actions have been performed and documented in preparation for transfer and reuse of the former Fort Ord property. The Army currently retains the Ord Military Community and the U.S. Army Reserve Center located at the former Fort Ord. The remainder of Fort Ord was identified for transfer to federal, state, and local government agencies and other organizations and, since base closure in September 1994, has been subjected to the reuse process.

The Impact Area MRA is a complex of numerous former military ranges with a variety of historical uses, designs, and characteristics. Over the years, various types of munitions have been used during training activities within the Impact Area MRA including artillery and mortar projectiles, rockets and guided missiles, rifle and hand grenades, land mines, pyrotechnics, bombs, and demolition materials. Select ranges were used for small arms training activities only, while other ranges are characterized as multi-use. In general, the firing points of the ranges were located near the perimeter of the MRA, and firing was directed toward the interior portion of the range complex. Training activities at the Impact Area MRA ceased after the closure of Fort Ord in 1994. The former ranges within the MRA contain similar expended munitions and MEC. The Impact Area

MRA is fenced, warning signs are posted, and access is controlled by the Army. The perimeter of the Impact Area MRA is patrolled to detect and prevent trespassing.

2.6 History of the Establishment of the Fuel Break System

Following base closure, many of the original roads that served as fuel breaks in the historical impact area had become overgrown with vegetation and restricted by poor access. To reduce the threat posed by potential wildfires and to optimize access and fire suppression capabilities, the Army reestablished the fuel break system within the historical impact area beginning in 2001. The fuel breaks were designed to be 45 to 50 feet wide and consist of a central road of 15 to 20-foot width, with 15-foot wide areas cleared of vegetation on either side of the fuel break road. Fuel breaks were divided into grids approximately 100 feet in length for establishment and maintenance tracking.

2.7 Summary of MEC-Related Activities Prior to the Remedial Action

Prior to the development of the Track 3 RI/FS (MACTEC, 2007) and the Track 3 ROD (Army, 2008), MEC removal was performed within the fuel break network by CMS Environmental, Inc. (later renamed USA Environmental, Inc.) and Parsons. The work was conducted in accordance with the approved final work plans outlined below.

Work Plan/Administrative Record (AR) #	Contractor	Date
OEW Sampling and Removal Action Work Plan, Fort Ord, CA (OE-0130)	CMS Environmental	August 1995
Former Fort Ord OE Cleanup, Programmatic Work Plan (later replaced by Second Edition listed below)	Parsons	May 2001
Final Ranges 43-48 Site Specific Work Plan, Former Fort Ord, Monterey County, California, Ordnance and Explosives Cleanup (OE-0408K)	Parsons	August 2003
Former Fort Ord OE Cleanup, Programmatic Work Plan, Second Edition with Updates (OE-0297B)	Parsons	June 2004

USA Environmental conducted initial MEC removal operations in 1997 and 1998. This work was performed in order to facilitate safe travel within the historical impact area during MEC sampling activities, prevent the spread of accidental fires and manage controlled burns. Further detail regarding these operations are included in the *Final 4' OE Removal After Action Report, Inland Range Contract, Former Fort Ord, California, Site OE-15 (Roads and Trails)* (USA, 2001a) and the *Final 4' OE Removal After Action Report, Inland Range Contract, Former Fort Ord, California, Former Fort Ord Fuel Breaks* (USA, 2001b). Based on *Final Sampling & OE Removal Inland Range Contract Closure After Action Report, Former Fort Ord, California* (USA, 2001c), all detected anomalies were investigated and resolved.

The reestablishment of the fuel break system was conducted in three phases between 2001 and 2005. Phase 1 of the historical impact area fuel break maintenance program, conducted in 2001, reestablished 45-foot-wide fuel breaks adjacent to the paved roads around the perimeter of the historical impact area previously established and along several interior roads. Phase 2, conducted later in 2001, reestablished 45-foot-wide fuel breaks along additional interior roads to divide the historical impact area into manageable polygons. Phases 1 and 2 of the fuel break reestablishment included mechanical and manual vegetation removal followed by surface and subsurface removal of MEC to a depth of 4 feet along the central road within each fuel break to allow safe access for fire trucks and other vehicles. Within the 15-foot-wide corridors adjacent to the roads, surface removal of MEC was conducted to provide safe access for fire personnel. Subsurface removal operations were conducted by UXO technicians utilizing Schonstedt GA-52Cx magnetometers, and detected anomalies were investigated and removed to a depth of 4 feet. MEC items that were not safe to move were blown in place. MD items were documented as individual items when the type and model of the item could be identified. Total weight of MD per project was collected for inclusion in the Military Munitions Response Program (MMRP) database. During Phases 1 and 2, all detected anomalies were excavated and removed. Phases 1 and 2 of the fuel break reestablishment are documented in the *Final Maintenance Report Fuel Breaks Multi-Range Area (MRA) Former Fort Ord, Monterey, California, Ordnance and Explosives (OE) Cleanup* (Parsons, 2001).

Phase 3 of the fuel break reestablishment was performed from April 2001 to August 2005. It included 4-foot depth subsurface MEC removal along the 15-foot-wide corridors running along

each side of nine fuel break central roads cleared in Phases 1 and 2 and along the entire 45-foot width of Riso Ridge Road for use as defensible polygon roads within the historical impact area. Portions of previously-reestablished fuel breaks along Chinook Road and Phoenix Road were reworked due to extensive road repairs and erosion control that disturbed and mixed the soil, leading to the potential movement of subsurface MEC in the perimeter portions of the fuel breaks. Surface MEC removal, subsurface MEC removal, and MEC management were conducted in the same manner as Phases 1 and 2. During Phase 3, detected anomalies were excavated until encountering the source or reaching the specified depth of 4 feet. If a team reached that depth without finding the anomaly source, the team consulted with a USACE representative about whether to proceed with further excavation. Deeper excavations that necessitated the aid of mechanical equipment were limited to supporting those that directly contributed to the fuel breaks' abilities to support traffic for firefighting equipment and maintenance. Other locations such as culverts and asphalt roads were not excavated but recorded. Records indicated that subsurface investigations stopped at a depth of 4 feet in one grid, Riso Ridge E096 (current grid ID RI096). This grid was later included in a soil remediation excavation under the Site 39 soil remediation program. After the soil excavation, subsurface removal to a depth of 4 feet was conducted in the excavation area. As described in *Final Remedial Action Completion Report, Site 39 Inland Ranges Habitat Reserve, Former Fort Ord California, Updated December 2014* (Gilbane, 2014) all detected anomalies were investigated or resolved. Phase 3 of the fuel break reestablishment is documented in the *Final Reestablishment of Impact Area Fuel Breaks Phases 1, 2, and 3 After-Action Report Former Fort Ord, Monterey, California, Military Munitions Response Program* (Parsons, 2006).

The three phases of the fuel break reestablishment work were conducted within the confines of the approved work plans and subjected to QC and QA inspections and approval.

Munitions Response Site (MRS)-Ranges 43-48 South includes three fuel breaks: Oscar Road, Felix Road, and Broadway Bypass. MEC removal conducted by Parsons within these fuel breaks was performed under the *Final Ranges 43-48 Site Specific Work Plan, Former Fort Ord, Monterey County, California, Ordnance and Explosives Cleanup* (Parsons, 2003) and is documented in the *Final MRS Ranges 43-48 Interim Action Technical Information Paper, Former Fort Ord, Monterey, California, Military Munitions Response Program* (Parsons, 2007). During analog

subsurface removal, each anomaly location was excavated until the source of the anomaly was located and removed. In the DGM-based subsurface removal that followed, detected anomalies were investigated or resolved.

3.0 Overview of Remedial Action

3.1 Remedial Action Objectives

The remedial action objective (RAO) for the Track 3 remedy is to protect human health and the environment in a manner that complies with the ARARs. The RAO will be achieved by implementing the selected remedy of Technology-Aided Surface MEC Remediation, with Subsurface MEC Remediation in Selected Areas and Land Use Controls (LUCs). The selected remedy is designed to achieve both substantial risk reduction through MEC remediation and risk management through implementation of LUCs. The selected remedy best balances the risk reduction and associated environmental impacts in supporting the anticipated future use of the site as a habitat reserve. The presence of MEC in the Impact Area MRA was not identified as a concern in terms of explosives safety risks to ecological receptors. The network of fuel breaks within the Impact Area MRA was specified in the Track 3 ROD as a subsurface removal area.

Further statements regarding the RAOs are provided in the Final RD/RA Work Plan (USACE, 2009):

- "The selected remedy addresses current or potential explosives safety risks to human health and the environment from MEC within the Impact Area MRA."
- "The most significant short term objective is to remove surface MEC and prevent public access until MEC removal is completed."
- "The long-term objective is to make the property safe for required habitat management activities by supplementing the remedial action with appropriate institutional controls … that will effectively manage risk from any potentially residual MEC after the remedial action is completed."

The selected remedy for the Impact Area MRA identified in the Track 3 ROD (Army, 2008) includes the following components:

- Clearing of vegetation, to provide access for MEC remediation.
- Technology-aided surface MEC removal. The method consists of a technology-aided visual search to identify MEC at the ground surface. Technology aids include Schonstedt magnetometers to facilitate detection of surface MEC in areas where the ground surface is not visible. Recovered MEC would be detonated, using engineering controls.
- DGM to provide a record of anomalies to assist future property users in identifying areas where explosives safety support (e.g., onsite construction support) may be required for activities involving ground disturbance or intrusive work.
- Subsurface MEC removal in selected areas. Areas of subsurface removal include regularly maintained fuel breaks and access roads, a minimum 100-foot buffer area between habitat and development areas, and other areas to address specific risk and/or land use needs. Examples include proposed future habitat restoration sites and areas where there are high density of anomalies associated with impact areas where military munitions with sensitive fuzes were fired. Recovered MEC would be detonated, using engineering controls.
- Implementation of LUCs, including MEC recognition and safety training, construction support for ground disturbing or intrusive activities and UXO-qualified personnel support, access management measures including regular security patrols of the Impact Area MRA perimeter and maintenance of fences and signs, helicopter support for future prescribed burns in selected areas for future habitat management purposes, weed abatement support, and property transfer documentation that outlines land use restrictions, including prohibition of unrestricted land use.

This document addresses the subsurface MEC removal performed on the regularly maintained fuel breaks.

3.2 MEC Remedial Action

3.2.1 Remedial Action Chronology

As outlined in the Final RD/RA Work Plan (USACE, 2009) and the Final SSWP (Shaw, 2010), the following field activities were conducted to implement the MEC remedial action within the project area:

- Vegetation clearance, if necessary
- Grid and border survey
- Surface and subsurface MEC removal
- DGM survey with Real-Time Kinematic (RTK) navigation
- MEC detonation
- MD disposal

3.2.2 Variations from the Site-Specific Work Plan

Variances to the planned methods and areas described in the Final RD/RA Work Plan (USACE, 2009) and the Final SSWP (Shaw, 2010), occurred in response to unanticipated conditions or to improve the efficiency of MEC remedial activities.

Subsequent to the fuel break reestablishment work completed by Parsons and the signature of the Track 3 ROD, Chicago Bridge and Iron Company (CB&I; previously known as Shaw) and Gilbane (previously known as ITSI-Gilbane) completed subsurface removal work on additional acreage of the fuel breaks. Alterations to the layout of the fuel break system have been made in the intervening years as well, as site conditions have changed, resulting in the addition, removal, and realignment of fuel break segments. The current Impact Area MRA fuel break system includes 184 acres of fuel breaks, as shown on Figure 2. Changes from previous alignments include the following:

- The Eucalyptus Road and Barloy Canyon Road fuel breaks along the northern and eastern perimeters of the Impact Area MRA were not identified for subsurface MEC removal because they are outside the Impact Area MRA fence and paved.
- Impossible Canyon Road north of Hawkeye Road and south of Steep Road has been added as a fuel break.
- The Broadway Avenue fuel break between Broadway Bypass and Orion Road has been removed.

- Oscar Road northeast of Felix Road has been added as a fuel break.
- Felix Road northwest of Broadway Bypass has been added as a fuel break.
- The South Boundary Road fuel break adjacent to Units 4 and 5A has been removed.
- The Evolution Road fuel break north of Broadway Avenue has been removed.
- Hugo Road between Units 9 and 31 has been added as a fuel break.
- A portion of the Nowhere Road fuel break between Units 7 and 10 has been realigned to avoid an area prone to heavy erosion.
- A portion of the Chinook Road fuel break between Units 15 and 21 has been realigned to coincide with the roadway.
- A portion of Impossible Canyon Road has been rerouted in order to avoid an area prone to flooding.

3.2.3 Summary of Remedial Action Methods

Under the Final SSWP (Shaw, 2010), DGM data collection was the first step in the RA. This data was used to determine where DGM-based subsurface removal was conducted. In areas where DGM-based subsurface removal could not be conducted (high anomaly density areas), analog-based subsurface MEC removal was performed. Further detail is included in Section 7.1 of this document.

Obstacles (i.e., culverts, fenceposts, etc.) were identified in the field and subsurface removal was completed where possible. Subsurface removal targets in paved sections of fuel breaks were identified in the field and subsurface removal was completed at the locations designated for excavation. Portions of Austin, Hugo and Orion Roads were not excavated at the direction of the USACE. Any obstacle or paved section of a fuel break where subsurface removal was not completed is noted in the attached Tabs corresponding to individual fuel break segments.

Based on input from BLM white polyvinyl chloride (PVC) markers were placed to delineate the limits of subsurface MEC removal along the fuel breaks. Blue PVC markers were installed to indicate that subsurface MEC removal was not completed between the blue markers because of electromagnetic interference or other technical reasons.

The Final SSWP (Shaw, 2010) noted that in areas where removal to depth was previously conducted, DGM data would undergo the QC/QA process. Anomaly reacquisition and intrusive investigation was not anticipated but could have been conducted as part of the QC/QA process. Based on DGM data collected by Shaw, FWV 03-002 (ITSI, 2011a) noted that ten percent of the anomalies in those previous analog removal areas would be identified for intrusive investigation. This supplemental QC investigation was reported in *Technical Information Paper, Supplemental Quality Control Investigation, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California* attached to FWV 017 (KEMRON, 2018d). Based on this work a determination was made that portions of the Impact Area MRA fuel break system where MEC and MEC-like MD items were most likely to remain following subsurface removal correlated to the parts of the Impact Area MRA where 81 millimeter (mm) mortars were previously recovered, and where the pre-subsurface removal anomaly density was highest. Supplemental subsurface removal was recommended in 25.5 acres of the Impact Area MRA fuel breaks to address the possibility of MEC items remaining in these areas. Details of the supplemental subsurface MEC removal are presented in Volume 2.

Quality documents addressing this portion of fuel break remediation include the *MEC Procedures Supplement, Former Fort Ord, California* (ITSI Gilbane, 2011b) and the *Final, Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (KEMRON, 2016a).

Further detail regarding these remedial action methods are included in the sections below.
The supplemental subsurface MEC removal with AGC is reported in Volume 2.

4.0 Site Preparation

4.1 Vegetation Clearance

Vegetation clearance within the fuel break network was performed as required. Some manual mastication was performed on oak trees within the fuel break network. Vegetation clearance teams, with escort support from UXO-qualified personnel, removed vegetation from the fuel break network to a height of six inches or less. Mechanical equipment was used to cut the vegetation. In areas with dense vegetation that obscured visual inspection of the ground surface, a first cut was

made to a height between 18 and 24 inches above the ground. After visual inspection for MEC by UXO-qualified personnel, a second cut was made to a height of six inches or less above ground. In areas with medium-to-light vegetation where the ground surface could be observed before cutting, the vegetation was cut in one stage to a height of no more than six inches above ground. Manual tools (e.g., chain saws and trimmers) were used in areas where the mechanical cutter could not gain access and to trim tree branches.

UXO-qualified personnel provided UXO escort support during vegetation clearance, conducting a visual survey of the ground surface with the aid of Schonstedt magnetometers. When MD or suspected MEC was encountered, vegetation clearance personnel would stop operations until UXO-qualified personnel could determine if any hazard was associated with the item and remove the item if necessary.

4.2 Debris Removal

During and after vegetation clearance activities, range-related debris (RRD) and other debris were removed from the project area. Metal debris was recycled at a local recycler (A & S Metals), and other debris was disposed of at a local municipal landfill (Marina Landfill).

4.3 Grid and Border Survey

UXO and survey personnel, performing anomaly avoidance, established a grid system (generally 45 feet or 50 feet by 100 feet) across the project area. The grid system was tied into the Fort Ord Master Grid System. The grid nodes were marked with wooden stakes, each labeled with a unique identification marked on the southwestern corner stake.

5.0 Analog MEC Removal

Analog methods were used for MEC removal within the project area. Details regarding MEC items recovered during analog MEC removal are included in the individual Tabs at the back of this TIP.

5.1 Analog MEC Removal Field Methods Employed

Analog surface and subsurface MEC removal was conducted in fuel breaks prior to the May 2008 signature of the Track 3 ROD and after this date. UXO technicians used Schonstedt GA-52Cx magnetometers to locate anomalies within the fuel breaks where work was conducted. Special case areas were delineated using a global positioning system (GPS) and are included as shape files in the Fort Ord MMRP database. These include areas where obstructions were removed as well as areas where obstructions were left in place.

The following basic techniques were used to excavate anomalies during analog subsurface MEC removal operations: The UXO technician located anomalies with a handheld magnetometer and excavated those anomalies following location. Until each anomaly was identified, it was assumed that the anomaly source was MEC. Excavation was initiated adjacent to the anomaly. The excavation was continued until the excavated area had reached a depth below the top of the anomaly source as determined by frequent inspection with a magnetometer. Using progressively smaller and more delicate tools to carefully remove the soil, the excavation team expanded the sidewall to expose the metallic item in the wall of the excavation for inspection and identification without moving or disturbing the item. Once the item was exposed for inspection, the excavation team determined whether it was suspected MEC. If the item was not suspected MEC, it was removed and the area was rechecked with the magnetometer to ensure that a hazardous item was not hidden beneath it. If the item was suspected MEC, a determination was made as to whether it was acceptable to move or would require demolition in place. Items deemed acceptable to move were transported to the Explosives Storage Locker for subsequent consolidated demolition shot. If an item was deemed not acceptable to move, then a demolition in place was conducted.

The Non-Burn Areas SSWP provided the following process for subsurface investigation:

> 'All subsurface removals will be to the depth of detection of each particular instrument, with the caveat that any anomaly investigation below four feet in depth will be approved by the USACE OE Safety Specialist and USACE PM [Project Manager] prior to investigation. All anomaly investigations that are not resolved after reaching 4 feet in depth will be referred to the USACE OE Safety Specialist and USACE PM.'

Based on the MMRP database, no detected anomaly was left unresolved after reaching a 4-ft depth in excavation. Obstructing features such as functioning culverts that were not removed are identified in the figures in the Tabs for this report.

5.2 Analog MEC Removal Results

Analog MEC removal operations resulted in the location and removal of MEC items, MD, RRD and Other Debris from the fuel breaks. Specific details regarding MEC items and MEC removal operations from specific fuel breaks are included in the attached Tabs.

5.3 Analog Quality Control/Quality Assurance Surveys

During surface and subsurface MEC removal operations in the fuel breaks, the UXO Quality Control Supervisor (UXOQCS) was responsible for visually observing teams and conducting periodic spot checks to verify grids were receiving complete coverage during MEC removal operations. Additionally, blind QC seeds were placed by the UXOQCS during all analog (surface and subsurface) removal operations. Further detail is provided in the *Final, Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (KEMRON, 2016a).

Blind QA seeds were placed by the USACE Ordnance and Explosives Safety Specialist (OESS) during all analog (surface and subsurface) removal operations. The UXOQCS performed analog QC survey with a Schonstedt GA-52Cx magnetometer of at least 10% of completed MEC removal grids. All grids passed 10% analog QC surveys performed by the UXOQCS. Following completion of the analog QC survey, a QA survey was conducted by the OESS of at least 10% of analog MEC removal grids. All grids passed 10% analog QA surveys performed by the OESS.

6.0 Digital Geophysical Mapping

DGM survey operations were conducted across the entirety of accessible areas within the fuel break network. The DGM surveys were conducted with a vehicle-towed array consisting of three

EM61-MK2A sensors, supported by single hand-pulled EM61-MK2A units. The towed array was used to obtain data over all accessible areas within the project area while the single units were utilized primarily for fill in. DGM data acquisition, processing, analysis, and preparation of data deliverables were completed in accordance with the applicable contract project work and quality plans. DGM data quality was verified against measurement quality objectives detailed in the same plans. Further details are included in the *Technical Information Paper, Digital Geophysical Mapping of the Permanent Fuel Breaks, Former Fort Ord, California* (Final DGM TIP; Shaw, 2011a) which is included as Appendix A.

7.0 Digital (DGM and AGC-Based) MEC Removal

DGM-based and AGC-based MEC removal methods were used for MEC remediation within the Impact Area MRA fuel breaks after May 2008.

7.1 DGM Surveys and DGM-Based Subsurface MEC Removal

DGM-based subsurface MEC removal was conducted in fuel breaks after May 2008. DGM surveys were performed within the Impact Area MRA fuel breaks from August 2010 to February 2011. The surveys were conducted with a vehicle-towed array, consisting of three Geometrics EM61-MK2A sensors, as well as single hand-pulled Geometrics EM61-MK2A units. Both the array and hand-pulled units used RTK GPSs to provide positioning information for the geophysical sensor measurements.

Geophysical data were collected over all accessible areas within the fuel breaks. Some areas were deemed inaccessible to DGM survey equipment. Reasons for inaccessibility include terrain, cultural features, and standing vegetation.

DGM-based subsurface MEC removal was conducted in fuel break polygons where less than 20% of Geometrics EM61-MK2A (four-channel sum) readings were above the project threshold of 14 millivolts (mV). The 14mV threshold is the standard EM61 target detection threshold used on Fort Ord projects when conducting subsurface removal activities. It is based on the EM61 response amplitude of a 37mm projectile buried at a depth of 16 inches below ground surface. A detailed

discussion of the 14mV threshold is included in Attachment F to the *Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (KEMRON, 2016a). Analog subsurface removal was conducted in portions of the fuel breaks that were inaccessible to DGM equipment, and portions where more than 20% of the EM-61 readings were higher than the 14mV project threshold.

In areas where DGM based subsurface MEC removal was performed, DGM data were reviewed to ensure the data met Category A standards. The performance objective for Category A DGM surveys is to locate all MEC and MEC-like targets to the depths demonstrated during the *Ordnance Detection and Discrimination Study (ODDS) Volume I Former Fort Ord, Monterey, California Ordnance and Explosives (OE) Cleanup* (Parsons, 2002) plot surveys. The *Final, Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (KEMRON, 2016a) describes the measurement quality objective for Category A Surveys. Details for specific fuel break sections are included in the attached Tabs.

7.1.1 Anomaly Reacquisition

Coordinates for geophysical target lists were exported to comma-separated files suitable for import into the Leica GPS rovers and field personal digital assistants (PDAs). Targets were then relocated and flagged in the field at each target's coordinates. Once flagged, the field teams moved a single Geometrics EM61-MK2 (in real time) over the flagged location in different directions to locate the anomaly peak. The flag was relocated to the peak location, and the offset from the original target list location was recorded in field PDAs. The final instrument readings (in mV) were also recorded in field PDAs to insure that the correct anomaly was relocated. All reacquisition activities were downloaded into the project database daily.

7.1.2 Anomaly Excavation

DGM targets were located with the aid of Schondstedt magnetometers. UXO technicians continued excavations until the source of the anomaly was located or to a depth of 4 feet below ground surface. All anomalies were treated as suspected MEC until identified as non-MEC items.

After each anomaly was excavated, a field QC check of each excavation was conducted. The Geometrics EM61-MK2A was used by a member of the excavation team to assess the final mV reading in and around the excavation. An area consisting of a 3-foot radius was inspected around the excavation itself. If the highest value in the area was below the threshold for excavation the value was recorded in the PDA and the excavation was refilled.

During the excavation field activities, numerous excavations required more than one iteration of this process. For example, if values were above 14 mV after the first excavation attempt, the excavation was continued until the value was below 14 mV. The only exceptions were when residual sources existed in close proximity to the anomaly. This information was recorded in the Fort Ord MMRP database. Those exceptions included the presence of a cultural object nearby (metal fence stake for example) or when there were two anomalies close to each other and one could not be resolved without digging the other. When the residual source was a nearby cultural object, the information was recorded and the anomaly investigation was considered complete. When the residual source was another nearby anomaly, both anomalies were eventually investigated and brought to resolution. There is no record of subsurface anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved.

7.1.3 DGM Quality Control/Quality Assurance

The DGM QC standards and procedures were outlined in the Final SSWP (Shaw, 2010) and subsequent project quality documents. The QC Geophysicist was responsible for planning and executing QC oversight of geophysical activities and ensuring compliance with geophysical QC requirements. Specifically, the QC Geophysicist was responsible for the following:

- Reviewing and approving the qualifications of geophysical staff,
- Planning and ensuring the acceptable performance and completion of all geophysical QC activities,
- Reviewing the geophysical QC and DGM data, target lists, and dig results as specified in the Final SSWP (Shaw, 2010) and subsequent updates,
- Establishing the known and blind seed item and location control program,
- Identifying quality problems and verifying that appropriate corrective actions were implemented for geophysical activities, and

- Ensuring that the requisite geophysical QC records, including submittals, were generated and retained as prescribed.

In order to keep track of weekly events and statistics, a weekly QC report was delivered to the Project Geophysicist and the QA Geophysicist. This included all pertinent information for the week as well as cumulative information about the project including, but not limited to, information such as grids surveyed, personnel, average acreage per day, and QC blind seeds located.

Quality documents addressing this portion of fuel break remediation include the *MEC Procedures Supplement, Former Fort Ord, California* (ITSI Gilbane, 2011b) and the *Final, Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (KEMRON, 2016a).

DGM data ultimately met established QC and QA standards. When data quality problems were identified, they were resolved prior to final review by the QC and QA Geophysicist.

7.2 Supplemental QC Investigation and AGC

A supplemental QC investigation was conducted within approximately 108 acres of the Impact Area MRA permanent fuel breaks that had undergone analog subsurface MEC removal prior to the Track 3 ROD, as described in *Technical Information Paper, Supplemental Quality Control Investigation, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California*. This document is included as an attachment to FWV 017 (KEMRON, 2018d).

The supplemental QC investigation resulted in additional subsurface MEC removal within 25.5 acres of the Impact Area MRA fuel break system which were determined to be at elevated risk of residual MEC items remaining in the subsurface due to a combination of high pre-analog survey anomaly density and the likely presence of deeply penetrating 81-mm mortar projectiles. The supplemental subsurface MEC removal was conducted utilizing a MetalMapper 2x2 advanced classification survey and subsurface removal of anomaly sources classified as potential targets of interest. Details of the supplemental subsurface MEC removal are presented in Volume 2.

Due to the end of the KEMRON task order at the Former Fort Ord, intrusive investigation of 1,543 targets representing potential TOI (including QC and QA seed items) remains in order to complete

the supplemental subsurface MEC removal under a future contract. The remaining intrusive investigations are on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). The remaining intrusive investigation locations are identified in Volume 2.

8.0 Quality Control/Quality Assurance (QC/QA)

This section discusses the QC and QA procedures that were used in the fuel breaks.

8.1 Quality Control

QC is conducted by the Contractor. All QC measures were conducted by the UXOQCS and by the QC Geophysicist. As described in Section 1.2, additional subsurface removal in 25.5 acres of the Impact Area MRA fuel break system was recommended as part of a supplemental QC investigation to address the possibility of MEC items remaining in these areas. Further information regarding the completion of this QC work is included in Volume 2. A discussion of other pertinent QC measures and procedures is included in the following sections.

8.1.1 Analog QC

8.1.1.1 Field Activities

During analog surface and subsurface removal operations in the fuel break, the UXOQCS was responsible for visually observing teams and conducting periodic spot checks to ensure grids were receiving complete coverage during the MEC removal phase. The UXOQCS performed analog QC survey of at least 10% of completed surface and subsurface MEC removal grids. All grids passed 10% analog QC surveys performed by the UXOQCS. Additionally, blind seeds were emplaced by the UXOQCS before and during surface and subsurface removal field operations. All blind seeds were located in the field by the UXO teams.

8.1.1.2 Database Activities

The UXOQCS reviewed every entry received from personnel in the field during each phase of work prior to entry in the database. Each entry was reviewed for completion of field QC, MEC and MD nomenclature, completion of a given grid, and ultimate disposition of MEC items.

8.1.2 DGM QC

The DGM QC standards and procedures were outlined in the Final SSWP (Shaw, 2010), and subsequent project quality documents. The QC Geophysicist had daily access to all geophysical QC and DGM data and was on site intermittently as needed after the completion of the initial inspections for geophysical activities. He was also on site as needed for meetings and seeding. The QC Geophysicist reported to the Contractor Quality Control Systems Manager (CQCSM) and supported the UXOQCS.

Quality documents addressing this portion of fuel break remediation include the *MEC Procedures Supplement, Former Fort Ord, California* (ITSI Gilbane, 2011b) and the *Final, Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (KEMRON, 2016a).

DGM data ultimately met established QC and QA standards. When data quality problems were identified, they were resolved prior to final review by the QC and QA Geophysicist.

8.2 Quality Assurance

QA is conducted by the USACE OESS and the USACE QA Geophysicist.

8.2.1 Analog Quality Assurance

Analog QA performed includes placement of QA seeds and a minimum 10% analog survey of each grid where MEC removal was performed. Analog QA details for specific fuel break sections are included in the attached Tabs.

8.2.2 DGM Quality Assurance

DGM QA activities included data review, placement of validation seeds in areas where AGC was conducted, and a minimum of 3-5% re-mapping with an EM61 in areas where DGM subsurface removal was conducted. A Quality Assurance Report is provided in Tab 10 and Tab 18.

9.0 MEC Removed

This section provides a discussion of the MEC and MD removed from the fuel breaks during the remedial action. All MEC items removed from the footprint of the fuel breaks (surface and subsurface) are included in this report.

9.1 MEC Removal

MEC was recovered and subjected to detonation during the course of the fuel break remedial action. A total of 1,119 MEC were removed and detonated during the course of the work described in this document. Table 1 provides a summary of MEC items for each fuel break. Details for specific fuel break sections are included in the attached Tabs. Former fuel break segments no longer included as part of the current fuel break network are shown on Figure 3. MEC items removed from these former fuel break sections are included in Table 2.

9.1.1 MD Removal

Recovered MD was characterized by weight on a grid-by-grid basis. MD and RRD were initially classified as Material Potentially Presenting an Explosive Hazard (MPPEH). Following initial classification, the MPPEH was certified by the Senior Unexploded Ordnance Supervisor (SUXOS), UXOQCS, and USACE OE Safety Specialist as either material documented as safe (MDAS) or material documented as an explosive hazard (MDEH). All MDEH was detonated. All MDAS was certified free from explosive material, and stored in lockable roll-off containers. All MDAS was demilitarized as appropriate. MDAS was inspected, certified and transported to a recycling facility. Department of Defense (DoD) shipping documentation accompanied the MDAS. An example of a DD 1348-1A form is included in Appendix B.

9.1.2 Detonation of Munitions and Explosives of Concern

During the course of the fuel breaks remedial action, all MEC items were destroyed by detonation. All procedures for demolition operations included in the Final SSWP (Shaw, 2010) and in updates were followed. All items were destroyed by detonation, and details, such as the date and result of this operation, have been reported in the Fort Ord MMRP database. An example of an Explosives Accountability Form is included in Appendix C.

9.1.3 Disposition of Munitions Debris

MDAS was transported to DoD certified metal recyclers for smelting and eventual recycling. DoD transport documentation accompanied the MDAS. MDAS under the current KEMRON contract was transported to Demil Metals for smelting and eventual recycling.

9.2 Conceptual Site Model

The distribution of all MEC items found and removed as part of this remedial action within the fuel breaks as well as the items recovered prior to the initiation of the remedial action, is shown in the attached Tabs. The observed distribution of surface and subsurface MEC throughout the fuel breaks is consistent with the varied uses of the Impact Area MRA. Table 1 provides a summary of MEC items for each fuel break.

10.0 Environmental Protection

10.1 Description of Impacts and Mitigation Measures

The project area is within the Natural Resource Management Area, which is designated for transfer to BLM as undeveloped habitat reserve as described in the HMP (USACE, 1997). The HMP (USACE, 1997) describes special land restrictions and habitat management requirements within habitat reserve areas. Habitat reserve areas support plant and animal species protected under the Endangered Species Act; implementation of mitigation measures identified in the HMP (USACE, 1997) are required to minimize potential adverse impacts to listed species.

In addition to the HMP (USACE, 1997), multiple BOs have been issued by the USFWS over the years as a result of consultation with the Army. In 2015, the USFWS issued a Programmatic BO that superseded the previous BOs (USFWS, 2015). Then, on June 7, 2017, the USFWS issued a reinitiated Programmatic BO that supersedes the 2015 Programmatic BO. The Programmatic BO (USFWS, 2017) contains additional conservation measures and recommendations relating to environmental remediation at former Fort Ord cleanup sites.

Although the project area is within the Natural Resource Management Area, the HMP allows for development-oriented uses or buildings on 2% or less of this area; the fuelbreaks are included in this 2%. Implementation of conservation measures is not required within this 2%; however, activities within these areas may affect adjacent habitat reserve areas if environmental protection measures are not implemented. As such, environmental protection measures were implemented within the fuelbreaks, including, but not limited to:

- Employees and subcontract workers received training on former Fort Ord natural resource protection prior to starting work.

- Habitat Checklists (HCLs) were prepared by the Project Biologist outlining the specific avoidance and minimization measures to be implemented during work activities. The HCLs were reviewed and approved by the BRAC Biologist and the QC Manager. The avoidance and minimization measures were communicated to the project supervisors and field personnel in preparatory meetings prior to work initiation.

- The footprint of the work areas were limited to the smallest area necessary to conduct the work activities. Work was not allowed outside of the fuelbreaks within the habitat reserve areas.

- Refueling of heavy equipment was permitted only within the fuelbreaks or approved main roads. Spill control materials, such as absorbent pads, noncombustible granular absorbent material, and polyethylene sheeting, was kept immediately available to all refueling crews. Refueling was not permitted within 100 feet of vernal ponds.

- Erosion control measures were implemented where necessary, including, but not limited to, placement of mulch or straw, re-contouring, and construction of water bars. Mowing within fuelbreaks was limited to a height of approximately six inches in a manner that avoided scraping the soil.

- All equipment coming from off-site was required to be pressure-washed prior to entering the Natural Resource Management Area to prevent and/or reduce the spread of invasive plant species.

- Standard protocols for California tiger salamander (CTS; *Ambystoma californiense*) and black legless lizard (*Anniella pulchra nigra)* encounters were implemented. Any excavations six-inches or deeper left open overnight were required to be covered or to have ramps placed within them to prevent CTS or other wildlife from becoming entrapped.

- Protection measures for some HMP plants were implemented on a case-by-case basis, including avoidance, topsoil preservation, and transplantation.

- Removal of coast live oak trees greater than four inches was prohibited; however, limbing up to six or eight feet was permitted to remove fuels and increase access beneath the trees.

11.0 Protectiveness Assessment

The protectiveness of the remedial action was evaluated against the requirements of the Track 3 ROD (Army, 2008). The remedial action performed in the fuel breaks was consistent with the Final SSWP (Shaw, 2010) and Track 3 RD/RA Work Plan (USACE, 2009), and no conditions contrary to these documents were encountered at the site.

The MEC remedial action for the project area is complete. All subsurface MEC remediation areas passed QC/QA. As discussed in Section 1.2 and 8.1, additional subsurface removal in 25.5 acres of the Impact Area MRA fuel break system was recommended as part of a supplemental QC investigation to address the possibility of MEC items remaining in these areas. The assessment of those segments is complete, and supplemental subsurface investigation was conducted. Some selected anomalies remain to be intrusively investigated as identified in Volume 2. The anomaly information should be considered when providing construction support or anomaly avoidance for any intrusive activities that may occur (e.g. road maintenance).

While the white PVC markers indicate completion of subsurface MEC removal within the footprint of fuel breaks, the blue PVC pipes indicate that subsurface MEC removal was not completed between the blue markers because of electromagnetic interference or other technical reasons. Placement of blue markers was conducted after collaboration with BLM. Based on input from

BLM, routine maintenance activities may be conducted but between blue markers, subsurface work may only be after consultation with BRAC. These blue marker areas are shown in their respective Tabs.

Subsurface MEC removal was not completed in some asphalt sections of Austin Road, Hugo Road and Orion Road. These areas are shown on the appropriate Tab. Subsurface MEC removal was also not completed in asphalt areas that underlay perimeter gates to allow access to the Impact Area MRA.

Based on the Track 3 ROD (Army, 2008) and the Track 3 RD/RA Work Plan (USACE, 2009), the following actions will occur until all remedial actions within the Track 3 Impact Area MRA are complete:

- Annual inspection of surface removal areas until the site is stabilized,
- Site security of the Impact Area MRA will be maintained,
- Unauthorized public access to or within the Impact Area MRA will continue to be prohibited,
- MEC recognition and safety training as needed,
- Provision of UXO-qualified personnel support for intrusive work, and
- Follow-up habitat monitoring.

At the completion of the remedial action within the Impact Area MRA, the Army will evaluate the work completed against planned reuse activities and the suitability of the LUCs that were selected as part of the remedy. The results of this evaluation will be included in a Remedial Action Completion Report. A detailed LUC implementation plan will also be developed prior to property transfer, in coordination with the future landowner and the regulatory agencies.

1.0 Introduction

This Technical Information Paper (TIP) describes the Digital Geophysical Mapping (DGM) surveys conducted on the permanent fuel breaks located within the Impact Area Munitions Response Area (MRA) at the former Fort Ord, Monterey County, California. The permanent fuel breaks are classified as Group 2 in the *Final Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* (SSWP; Shaw, 2010). The DGM was performed by Shaw Environmental (Shaw) for the United States Army Corps of Engineers (USACE), Sacramento District, under Contract No. DACW05-96-D-0011, Task Order No. 016.

1.1 Site Location

The MRA consists of 6,560 acres within the former Fort Ord historical impact area. The permanent fuel breaks comprise approximately 179 acres within the MRA. Figure 1 shows the locations of both the Impact Area MRA and the permanent fuel breaks.

1.2 Purpose

DGM surveys were conducted in accordance with the SSWP. DGM surveys were conducted as the primary method for subsurface Munitions and Explosives of Concern (MEC) remediation investigation. As stated in the SSWP, the results of the DGM surveys will be used to:

- Identify anomalies requiring investigation/excavation in areas where subsurface removals are planned and determine the subsurface removal approach based on anomaly density.
- Identify additional anomalies requiring investigation/excavation in areas where subsurface removals were previously conducted.
- Serve as a record of anomalies left in place.

Previous contractors have performed surface and analog subsurface MEC removal over approximately 111 acres of the fuel breaks. Results of this work are included in the *Reestablishment of Fuel Breaks, Phases 1, 2, and 3 Final After Action Report (Parsons, 2006).* These areas of previous removal are designated within the Shaw surveys as category B DGM surveys as described in Section 2.2.5. The remaining permanent fuel break areas are designated as category A surveys and are also described in Section 2.2.5.

2.0 Digital Geophysical Mapping Operations

DGM surveys were performed at the fuel breaks from August 2010 to February 2011. The surveys were conducted with a vehicle-towed array, consisting of three EM61-MK2A sensors, as well as single hand-pulled EM61-MK2A units. Both the array and hand-pulled units used real time kinematic (RTK) global positioning system (GPS) for positioning of the geophysical sensor measurements. DGM was conducted in accordance with the SSWP.

Geophysical data were collected over all accessible areas within the fuel breaks. Figures 2 through 5 show the gridded results of the DGM survey. Some areas were deemed inaccessible to DGM survey equipment. Reasons for inaccessibility include terrain, cultural features, and standing vegetation. Follow-on field work will document specific reasons for inaccessibility on a grid by grid basis. If any additional surveys are performed in these areas, it will be documented as part of the follow-on work.

2.1 Geophysical Prove-Out

A geophysical prove-out (GPO) was performed at Munitions Response Site (MRS)-16 prior to the work detailed in this TIP. These GPO results were utilized for initial instrument and target selection parameters and are published in the *Draft Final MRS-16 Geophysical Prove-Out Report, Former Fort Ord, California (*Shaw, 2007). Methodology derived from the GPO was defined in the SSWP and adhered to for this field effort. The instruments were tested by surveying a test strip containing one inert hand grenade (2 inches), 37-millimeter (mm) projectile (10 inches) 60-mm mortar (12 inches), 81-mm mortar (30 inches), and 4.2-inch mortar (48 inches) periodically throughout the duration of the project. These depths were based on anticipated maximum penetration depth of these items in sandy soil like that found at the former Fort Ord.

2.2 DGM Surveys

DGM surveys were used as the primary method to locate subsurface anomalies within the fuel breaks.

2.2.1 Instrumentation

EM61-MK2A sensors (towed array and single units) were utilized to obtain DGM data within the fuel breaks. A Leica RTK GPS was used in conjunction with the EM61-MK2A sensors for positioning data.

2.2.1.1 EM61- MK2

The EM61-MK2A is a four-channel, high-sensitivity time domain electromagnetic (EM) sensor designed to detect shallow ferrous and nonferrous metallic objects with good spatial resolution

and minimal interference from adjacent metallic features. The EM61-MK2A consists of two 1-by 0.5-meter rectangular coils stacked 40 centimeters (cm) apart with the source/receiver coil located below a second receiver coil. A square wave EM pulse is generated with "time on" (positive and negative) and "time off" cycles. This induces subsurface eddy currents with an associated secondary magnetic field. The decay of the secondary magnetic fields is measured during "time off" cycles and stored as a millivolt (mV) response. By measuring the decay at "late times," the system can distinguish between natural earth materials and buried metal (ferrous and nonferrous) as the secondary field in metallic objects decays at a much slower rate than earth materials. For this project, data were recorded at four time gates from the bottom coil.

2.2.1.2 Leica GPS

Real-time kinematic GPS uses a base station that is set up based on a known position. Once the base station is established, it determines its location using satellites and then applies a correction based on the offset from the known coordinates at the location. This correction is then used by a rover that is in direct communication with the base station through a radio link. At relatively longer distances (i.e., several miles), line of sight is required; at shorter distances (as in this survey) line of sight is not required. RTK GPS is capable of collecting survey-grade measurements in real time and providing immediate accuracy of less than 5 cm.

A permanent base station located within Ranges 43-48 and maintained by Shaw was used during the fuel break DGM surveys.

2.2.2 Data Collection Procedures

The fuel breaks were divided into 100-foot (ft) by 45-ft or 100-ft by 50-ft polygons with unique alphanumeric IDs supplied by USACE. Shapefiles were loaded into field computers and were used for navigation and polygon identification in the field. During each survey, a crew member recorded the location of obstacles with a RTK Leica GPS receiver. The surveys were conducted up to the permanent fuel break boundaries except in cases where previous vegetation cut boundaries differed from the shapefiles provided by USACE. All surveys were conducted at 2-ft line spacing, although any gaps in the category B areas were only filled in according to those Measurement Quality Objectives (MQOs) described further in Section 2.2.5.

EM61-MK2A surveys utilized four time gate readings from the bottom coil. Readings were sampled at a minimum rate of 10 readings per second. GPS readings were logged at a rate of 1 reading per second. All data collection activities were recorded in field logs and later transferred into the project database. Field notes were monitored by data processors and the quality control (QC) geophysicist and are included in the data delivery forms. As detailed above, a combination of two different data collection modes were employed at the fuel breaks using the EM61-MK2A. These include the towed array and single unit manual systems.

2.2.2.1 Towed Array

The towed array system consisted of three EM61-MK2A coils mounted on a wheeled platform. The three units were mounted in parallel, wide end forward, such that the center-to-center coil spacing was 2.0 ft and the bottoms of the coils were set at the standard Geonics height of 42 cm (16 inches) above the ground. The wheeled platform was pulled with a tractor. Survey lanes were marked using a biodegradable foam marking system mounted to the tractor. The EM61-MK2A and GPS data were monitored and logged using MaglogNT software from Geometrics.

2.2.2.2 Single Unit/Manual

A single unit, consisting of an EM61-MK2A mounted on standard wheels and manually pulled, was primarily used for filling in data gaps caused by surface obstructions (tree stumps, logs, etc.) and gaps caused by inconsistent towed array survey paths. Data were recorded and/or observed using a standard field data logger controlled by the operator and RTK GPS was used for navigation. These data were then appended to the appropriate data set in order to fill in the dataset to fulfill the MQO requirements.

2.2.2.3 Daily Functional Quality Control Checks

Instrument tests were performed on a daily basis to ensure the instruments met the project QC requirements. As described in the *MEC Procedures Supplement* included with the *SSWP* (Shaw, 2010), the following instrument tests were performed:

- Static Background Test,
- Static Spike Test,
- Personnel Test,
- Cable Shake Test,
- Repeat Data/Lag Line,
- Static GPS Location Test, and
- Dynamic GPS Location Test.

These tests were performed at the beginning and end of each day the instruments were in use. If one of the instruments was not working properly, the field crew would resolve the issue before beginning the survey. If it was determined that an instrument was not working properly at the end of the day, the field teams notified the QC geophysicist and proper steps were taken to verify that the survey data met project QC standards.

In addition to the first six standard tests, dynamic GPS location tests were conducted. These consisted of placing a hitch-ball in the field area that was to be surveyed. The location of the hitch-ball was measured with a GPS prior to obtaining data. The hitch-ball was run over by the EM61-MK2A system. After processing the data, the location was checked to verify that the location was within specification (2 ft for category A surveys).

2.2.3 Data Processing and Anomaly Selection

Geophysical data were processed using Geosoft's Oasis Montaj and vendor supplied software. Oasis Montaj processing and anomaly selection included several steps:

- Transforming raw data to American Standard Code for Information Interchange (ASCII) xyz files: Using vendor supplied software, the data were converted from the native file format to ASCII data files suitable for import into Oasis Montaj.
- Reviewing initial data: Once raw xyz files were imported into Oasis Montaj, the coordinates were converted to the project coordinate system. Data coverage and quality were assessed by the data processors. If it was determined that data quality and coverage were acceptable, the data were further processed and anomalies were selected. If coverage and/or data quality objectives were not met, field teams were sent to either fill in data gaps or re-collect data where necessary.
- Correcting for instrument latency: Using the results of the daily repeat data test, geophysical data were shifted to account for the time lag inherent in the data logging system.
- Leveling data: Data were then leveled to the same background values removing the effects of instrument drift. The four leveled data channels for each coil were added together to create the 4-channel sum.
- Creating target lists: Once leveled and corrected for instrument latency, data were gridded using a minimum curvature gridding routine in Oasis Montaj. Targets were initially selected using an automated picking routine on the gridded data. Data processors then refined the target list by adding, removing, and moving targets.
- Creating polygons around areas with large concentrations of anomalies and/or saturated responses: These are then converted to ArcView shapefiles and submitted with the final data delivery.

Data processing procedures remained consistent for the fuel breaks. Target lists were created for polygons requiring subsurface removal. Targets were selected using a 4-channel sum of 14 mV. Data processing activities were logged in data processing forms and were submitted to the USACE. A detailed description of the processing steps is outlined in the *MEC Procedures Supplement* included with the *SSWP* (Shaw, 2010).

2.2.4 Data Delivery

Survey data were divided into separate polygons and/or polygon blocks prior to delivery. The delivery schedule was consistently met throughout the project. Raw data were submitted within 3 days of completion and processed data were submitted within 5 days of completion. If, for any reason, these data were delivered outside of the 3 or 5 day metrics, notes were included on the processing forms by the processors and/or QC geophysicist explaining the reason(s) for the late delivery. Raw data deliveries included the raw data in binary format, raw data in ASCII xyz

format, shapefiles delineating saturated response areas, and the field notes saved in PDF form. Processed data included the processed data in ASCII xyz format, the final targets lists, and the appropriate data processing forms. In all, a total of 1,366 whole or partial polygons were processed and delivered from the DGM data.

2.2.5 Measurement Quality Objectives

The permanent fuel breaks were surveyed using two categories of MQOs (A and B below):

Category A - subsurface removal areas: These areas include approximately 67 acres of the 45-ft permanent fuel breaks that have not undergone a previous subsurface removal.

Category B - non-removal areas: These areas include approximately 111 acres of areas that have had a previous analog removal to depth performed by prior contractors.

As part of the MQOs specified in the SSWP, the following items were monitored throughout the project:

- Background noise,
- Mean speed,
- Along track spacing,
- Across track spacing,
- Instrument latency corrections,
- Data leveling,
- Systematic noise,
- Anomaly selection,
- Positioning errors,
- Known location QC items,
- Blind seed/QC items, and
- Reacquisition.

The MQOs for the items above are the same with the exception of across track spacing. Category A areas require across track spacing of 2 ft with no cumulative gaps being larger than 4 square feet, excluding gaps due to obstacles. Category B areas require across track spacing of 3.5 ft with no cumulative gaps being larger than 9 square feet, excluding data gaps due to obstacles. The metrics for both categories are defined in the SSWP.

The geophysical QC plan called for the QC geophysicist to monitor all of the MQOs. The QC geophysicist monitored every polygon and if there were any non-conformances noted, actions were taken to assure that the specific metric was corrected before passing the polygon. These actions were documented in weekly QC reports to the USACE Project Geophysicist. During the DGM survey, the USACE quality assurance (QA) geophysicist monitored polygons after they

passed Shaw geophysical QC. Any comments or questions were addressed for specific polygons, and the issues were resolved between the Shaw Project Geophysicist and USACE QA Geophysicist. The appropriate action was then initiated. All category A polygons were confirmed to meet all MQOs before target lists were created and submitted to USACE.

2.3 Changes During Field Work

It was recognized during field work that many category A areas exhibit dense anomaly concentrations and are not suitable for individual DGM target selection. It was determined that additional surveys to obtain complete coverage in these areas served no practical purpose because these areas will potentially be remediated using a different approach like analog "mag and dig" or a combination of mag and dig and scraping of near-surface clutter. A meeting was conducted by Shaw, Innovative Technical Solutions, Inc., and USACE geophysicists to determine an appropriate metric for categorizing fuel break grids that are not suitable for individual DGM target selection. The decision was made at that time to defer fill in surveys and target selection for 142 surveyed category A grids that were determined to be potentially unsuitable for individual DGM target selection..

The project team proposed an approach to determine the cutoff between mag and dig vs. DGM target investigation in individual grids by calculating the percentage of EM61-MK2A (four channel sum) readings within each fuel break grid that are above the target selection threshold of 14mV. The proposed metric is to use a cutoff of 20%, wherein if 20% or more EM61-MK2A readings are above the project threshold of 14mV the grid will be recommended for mag and dig and no DGM fill-in will be performed. All grids with a percentage below this cutoff will be remediated by selecting and excavating DGM targets.

2.4 Inaccessible and Previously Surveyed Areas

Portions of grids along Riso Ridge and Wildcat Ridge were not surveyed because the center road portion consisted of asphalt. Another 12 whole grids at the south end of Wildcat Ridge were deemed inaccessible and were not surveyed because they consisted of an asphalt road with concrete culverts along the outer road buffers. Other obstructions consisted of culverts, trees, and berms. These were documented by the field teams in field notes and ArcGIS shapefiles and were included in the data deliveries submitted to USACE.

Prior to the start of field work, the South Boundary Road fuel break was excluded from DGM survey when the Bureau of Land Management (BLM) indicated that this area would not be maintained as part of the permanent fuel break system.

Additionally, DGM was not performed on portions of Watkins Gate Road, Orion Road, Broadway Avenue, and Austin as these were collected during previous operations at MRS- BLM Units 18 and 22, MRS-BLM Units 14 and 19, and Range 26.

Approximately 29 acres within the planned survey area were not surveyed. The unsurveyed portions of the permanent fuel breaks are summarized in the chart below and are documented in Field Work Variance 045 (Appendix A).

Un-surveyed Acreage	
Previously Surveyed	18.2
Excluded	9.3
Inaccessible	1.4

3.0 Results

Approximately 150 acres and 1,366 fuel break grids were surveyed. Areas that were inaccessible to the DGM platform were not surveyed. Additionally, portions of the fuel breaks containing asphalt and concrete were not surveyed. In total, approximately 9 acres requiring subsurface remediation were deemed inaccessible to DGM survey equipment. Approximately 44 percent of the accessible grids requiring subsurface remediation exhibited low anomaly saturation, and 56 percent of the accessible grids requiring subsurface remediation exhibited moderate to high anomaly concentrations from the DGM survey. These results are detailed in the chart below. Saturation percentages of individual grids requiring subsurface remediation are detailed in Table 1.

Percentage of Data above 14mV	**Number of Grids**	**Percentage of Grids Requiring Subsurface Remediation**	**Acreage**	**Proposed Remediation Method**
Low Saturation (below 20%)	321	43.55%	26.21	DGM Anomaly Reacquisition and Excavation
Moderate to High Saturation (20% and above)	416	56.45%	32.05	Mag and Dig
Total	737	100.00%	58.26	Mag and Dig

4.0 Conclusion

DGM surveys for the permanent fuel breaks are complete. Future work will include remediation of the fuel breaks that have not previously had any subsurface MEC remediation. The proposed

method for how these grids will be remediated is to conduct mag and dig subsurface MEC operations in grids with moderate to high anomaly concentrations and investigate DGM targets in grids with low anomaly concentrations. Saturation percentages of individual grids requiring subsurface MEC remediation are detailed in Table 1.

Field Work Variances

Shaw Environmental, Inc.

Field Work Variance No. TII-045

1 of 1

FIELD WORK VARIANCE

Project Name/Number	Fort Ord / 846075	CTO/WAD	CTO 16 / WAD 07
Applicable Document	Final, Site Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Area, Former Fort Ord, California (Non-Burn Work Plan)	Date: 2/7/11	

Problem Description:

The Non-Burn Work Plan referred to approximately 176 acres of permanent fuel breaks within the Fort Ord Impact Area MRA. Approximately 18 acres of permanent fuel breaks were surveyed as part of other DGM surveys covered under other Site Specific Work Plans. Subsequent to publishing of the Non-Burn Work Plan, Digital Geophysical Mapping with a towed array of remaining permanent fuel breaks commenced. During the course of permanent fuel break DGM survey it was determined that approximately 1.5 acres was inaccessible to towed array equipment and was not surveyed. An additional approximate 3.5 acre area was determined to have either an asphalt or concrete layer and was not surveyed either due to inaccessibility or to maintain the integrity of the concrete or asphalt layer. Approximately 9 acres along South Boundary Road originally included in the Non-Burn Work Plan and originally classified as part of the permanent fuel break network was removed from the fuel break network following discussion between BRAC and BLM. Therefore, DGM and subsurface removal in this area are not necessary. These areas described above are included on Figure 1.

Recommended solution:

Incorporate this FWV as an appendix to the existing Final Work Plan.

Impact on present and completed work:

No impact on completed work.

Recommended solution/disposition:

Implement as recommended.

Responses to Agency Comments

RESPONSES TO COMMENTS

Document:	Volume 1, Technical Information Paper, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California. June 2020; and Volume 2, Technical Information Paper, Supplemental Subsurface MEC Removal, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California. June 2020.
Commenting Organization:	U.S. Environmental Protection Agency (EPA), Region IX
Name:	Maeve Clancy
Date of Comments:	August 18, 2020

Comments on Volume 1

General Comment 1:

Volume 1, Technical Information Paper, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, Monterey County, California, dated June 2020 (hereinafter referred to as Vol. 1 TIP Fuel Breaks IAMRA), states that some of the early removal actions (RAs) were conducted to a four foot depth and that some later RAs were conducted to depth of detection. This would indicate that excavations deeper than 4 feet in some of the areas might encounter munitions and explosives of concern (MEC). It should be noted that some of the earlier documents that specified a four foot removal depth also provided for review of all stoppages at the four foot depth by the Army Ordnance and Explosives Safety Specialist (OESS). Based upon the OESS review, a decision was made as to whether the excavation should continue. Any unresolved anomalies were recorded for future reference. This information should be included in Vol. 1 TIP Fuel Breaks IAMRA. Please make this revision.

Response to General Comment 1:

In Section 2.7 Summary of MEC-Related Activities Prior to the Remedial Action, subsurface removals that were conducted by USA Environmental (1997 and 1998) and Parsons (2001 to 2005) are described. Some of them are noted as “removal to a depth of 4 feet.” Additional information is provided below.

- USA Environmental conducted subsurface removal in several range access roads and dirt roads in 1997 and 1998. The report, *Final 4’ OE Removal After Action Report, Inland Range Contract, Former Fort Ord, California, Site OE-15 (Roads and Trails)* (Administrative Record [AR] number: OE-0316), describes the scope as “4’ removal” utilizing Schonstedt GA-52Cx. The report also concludes that “all detected anomalies were intrusively investigated and removed from the site” (Section 2.5.2).

RESPONSES TO COMMENTS

- USA Environmental conducted subsurface removal in additional segments of the Impact Area fuel breaks in 1998. The report, *Final 4' OE Removal After Action Report, Inland Range Contract, Former Fort Ord, California, Former Fort Ord Fuel Breaks* (AR number: OE-0362) describes the scope as "4' removal" utilizing Schonstedt GA-52Cx. A subsequent report *Grid Sampling & OE Removal Inland Range Contract Closure After Action Report – Former Fort Ord* (AR number: OE-0368) describes: "USA Environmental actively pursued the investigation of all anomalies encountered during removal operations. If an anomaly was detected below the 4' below ground surface (bgs) permission from the USACE [U.S. Army Corps of Engineers] OE [Ordnance and Explosives] Safety [S]pecialist was received to continue the excavation. Only in those OE sites [where] the clearance depth was 1' bgs were deeper anomalies left uninvestigated. This statement is made to ensure personnel reading this document do not believe any anomalies detected by the Schonstedt 52Cx magnetometer were left uninvestigated in an OE site that a 4' OE removal was performed" (Section 6.1.1). Based on this statement, no detected anomaly was left uninvestigated during the 4-ft removal in the Impact Area fuel breaks conducted by USA Environmental.

- Parsons conducted subsurface removal on segments of the Impact Area fuel breaks in three phases. At the time, the work was termed "4-foot removal." As described in *Final Reestablishment of Impact Area Fuel Breaks Phases 1, 2, and 3 After-Action Report, Former Fort Ord, Monterey, California, Military Munitions Response Program* (AR number: OE-0560H), during Phases 1 and 2 (conducted in 2001) all detected anomalies were excavated and removed (Section 3.1.5).

- The same report describes that during Phase 3 (conducted in 2001-2005), detected anomalies were excavated until encountering the source or reaching the specified depth of 4 feet; if a team reached that depth without finding the anomaly (source), the team consulted with a USACE representative about whether to proceed with further excavation (Section 3.2.5). Such deeper excavation would necessitate the use of mechanical equipment (e.g., backhoe) to continue the subsurface investigation. As described in the report, "special requests" for the equipment was limited by Field Variance Form 3-0001, to "those that directly contribute to fuel breaks' ability to support traffic for fire fighting equipment and maintenance, such as backhoe work. The variance exempted performance of out-of-scope actions, such as moving culverts, asphalt roads, weather stations, steel-belted tires used for erosion control, cables and wires associated with infrastructure, and utility poles" (Section 6). Such "exempted" features (e.g., functioning culverts) that were not removed were documented in the report. Records of the Phase 3 operations in the Military Munitions Response Program (MMRP) database were reviewed. One grid, Riso Ridge E096 (current grid ID RI096) had a note indicating a presence of a berm and that work was stopped at 4-ft depth per USACE safety representative. This grid, along with adjacent fuel break grids, were later included in the

soil remediation excavation area of Historical Area 36 (HA-36). As described in *Final Remedial Action Completion Report, Site 39 Inland Ranges Habitat Reserve, Former Fort Ord, California, Updated December 2014* (AR number: RI-047C), a 4-ft MEC removal was conducted in the HA-36 soil excavation area in 2010. All detected and reacquired anomalies were intrusively investigated. There is no record of subsurface anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved.

- Subsurface removal during the interim remedial action in Ranges 43-48 was to the depth of detection. As described in *Final MRS Ranges 43-48 Interim Action Technical Information Paper, Former Fort Ord, Monterey, California* (AR number: OE-0590L), during analog subsurface removal, each anomaly location was excavated to depth, until the source of the anomaly was located and removed (Section 5.2). In the digital geophysical mapping (DGM)–based subsurface removal that followed, detected anomalies were investigated or resolved (Section 6.3).

As part of the post-Track 3 Record of Decision (ROD) work on the Impact Area fuel breaks, those segments for which analog-based subsurface removal was conducted prior to the Track 3 ROD were subjected to supplemental quality control (QC) investigation. The result of this evaluation led to the performance of the supplemental subsurface MEC removal. The results of the supplemental QC investigation was reported as part of *Field Work Variance 017 for Final, Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* (AR number: OE-0685D.14). The supplemental subsurface MEC removal is described in Volume 2 of the Technical Information Paper.

For clarification, the following revisions will be implemented in Section 2.7:

- At the end of the second paragraph (after the table of work plans), add "Based on *Grid Sampling & OE Removal Inland Range Contract Closure After Action Report – Former Fort Ord* (USA, 2001c), all detected anomalies were investigated and resolved."

- In the third paragraph, prior to the final sentence, a new sentence "During Phases 1 and 2, all detected anomalies were excavated and removed" will be added. The term "field break" will be corrected to "fuel break" in the fourth and final sentences.

- Before the last sentence of the fourth paragraph, the following text will be added: "During Phase 3, detected anomalies were excavated until encountering the source or reaching the specified depth of 4 feet. If a team reached that depth without finding the anomaly source, the team consulted with a USACE representative about whether to proceed with further excavation. Deeper excavations that necessitated the aid of a mechanical equipment were limited to supporting those that directly contributed to the fuel breaks' abilities to support traffic for the fire fighting equipment and maintenance, and were

completed. Other locations such as culverts and asphalt roads were not excavated but recorded. Records indicate that subsurface investigations stopped at a depth of 4 feet in one grid, Riso Ridge E096 (current grid ID RI096). This grid was later included in a soil remediation excavation under the Site 39 soil remediation program. After the soil excavation, subsurface removal to a depth of 4 feet was conducted in the excavation area. As described in *Final Remedial Action Completion Report, Site 39 Inland Ranges Habitat Reserve, Former Fort Ord, California, Updated December 2014* (Gilbane, 2014) all detected anomalies were investigated or resolved." The term "field break" will be corrected to "fuel break" in the final sentence.

- At the end of the sixth paragraph, add "During analog subsurface removal, each anomaly location was excavated until the source of the anomaly was located and removed. In the DGM-based subsurface removal that followed, detected anomalies were investigated or resolved."

Specific Comment 1:

Section 1.3, Project Personnel and Subcontractors, Page 5: This first sentence in this section notes that, "MEC removal work was performed with qualified Unexploded Ordnance (UXO) technicians who met or exceeded the requirements of Technical Paper 18, Minimum Qualifications for Personnel Conducting Munitions and Explosives of Concern Related Activities (Department of Defense Explosives Safety Board [DDESB])." However, the term "qualified Unexploded Ordnance (UXO) technicians" is an undefined term. All other references for the subject individuals presented in Vol. 1 TIP Fuel Breaks IAMRA refer to them as "UXO-qualified", a term defined in the appropriate Department of Defense (DoD) publications. To avoid confusion concerning technician qualifications, please replace the term "qualified Unexploded Ordnance (UXO) technicians" with the term "UXO-qualified technicians" or the term "appropriately qualified UXO technicians."

Response to Specific Comment 1:

For clarification, text in the cited section will be changed to "appropriately qualified Unexploded Ordnance (UXO) technicians."

Specific Comment 2:

Section 4.2, Debris and Target Removal, Page 18: The title of the section indicates that it will discuss debris and target removal. However, target removal is not specifically mentioned in the section. Please revise the section to include a discussion of target removal or change the title of the section to eliminate the reference to target removal.

Response to Specific Comment 2:

To reduce the chance of confusion, the section title will be revised to “4.2 Debris Removal.”

Specific Comment 3:

Section 7.1.2, Anomaly Excavation, Page 22: The first sentence in the section states, “DGM targets were located with the aid of Schonstedt magnetometers. UXO technicians continued excavations until the source of the anomaly was located or to a depth of 4 feet below ground surface.” This statement appears to conflict with the statement found in Section 1.1, Purpose and Scope, where the last bullet in the section reads “Subsurface MEC removal to depth of detection.” Please revise the cited sections to indicate that some of the work was done to a “depth of four feet” and some was done to “depth of detection.” Also, please include the reason(s) for this removal depth difference.

Response to Specific Comment 3:

The work plan for the subsurface removals in the Impact Area fuel breaks, *Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* (Non-Burn Areas SSWP; AR number: OE-0685D) provides the following description: “All subsurface removals will be to the depth of detection of each particular instrument, with the caveat that any anomaly investigation below four feet in depth will be approved by the USACE OE Safety Specialist and USACE PM [Project Manager] prior to investigation. All anomaly investigations that are not resolved after reaching 4 feet in depth will be referred to the USACE OE Safety Specialist and USACE PM.” The depth provision for consultation with USACE is an element of task and cost control for the cost-reimbursement contract. It is not meant to allow incomplete investigation of subsurface anomalies when subsurface removal to the depth of detection is intended. Records in the MMRP database of the post-ROD subsurface removals in the Impact Area fuel breaks were reviewed. There is no record of subsurface anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved. Features such as functioning culverts that were not removed are identified in figures in the Tabs of Volume 1 of the Technical Information Paper. Additional information is provided below.

- Shaw conducted its work in accordance with the Non-Burn Areas SSWP as well as more detailed field procedures described in *MEC Procedures Supplement to Site-Specific Work Plan*, included as Appendix A to the Non-Burn Areas SSWP. Section 2.4.4 of the MEC Procedures Supplement includes the following statement: “If an excavation depth of 4 feet is reached during excavation operations, the USACE OE Safety Specialist will be consulted by the UXOSO [UXO Safety Officer] to determine if further excavation is safe and warranted. If for any reason an anomaly is abandoned prior to resolution, the anomaly location will be surveyed using GPS [global positioning system]. Anomalies that are not fully investigated may be subject to BRAC [Base Realignment and Closure]

Cleanup Team discussion or evaluation." During its work on the Impact Area fuel breaks, Shaw did not identify any anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved.

- ITSI Gilbane followed the same procedure, which is also identified in its *MEC Procedures Supplement, Former Fort Ord, California* (AR number: OE-0737B). During its work on the Impact Area fuel breaks, ITSI Gilbane did not identify any anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved.

- Kemron conducted its work in accordance with the Non-Burn Areas SSWP as well as *Final, Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (AR number: OE-0884A). Standard Operating Procedure for Intrusive investigation of DGM Targets (UXO SOP 4) includes the following: "If the maximum excavation depth (as described in the SSWP) is reached during excavation operations, the USACE Ordnance and Explosives Safety Specialist (OESS) will be consulted by the Unexploded Ordnance Safety Officer (UXOSO) to determine if further excavation is warranted. If for any reason an anomaly is abandoned prior to resolution, the anomaly location will be surveyed using GPS. KEMRON will inform the USACE Project Manager (PM) and USACE OESS of anomalies that are not fully investigated." During its work on the Impact Area fuel breaks, Kemron did not identify any anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved.

In the third paragraph of Section 7.1.2, Kemron describes the iterative nature of the excavation process until the electromagnetic (EM) signal is below the threshold of 14 millivolts (mV). It notes: "The only exceptions were when residual sources existed in close proximity to the anomaly. This information was recorded in the Fort Ord MMRP database." According to the USACE Quality Assurance (QA) Geophysicist, those exceptions included the presence of a cultural object nearby (metal fence stake for example) or when there were two anomalies close to each other and one could not be resolved without digging the other. When the residual source was a nearby cultural object, the information was recorded and the anomaly investigation was considered complete. When the residual source was another nearby anomaly, both anomalies were eventually investigated and brought to resolution.

In the Wildcat Ridge fuel break, the QA included independent DGM data collection by USACE over a portion of the intrusive investigation areas post-excavation to confirm no anomalies remain. One target was picked from the QA DGM survey. The USACE OESS and QA Geophysicist investigated the target to a depth of 4 feet below ground surface without resolving the anomaly below the 14 mV detection threshold, and the target was categorized as a no find. The results of these surveys are described in *Former Fort Ord Wildcat Ridge Qualify Assurance Report: Digital Geophysical Operations*, which is included in Tab 18 of Volume 1 of the Technical Information Paper. All fuel break segments passed QA inspection.

Based on the information above, during the subsurface removals in the Impact Area fuel breaks, no detected anomaly was left unresolved after reaching a 4-ft depth in excavation.

For clarification the following revisions will be implemented.

- At the end of Section 5.1 (description of the procedures for analog investigation), add: "The Non-Burn Areas SSWP provided the following process for subsurface investigation: 'All subsurface removals will be to the depth of detection of each particular instrument, with the caveat that any anomaly investigation below four feet in depth will be approved by the USACE OE Safety Specialist and USACE PM [Project Manager] prior to investigation. All anomaly investigations that are not resolved after reaching 4 feet in depth will be referred to the USACE OE Safety Specialist and USACE PM.' Based on the MMRP database, no detected anomaly was left unresolved after reaching a 4-ft depth in excavation. Obstructing features such as functioning culverts that were not removed are identified in the figures in the Tabs for this report."

- At the end of Section 7.1.2 (description of the procedure for excavating targets selected from DGM data), add: "Those exceptions included the presence of a cultural object nearby (metal fence stake for example) or when there were two anomalies close to each other and one could not be resolved without digging the other. When the residual source was a nearby cultural object, the information was recorded and the anomaly investigation was considered complete. When the residual source was another nearby anomaly, both anomalies were eventually investigated and brought to resolution. There is no record of subsurface anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved."

Comments on Volume 2

General Comment 1:

Volume 2, Technical Information Paper, Supplemental Subsurface MEC Removal, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, Monterey County, California, dated June 2020 (hereinafter referred to as Vol. 2 TIP SSMR Fuel Breaks IAMRA), does not present a discussion of the previous removal actions (RAs) that had a four foot removal depth and the effect this may have had on the statements detailing the current removal results. The previous RAs included and Army Ordnance and Explosives Safety Specialist (OESS) review of all stoppages at the four foot depth so a decision could be made as to whether the excavation should continue. Any unresolved anomalies that remained were recorded for future reference. This should be stated at an appropriate location in Vol. 2 TIP SSMR Fuel Breaks IAMRA. Please make this revision.

RESPONSES TO COMMENTS

Response to General Comment 1:

Please see response to Volume 1, General Comment 1. While some of the subsurface removals that were conducted prior to the Track 3 ROD are noted as "removal to a depth of 4 feet," there is no record of subsurface anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved.

For clarification, the following statement will be added to the end of the final paragraph of Section 1.1: "There is no record of subsurface anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved. Please see Volume 1, Section 2.7 Summary of MEC-Related Activities Prior to the Remedial Action, for additional information."

Specific Comment 1:

Section 1.2, MEC-Related Activities and Data Collected Prior to the Supplemental Subsurface MEC Removal, Page 2: This section discusses the RAs conducted prior to the Supplemental Subsurface Removal that were conducted to depth of detection. However, this section does not discuss that some of the previous subsurface removals were limited to a maximum removal depth of four feet and the effect this would have on the stated overall RA results. Please revise the cited section to include information regarding any previous subsurface removals that were limited to a depth of four feet, as well as the effect this would have on the stated overall RA results.

Response to Specific Comment 1:

As noted in the response to Volume 2, General Comment 1, while some of the subsurface removals that were conducted prior to the Track 3 ROD are noted as "removal to a depth of 4 feet," there is no record of subsurface anomaly for which investigation ceased at 4-ft depth with its source remaining unresolved.

In Section 1.2, third bullet, text "removal to depth" appears in a quote from a previous document. No change will be made to the quoted text.

In Section 1.2, second paragraph, text "DGM and MEC removal to depth conducted under other remedial action activities" appears. The statement references the DGM-based subsurface removals conducted post-Track 3 ROD prior to the initiation of the supplemental QC investigation. The referenced segments were excluded from (it was not necessary to include) in the supplemental QC investigation or the subsequent supplemental subsurface MEC removal. An accounting of the referenced segments is provided in a report of the supplemental QC investigation attached to *Field Work Variance 017 for Final, Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* (AR number: OE-0685D.14). No change to the text is warranted.

RESPONSES TO COMMENTS

Specific Comment 2:

Section 5, Data Verification and Validation, Page 28-32: An issue concerning a data validation error is discussed in the subsections of Section 5 as follows:

- **Section 5.1 Quality Assurance Validation**: The first sentence in the second paragraph of this section states that, "The USACE QA Geophysicist has verified that all QA validation seed items were successfully detected during the dynamic detection survey and that all but one (discussed below) were selected as targets for the static classification survey in the grids that have been completed to date." This indicates that one seed was detected but not appropriately classified. As a result, the Corps of Engineers Quality Assurance Geophysicist requested that the contractor conduct a root cause analysis of the error.

- **Section 5.2, Root Cause Analysis and Corrective Action**: Section 5.2.2 Corrective Action, noted that the listed corrective actions would be initiated as needed. Included in the corrective actions was a requirement that stated, "If necessary, revise the dig list to include additional suspected TOI."

The corrective measures were initiated but no statement is provided in Section 5 advising whether or not the dig list required revision to include additional suspected TOI (target of interest). Please revise Section 5 and its subsections as necessary to clarify whether or not additional TOI were added to the dig list as a result of the root cause analysis.

Response to Specific Comment 2:

The implemented corrective actions are described in Section 5.2.2 Corrective Action. The first paragraph after the listed actions (page 30) concludes: "76 cued target measurements were reevaluated during the corrective action but none resulted in the addition of potential TOI to the intrusive investigation list." Additional information is also provided in Appendix E.

Document:	Volume 1, Technical Information Paper, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California. June 2020; and Volume 2, Technical Information Paper, Supplemental Subsurface MEC Removal, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California. June 2020.
Commenting Organization:	California Department of Toxic Substances Control (DTSC)
Name:	Brett Leary
Date of Comments:	August 14, 2020

Comments on Volume 1

Comment 1:

The second sentence of the introduction should be: “The munitions responses were conducted within the fuel breaks was performed by various contractors between 1997 and 2020.”

Response to Comment 1:

The text in the second sentence of the first paragraph of Section 1.0 will be revised to "between 1997 and 2020" as suggested. Field work associated with supplemental munitions and explosives of concern (MEC) removal using Advanced Geophysical Classification (AGC) extended into early 2020.

Comment 2:

Also in the introduction: “Munitions responses conducted within the fuel breaks occurred in four separate efforts: 1) Prior to the May 2008 signature of the Final Record of Decision Impact Area Munitions Response Area Track 3 Munitions Response Site Former Fort Ord, California (Track 3 Record of Decision [ROD]; United States Department of the Army [Army], 2008), 2) 2008 (post Track 3 ROD signature) – 2015 (Shaw Environmental and ITSI Gilbane prime contractors), 3) 2015 – 2020 (KEMRON prime contractor), and 4) supplemental MEC removal using Advanced Geophysical Classification (AGC).”

Response to Comment 2:

Only the field work associated with the fourth listed component, supplemental MEC removal using AGC, extended into early 2020. For clarification, the second paragraph of Section 1.0 will be revised as follows:

“Munitions responses conducted within the fuel breaks occurred in four separate efforts: 1) Prior to the May 2008 signature of the Final Record of Decision Impact Area Munitions Response

Area Track 3 Munitions Response Site Former Fort Ord, California (Track 3 Record of Decision [ROD]; United States Department of the Army [Army], 2008);~~,~~ 2) 2008 (post Track 3 ROD signature) – 2015 (Shaw Environmental and ITSI Gilbane prime contractors);~~,~~ 3) 2015 – 2019 (KEMRON prime contractor);~~,~~ and 4) supplemental MEC removal using Advanced Geophysical Classification (AGC) (2018-2020)."

Comment 3:

Reading through the electronic version of the document, though the Tabs are mentioned a few times, they seem too secondary and removed from the body. It is great that the main "Table 1 Fuel Break MEC Summary" provides a combined summary of the MEC Tables found in the Tabs. However, the Main Figures section only includes two general Figures (and a third seemingly out of place about the former fuel break segments) and provides no summary of Figures found in the Tabs. The remedial work completed on the fuel breaks would be better highlighted with some additional summary-level Figures. A picture is worth a thousand words.

Response to Comment 3:

As requested, an overview figure of MEC recovered in the fuel breaks will be inserted.

Comments on Volume 2

"DTSC has no comments on Volume 2."

Document:	Volume 1, Technical Information Paper, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California. June 2020; and Volume 2, Technical Information Paper, Supplemental Subsurface MEC Removal, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California. June 2020.

U.S. Army Corps of Engineers (USACE) revised the subject documents based on comments received on the draft (June 2020) versions. Those changes are described in the Responses to Comments included in the draft-final Volume 1. During data review as part of the comment responses, a data discrepancy was discovered. This led to additional data review which resulted in several updates. The additional updates are described below. Chenega Tri-Services and PIE Services provided assistance under the Fort Ord Base Realignment and Closure (BRAC) Support contract with USACE.

Updates to Volume 1

In the process of developing responses to agency comments, a data discrepancy was found. Two munitions and explosives of concern (MEC) items in Grid PE024 were not displayed in Figure BW2. This led to our team checking for additional discrepancies.

The MEC data presented in the draft Technical Information Paper (TIP), Volume 1, were compared to the current (1 September 2020) Military Munitions Response Program (MMRP) database. The following data issues were identified.

1. Several MEC items recovered by Parsons, Gilbane and KEMRON during their work in the fuel breaks were not included in the draft TIP. The recorded locations may not have reflected pinpoint accuracy, and they may be displayed by the geographical information system (GIS) as residing outside of the fuel break grids. Since the work was conducted in the 45-ft wide fuel break grids, they should have been included.

   In the draft TIP, locations of some MEC items near the edges of the fuel break grids had been manually adjusted by KEMRON and its Subcontractors to appear within the grids. The updated figures (in the draft-final version) display the MEC items using their locations in the MMRP database. As a result, some items appear outside the current fuel break grids.

2. Several MEC items recovered during surface removal in Watkins Gate Burn Area in 2003-2004, limited surface removal in Ranges 43-48 in 2001, and interim action in Ranges 43-48 in 2003-2005, were not included in the draft TIP. Grids for the fuel breaks running through the WGBA and Ranges 43-48 South were not “established” until much later. The MEC items that fall within the current fuel break grid boundaries should have been listed in the draft TIP.

3. It appears that during the Gilbane era, the Impact Area unit boundaries were adjusted to remove overlap between the 45-ft wide fuel breaks and the units. Items from surface

removal in the units were reported in unit-specific technical memoranda. Of these, MEC items that fall within the current fuel break grid boundaries should have been listed in the draft TIP. Several were not included.

4. Items within the MOUT Site Buffer that are co-located with Impossible Canyon Road fuel break grids should also have been included in the draft TIP.

5. Items within Unit 28 that are co-located with Impossible Canyon Road reroute fuel break grids should have been included in the draft TIP. Some were absent.

6. Several MEC items recovered during the supplemental subsurface removal using Advanced Geophysical Classification (AGC) (reported in TIP Volume 2) were not included in the draft TIP Volume 1.

7. One item, listed in Tab 11 Table 1 Mercury Road MEC Items as “cartridge, 40mm prac, M781” in Grid ME010 was correctly identified as a discarded military munition (DMM) at 0 inch depth. However, the depth of the item was misreported in Volume 2 and the MMRP database as 7 inches.

8. Two items listed as MEC in Tab 10 Table 1 Impossible Canyon Road MEC Items were determined to be misidentified. Records indicate that they had been confirmed as munitions debris (MD) after detonation. One of them was misidentified in the MMRP database as UXO. The other was correctly identified in the MMRP database as MD while listed as MEC in Volume 1.

9. Several items listed in Table 2 Former Fuel Break MEC Summary were determined to be located outside the former fuel breaks.

As a result of the data review, 63 MEC items were added, one was determined to be within a former fuel break, and two items were removed from the MEC listing. The following changes have been implemented in the draft-final TIP Volume 1.

1. Updated MEC tables and figures in the Tabs.
2. Updated Figure BW2 to show Pipeline Road (between Orion and Broadway Bypass) in gray (indicating former fuel break).
3. Updated the quantities in Table 1 Fuel Break MEC Summary. Total is 1,119 MEC items.
4. Updated Table 2 Former Fuel Break MEC Summary. Total is 337 MEC items.
5. Added Figure 2a Overview of MEC Recovered in Fuel Breaks (per DTSC comment).
6. Updated Figure 3 Overview of Former Fuel Break segments.
7. Updated Section 9.1 text where the total number of recovered MEC is noted.
8. Updated the MEC information in Volume 2 (please see explanation below).
9. Added these pages to the “responses to comments” appendix providing an explanation of the issues and a summary of changes.

In addition, the MMRP database has been updated to correct the misidentified items.

Updates to Volume 2

Further information on data issue #7 listed for Volume 1 is provided below.

On September 14, 2020 BRAC Support personnel identified a data discrepancy between the Fort Ord MMRP database and the Fuel Break TIP regarding a 40mm cartridge (practice, M781, discarded military munition [DMM]) discovered in grid ME010 (Mercury Road, grid 10) during additional subsurface removal using advanced geophysical classification. Volume 1 of DRAFT Fuel Break TIP listed the item as having been found at 0 inch, while the database listed its recovery depth as 7 inches. The two items also had unique location coordinates but were only separated by 1.7 inches. It was unclear whether two separate MEC items had been identified or if these were the same MEC item with incorrect information (depth, Unique ID, and location coordinates) recorded for one of the entries. Volume 2 of DRAFT Fuel Break TIP listed the item as "cartridge, 40mm, prac, M781", DMM, recovery depth of 7 inches, and as a Target of Interest (TOI).

The Senior Project Geophysicist and USACE Project Geophysicist reviewed the data and found that only a single modeled source was identified for intrusive investigation at this location. The recovered item identified as MD was found at 7 inches below ground surface, fitting quite well with the cued measurement prediction. The second recovered item (40mm cartridge) doesn't fit to any of the modeled sources in the cued measurement at that location; it was located on the surface and was found outside the grid boundary.

Corrections have been made to appropriate locations of Volume 2 to identify the two objects as

- 1ea. cartridge, 40mm, practice, M781, DMM, recovery depth 0 inch, incidentally found during work activities, and not a TOI.
- 1ea. projectile, 40mm, MD, recovery depth 7 inches, identified as Category 2 and recovered in Grid ME010.

The following changes have been made in the draft-final TIP Volume 2.

1. Executive summary: Updated to reflect the corrected numbers of TOI and MEC items.
2. Sec 3.3.1: Updated to reflect the corrected numbers of TOI and MEC items.
3. Table 3: Updated to correct the numbers of TOI and MEC items.
4. Section 5.3.2: Updated to provide clarification on incidental discovery of the DMM item.
5. Section 6.1: Updated to reflect the corrected numbers of TOI and MEC items.
6. Figure 6: Removed the 40mm cartridge from the figure of TOIs.
7. Figure 7: Added clarification that the 40mm cartridge is not a TOI.
8. Table C-3: Corrected the intrusive investigation result for the 40mm projectile as MD.
9. Added Appendix F, USACE memorandum regarding the MEC data discrepancy.

List of Figures

Figure AR1 Austin Road Overview

Figure AR2 Austin Road Fuel Break Road

Figure AR3 Austin Road Fuel Break Road

1.0 Austin Road

1.1 Site Location

Austin Road runs roughly north-south and is located in the western portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Austin Road is shown on Figure AR1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Austin Road permanent fuel break from 2001 through 2017. Both analog and digital equipment were used to conduct MEC removal. During this work a total of eight MEC items [two Discarded Military Munitions (DMM), six Unexploded Ordnance (UXO)] were removed from the Austin Road fuel break. These subsurface MEC items are shown on Figures AR2 through AR3 and are listed in Table 1. Table 2 lists MEC operations performed within the Austin Road fuel break.

Parsons Environmental conducted MEC remediation field work within the Austin Road fuel break from 2001 through 2005. The northern portion of Austin Road within the Watkins Gate Burn Area was subject to a surface removal after a fire in 2003. Gilbane conducted MEC remediation field work within the Austin Road fuel break from 2011 through 2014. KEMRON Environmental conducted MEC remediation field work within the Austin Road fuel break in 2017. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

The center portion (approximately 15 feet wide) of Austin Road between Broadway Avenue and Watkins Gate Road contains varying levels of asphalt through which subsurface anomalies were not investigated. Either anomalies in these sections should be investigated and removed, or construction support should be required during any intrusive activities in this area. This area is shown on the attached figures. Additionally, culverts remain in place on Austin Road. These are also shown on the attached figures and are delineated in the field using blue PVC markers.

2.3 Conclusion

MEC remediation has been completed within the Austin Road fuel break. As noted above, in the center portion of Austin Road between Broadway Avenue and Watkins Gate Road, either anomalies in these sections should be investigated and removed, or construction support should be required during any intrusive activities in this area. Additionally, construction support should be present during intrusive activities or further MEC remediation should be performed in areas where culverts precluded completion of subsurface removal.

Figure BW1 Broadway Avenue Overview

Figure BW2 Broadway Avenue Fuel Break Road

Figure BW3 Broadway Avenue Fuel Break Road

1.0 Broadway Avenue

1.1 Site Location

Broadway Avenue (formerly called Pipeline Road) runs roughly east-west and is located in the northern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Broadway Avenue is shown on Figure BW1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Broadway Avenue permanent fuel break from 1997 through 2015. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 80 MEC items, all UXO, were removed from the Broadway Avenue fuel break. These MEC items are shown on Figures BW2 through BW3 and are listed in Table 1. Table 2 lists MEC operations performed within the Broadway Avenue fuel break.

USA Environmental conducted MEC remediation field work within the Evolution Road fuel break in 1997 and 1998. Parsons Environmental conducted MEC remediation field work within the Broadway Avenue fuel break in 2001. The western portion of Broadway Avenue within the Watkins Gate Burn Area was subject to a surface removal after a fire in 2003. Gilbane conducted MEC remediation field work within the Broadway Avenue fuel break from 2012 through 2015. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

The portion of Broadway Avenue between Broadway Bypass and Felix Road was abandoned as a viable fuel break due to the presence of a steep hill subject to extreme erosion. Subsurface anomalies present within this portion of Broadway Avenue were investigated and removed. Broadway Bypass and Felix Road were ultimately established to serve as fuel breaks and are addressed in other tabs within this report.

2.3 Conclusion

MEC remediation has been completed within the Broadway Avenue fuel break. As noted above, the portion of Broadway Avenue between Broadway Bypass and Felix Road should remain abandoned as a viable fuel break due to the presence of a steep hill subject to extreme erosion.

List of Figures

Figure BB1 Broadway Bypass Overview

Figure BB2 Broadway Bypass Fuel Break Road

1.0 Broadway Bypass

1.1 Site Location

Broadway Bypass runs roughly north-south and is located in the northern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Broadway Bypass is shown on Figure BB1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed within the Broadway Bypass permanent fuel break from 2004 through 2018. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 22 MEC items [all Unexploded Ordnance (UXO)] were removed from the Broadway Avenue fuel break. These MEC items are shown on Figure BB2 and are listed in Table 1. Table 2 lists MEC operations performed within the Broadway Avenue fuel break.

Parsons Environmental conducted surface and subsurface removal work within what would later become the Broadway Bypass fuel break as part of an Interim Remedial Action for Ranges 43-48. Further detail of this operation is included in the *Final MRS Ranges 43-48 Interim Action Technical Information Paper, Former Fort Ord, Monterey, California, Military Munitions Response Program* (Parsons, 2007). Gilbane conducted MEC remediation field work within the Broadway Bypass fuel break in 2014. KEMRON Environmental Services, Inc. (KEMRON) conducted MEC remediation field work within the Broadway Bypass fuel break in 2017 and 2018. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

Broadway Bypass was established as a viable fuel break due to the presence of a steep hill on Broadway Avenue subject to extreme erosion which made this portion of Broadway Avenue impassable at times. Broadway Bypass subsurface MEC remediation involved advanced

geophysical classification that is not described further in this report. Further detail regarding this work is included in the *Final Remedial Action Report, Track 3 Impact Area MRA, Broadway Bypass Former Fort Ord, California* (KEMRON, 2019).

2.3 Conclusion

MEC remediation has been completed within the Broadway Bypass fuel break. As noted above, Broadway Bypass was established as a viable fuel break due to the presence of a steep hill subject to extreme erosion on Broadway Avenue.

List of Figures

Figure CH1 Chinook Road Overview

Figure CH2 Chinook Road Fuel Break Road

1.0 Chinook Road

1.1 Site Location

Chinook Road runs roughly north-south and is located in the northeastern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Chinook Road is shown on Figure CH1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed within the Chinook Road fuel break from 2001 through 2017. Both analog and digital equipment were used to conduct MEC removal. During this work a total of three MEC items [all Unexploded Ordnance (UXO)] were removed from the Chinook Road fuel break. These MEC items are shown on Figure CH2 and are listed in Table 1. Table 2 lists MEC operations performed within the Chinook Road fuel break.

Parsons Environmental conducted MEC remediation field work within the Chinook Road fuel break from 2001 through 2005. Gilbane conducted MEC remediation field work within the Chinook Road fuel break from 2011 through 2014. KEMRON Environmental Services, Inc. conducted MEC remediation field work within the Chinook Road fuel break in 2016 and 2017. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

The intersection of Chinook Road and Watkins Gate Road was used as a staging point for targets and other range-related debris when active training was occurring and during cleanup activities. Debris removed from other areas within the Impact Area MRA was staged here prior to placement on ranges, or before removal for ultimate disposal or recycling. Due to the presence of significant metallic debris in the subsurface, MEC remediation near the intersection of Chinook Road and Watkins Gate Road was conducted using analog methods.

2.3 Conclusion

MEC remediation has been completed within the Chinook Road fuel break.

Figure DA1 Darwin Road Overview

Figure DA2 Darwin Road Fuel Break Road

1.0 Darwin Road

1.1 Site Location

Darwin Road runs roughly east-west and is located in the southern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Darwin Road is shown on Figure DA1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed within the Darwin Road fuel break from 2001 through 2014. Both analog and digital equipment were used to conduct MEC removal. During this work a total of three MEC items [three Unexploded Ordnance (UXO)] were removed from the Darwin Road fuel break. These MEC items are shown on Figure DA2 and are listed in Table 1. Table 2 lists MEC operations performed within the Darwin Road fuel break.

Parsons Environmental conducted MEC remediation field work within the Darwin Road fuel break from 2001 through 2005. Gilbane conducted MEC remediation field work within the Darwin Road fuel break from 2011 through 2014. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

No areas of special note are documented for Darwin Road.

2.3 Conclusion

MEC remediation has been completed within the Darwin Road fuel break.

Figure EV1 Evolution Road Overview

Figure EV2 Evolution Road Fuel Break Road

Figure EV3 Evolution Road Fuel Break Road

1.0 Evolution Road

1.1 Site Location

Evolution Road (formerly called Maverick Road) runs roughly north-south and is located in the western portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Evolution Road is shown on Figure EV1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Evolution Road fuel break from 1997 through 2017. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 53 MEC items [53 Unexploded Ordnance (UXO)] were removed from the Evolution Road fuel break. These MEC items are shown on Figures EV2 through EV3 and are listed in Table 1. Table 2 lists MEC operations performed within the Evolution Road fuel break.

USA Environmental conducted MEC remediation field work within the Evolution Road fuel break in 1997 and 1998. Parsons Environmental conducted MEC remediation field work within the Evolution Road fuel break from 2001 through 2005. Gilbane conducted MEC remediation field work within the Evolution Road fuel break from 2011 through 2014. KEMRON Environmental Services, Inc. conducted MEC remediation field work within the Evolution Road fuel break in 2017. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

2.2.1.1 Northern Portion of Evolution Road

The northern portion (north of Broadway Avenue) of Evolution Road was abandoned as a viable fuel break. Subsurface anomalies present within this portion of Evolution Road were investigated and removed. Broadway Bypass, Felix Road and Oscar Road were ultimately established to serve as fuel breaks as a substitute for the northern portion of Evolution Road.

2.2.2 Southern Portion of Evolution Road

The southern portion of Evolution Road was rerouted as shown on Figure EV2. Subsurface anomalies present within the reroute and original portion of Evolution Road were investigated and removed.

2.3 Conclusion

MEC remediation has been completed within the Evolution Road fuel break. As noted above, the northern portion (north of Broadway Avenue) of Evolution Road was abandoned as a viable fuel break, and the southern portion of Evolution Road was rerouted as shown on Figure EV2.

Figure FE2 Felix Road Fuel Break Road

1.0 Felix Road

1.1 Site Location

Felix Road runs roughly north-south and is located in the northern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Felix Road is shown on Figure FE1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed within the Felix Road fuel break from 1997 to 2017. Digital and analog equipment was used to conduct MEC removal. During this work a total of 201 MEC items [all Unexploded Ordnance (UXO)] were removed from the Felix Road fuel break. These MEC items are shown on Figure FE2 and are listed in Table 1. Table 2 lists MEC operations performed within the Felix Road fuel break.

USA Environmental conducted MEC remediation field work within the Felix Road fuel break in 1997. Parsons Environmental conducted surface and subsurface removal work within what would later become the Felix Road fuel break as part of an Interim Remedial Action for Ranges 43-48. Further detail of this operation is included in the *Final MRS Ranges 43-48 Interim Action Technical Information Paper, Former Fort Ord, Monterey, California, Military Munitions Response Program* (Parsons, 2007). KEMRON Environmental Services, Inc. conducted MEC remediation field work within the Felix Road fuel break in 2017. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

Felix Road was established as a viable fuel break due to the presence of a steep hill on Broadway Avenue subject to extreme erosion which made this portion of Broadway Avenue impassable at times. Broadway Bypass was also established as a viable fuel break for the same reason.

2.3 Conclusion

MEC remediation has been completed within the Felix Road fuel break. As noted above, Felix Road was established as a viable fuel break due to the presence of a steep hill subject to extreme erosion on Broadway Avenue.

List of Figures

Figure HA1 Hawkeye Road Overview

Figure HA2 Hawkeye Road Fuel Break Road

1.0 Hawkeye Road

1.1 Site Location

Hawkeye Road runs roughly east-west and is located in the eastern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Hawkeye Road is shown on Figure HA1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Hawkeye Road fuel break from 2001 through 2020. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 80 MEC items [all Unexploded Ordnance (UXO)] were removed from the Hawkeye Road fuel break. These MEC items are shown on Figure HA2 and are listed in Table 1. Table 2 lists MEC operations performed within the Hawkeye Road fuel break.

Parsons Environmental conducted MEC remediation field work within the Hawkeye Road fuel break in 2001. Gilbane conducted MEC remediation field work within the Hawkeye Road fuel break in 2012 and 2013. KEMRON Environmental Services Inc. conducted MEC remediation field work within the Hawkeye Road fuel break in 2018 and 2020. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

No areas of special note are documented for Hawkeye Road.

2.3 Conclusion

MEC remediation has been completed within the Hawkeye Road fuel break.

List of Figures

Figure HU1 Hugo Road Overview

Figure HU2 Hugo Road Fuel Break Road

1.0 Hugo Road

1.1 Site Location

Hugo Road runs roughly east-west and is located in the southeastern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Hugo Road is shown on Figure HU1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed within the Hugo Road fuel break from 2015 through 2016. Both analog and digital equipment were used to conduct MEC removal. During this work a total of three MEC items [three Unexploded Ordnance (UXO)] were removed from the Hugo Road fuel break. These MEC items are shown on Figure HU2 and are listed in Table 1. Table 2 lists MEC operations performed within the Hugo Road fuel break.

KEMRON Environmental Services, Inc. conducted MEC remediation field work within the Hugo Road fuel break in 2015 and 2016.

2.2 Areas of Special Note

Hugo Road was established as a fuel break in anticipation of a prescribed burn planned for Unit 31. This planned prescribed burn has not occurred as of the time of this report. The western section of Hugo Road (near the intersection with Orion Road) contains a portion of asphalt, previously used as a helibase during other prescribed burn operations, through which subsurface anomalies were not investigated. Either anomalies in these sections should be investigated and removed, or construction support should be required during any intrusive activities in this area. This area is shown on Figure HU2. Surface use of the helipad including helicopter operations, vehicle operations, and surface maintenance may be conducted without construction support.

2.3 Conclusion

MEC remediation has been completed within the Hugo Road fuel break. As noted above, Hugo Road was established as a fuel break in anticipation of a prescribed burn planned for Unit 31. The

western section of Hugo Road (near the intersection with Orion Road) contains a portion of asphalt through which subsurface anomalies were not investigated. Either anomalies in these sections should be investigated and removed, or construction support should be required during any intrusive activities in this area.

Appendix A Quality Assurance Report: Digital Geophysical Operations

1.0 Impossible Canyon Road

1.1 Site Location

Impossible Canyon Road runs roughly north-south and is located in the eastern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Impossible Canyon Road is shown on Figure IC1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Impossible Canyon Road fuel break from 2001 through 2020. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 37 MEC items [three (Discarded Military Munitions) DMM, 34 Unexploded Ordnance (UXO)] were removed from the Impossible Canyon Road fuel break. These MEC items are shown on Figures IC2 through IC3 and are listed in Table 1. Table 2 lists MEC operations performed within the Impossible Canyon Road fuel break.

Parsons Environmental conducted MEC remediation field work within the Impossible Canyon Road fuel break in 2001. Gilbane conducted MEC remediation field work within the Impossible Canyon Road fuel break in 2012. KEMRON Environmental Services, Inc. conducted MEC remediation field work within the Impossible Canyon Road fuel break in 2018 and 2020. A Quality Assurance Report for the geophysical data collected by KEMRON is provided in Appendix A. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

The central portion of Impossible Canyon Road between Unit 20 and 28 was rerouted to avoid an area subject to frequent erosion problems due to the presence of an ephemeral stream during the fall and winter (wet season). This area is shown on Figure IC3. A section of Impossible Canyon Road will remain in use as a road until a new road can be built. Additionally, culverts remain in

place on Impossible Canyon Road. These are also shown on the attached figures and are delineated in the field using blue PVC markers.

2.3 Conclusion

MEC remediation has been completed within the Impossible Canyon Road fuel break. As noted above, the central portion of Impossible Canyon Road between Unit 20 and 28 was rerouted to avoid an area subject to frequent water inundation (flooding). Construction support should be present during intrusive activities or further MEC remediation should be performed in areas where culverts precluded completion of subsurface removal.

1.0 INTRODUCTION

This report covers the Quality Assurance (QA) processes conducted by the U.S. Army Corps of Engineers (USACE) with respect to the collection, processing, and evaluation of digital geophysical data collected by KEMRON Environmental Services, Inc (KEMRON). The field work was performed in Impossible Canyon fuel break. Work was performed under WERS contract No. W912DY-10-D-0027, Site-Specific Work Plan (Shaw, 2010) and FWVs as described in Impact Area MRA TIP (KEMRON, 2020). The field protocols, database management, and QA reviews were based on a combination of methods previously used in other units and described in the UFP-QAPP Volume II Appendix A (KEMRON, 2016a), along with additional procedures necessary for ensuring compliance with the WERS MMRP contract and the standard operating procedures performed by KEMRON's subcontractors GILBANE and NAEVA. USACE QA verified that KEMRON had an adequate Quality Control (QC) program in place and that data collected in Impossible Canyon fuel break were in accordance with project Data Quality Objectives (DQOs) and Measurement Quality Objectives (MQOs), as established in the UFP-QAPP (KEMRON, 2016a). Impossible Canyon fuel break DGM data were collected in their entirety to meet Category A spacing.

1.1 Site details

Impossible Canyon fuel break runs roughly north-south and is located in the eastern portion of the Impact Area Munitions Response Area (MRA), as depicted in Figure 1 (note that DGM data deviates from fuel break grids where fuel break was re-routed).

Clean-up operations pertinent to DGM activities are described in Impact Area MRA TIP (KEMRON, 2020).

According to the Installation-Wide Multispecies Habitat Management Plan (HMP) for Fort Ord (USACE, 1997), the site will be used as an undeveloped habitat reserve. The Impact Area is mostly covered by maritime chaparral and grassland habitats. The terrain in the Impact Area is dominated by rolling hills with elevations ranging from 720-900 ft. above sea level (ASL). These hills are composed of sand associated with Pleistocene aged sand dunes that may be as thick as 250 ft.

2.0 QA ACTIVITES

2.1 Data Collection Methods

Production geophysical data were collected using Geonics EM-61MKII electromagnetic sensors in a multi-coil configuration (towed array) throughout the Impossible Canyon fuel break. The EM-61MKII is a time-domain electromagnetic sensor that generates an electromagnetic pulse, inducing eddy currents within the subsurface. During the off period of the EM pulse, the eddy current decay produces secondary electromagnetic fields within

both ferrous and non-ferrous metallic objects. These secondary electromagnetic fields are received and recorded over four averaged time gates per data collection interval (10Hz).

Data were collected either as individual grids or in grid blocks of variable size consisting of multiple grids. All data collected met Category A line spacing requirements, with 95% not to exceed a lane spacing of 2 ft. and 100% not to exceed a lane spacing of 3 ft.

Obstacles and issues with terrain precluded 100% coverage and approximately 23.18 acres of the Impossible Canyon fuel break were either inaccessible due to erosion or determined by the UXO Safety to be inaccessible to DGM survey due to steep terrain. All data gaps were appropriately documented in the obstacle files submitted with DGM packages. Figure 1 of this QA report depicts the full DGM dataset for the Impossible Canyon fuel break.

The Impossible Canyon fuel break was identified for subsurface removal. Following completion of subsurface removal in the roads, the USACE collected a minimum of 3-5% QA DGM data over the intrusive investigation areas post-excavation to confirm no anomalies remain. A total of 48 targets were picked from the QA DGM survey. All targets were due to hot rocks, terrain, small arms casings, and small cultural debris. The results of these surveys are given in Figure 2 and Table 3. All fuel break segments passed QA inspection.

2.2 Field Oversight

Field oversight was performed intermittently throughout the project by both the USACE Project Geophysicist and the OESS. Appropriate field procedures were reviewed and found to be in compliance. Under the WERS Contract No. W912DY-10-D-0027, NAEVA is subcontracted to collect the geophysical data.

2.3 Geophysical System Verification

Under the WERS contract, USACE and KEMRON fully incorporated the physics based Geophysical System Verification (GSV) approach as described in the July 2009 ESTCP report (ESTCP, 2009) and supported by EM 200-1-15. GSV includes two methods for providing QA/QC: blind seeding and the instrument verification strip (IVS). IVS data results were recorded on daily QC submittals attached as PDF files to the grid blocks. Data were reviewed by the QA Geophysicist to ensure all MQOs were achieved. The QA data review process is described in section 2.4 and a summary of MQOs for towed array DGM operations are given in Table 1. Daily IVS test results for towed array DGM in the Impossible Canyon fuel break are shown in Figures 3-4. Further details regarding MQOs are provided in the UFP-QAPP (KEMRON, 2016a).

Production data required the GSV blind seeds placed throughout the Impossible Canyon fuel break, as documented in the UFP-QAPP (KEMRON, 2016a). By placing blind seeds at an average rate of one per day, the instrument functionality can be tested on a daily basis. Any failures to detect a blind seed could be indicative of an issue with data collection. All blind

seeds were small industry standard objects buried at six inches below ground surface. The blind seeds were placed by the QC Geophysicist. All blind QC seeds were detected and both the responses and positioning were within the requirements of the MQOs and SOPs. Table 2 summarizes the QC seed results for the Impossible Canyon fuel break.

2.4 Digital Data Review

A review of digital geophysics data by the USACE was performed to monitor the effectiveness of data processing and consistency of data delivery. Issues that were reviewed in these data included:

1) Missing survey lines within a grid (interline gaps)
2) Point-to-point data gaps along survey lines
3) Bowing out of survey lines beyond 50% of survey line spacing, unless otherwise collected
4) Unreasonable data "spikes"
5) Data incongruity across survey grids (Data levels in one grid are not reasonably compatible with data levels in neighboring grids)
6) Inadequate data density along survey traverse
7) Lack of accurate, precise locations; survey line orientation
8) Inadequate/incomplete site survey coverage
9) Missing, incomplete, or noncompliant instrument standardization checks
10) Completeness of file header information and supporting documentation
11) Consistent IVS and GSV results supporting the data quality objectives

To accomplish this, all raw and processed data files were checked by the USACE to ensure that KEMRON followed an appropriate and informative naming convention reflecting the grids surveyed as outlined in the EM 200-1-15. The USACE checked that KEMRON managed the field and processed data in a professional manner, including organization, daily maintenance, and complete documentation. This focused on a review of header files on the pre-processed data (data that has been merged into a single file and synchronized with the GPS data) and processed data to verify that dates were consistent, systems and system sampling parameters were identified, project name and contractor was listed, and all column headers were included and defined. KEMRON also delivered supporting summary sheets that further documented field parameters and processing. All of the summary sheets were reviewed for completeness, verification of calibration data, and consistency to the electronic data file headers.

In order to make the above process more efficient, a grid tracking spreadsheet located in the Impossible Canyon fuel break folder on the FTP site was updated weekly and allowed for the QC Geophysicist and USACE QA Geophysicist to document their verification of each deliverable. Minor issues such as corrupt or incomplete zip files were addressed within the table and via QC report deliverables. The final excel file will be maintained within the Final Data Submittal QC folder on the Fort Ord server.

The procedure for reprocessing and projecting the pseudo-color maps of the DGM data included starting with a 100% review of the data in Geosoft Oasis Montaj to include re-leveling and re-gridding. These digital data were imported into Geosoft for the generation of pseudo-color maps that were then exported as a georeferenced geotiff.

Overall, the general QA digital data review consisted at a minimum of:

1) Creating a processed database
2) Importing XYZ data
3) Calculation of sum channel
4) Generating a grid (0.25 ft. cell size and blanking distance of 2 ft.) of sum channel
5) Plotting the sum channel
6) Plotting a symbol cover for the track lines (view coverage)
7) Exporting the plots to geotiffs
8) Importing the geotiffs into a GIS

2.5 Discussion

No issues were identified during data review and no corrective action was issued.

3.0 CONCLUSIONS

QA activities by the Government verified KEMRON had an adequate QC program in place and that data collected within the Impossible Canyon fuel break are sufficient and in accordance with the project DQOs and MQOs. All dynamic DGM data in the Impossible Canyon fuel break meet Category A standards.

Figure 2

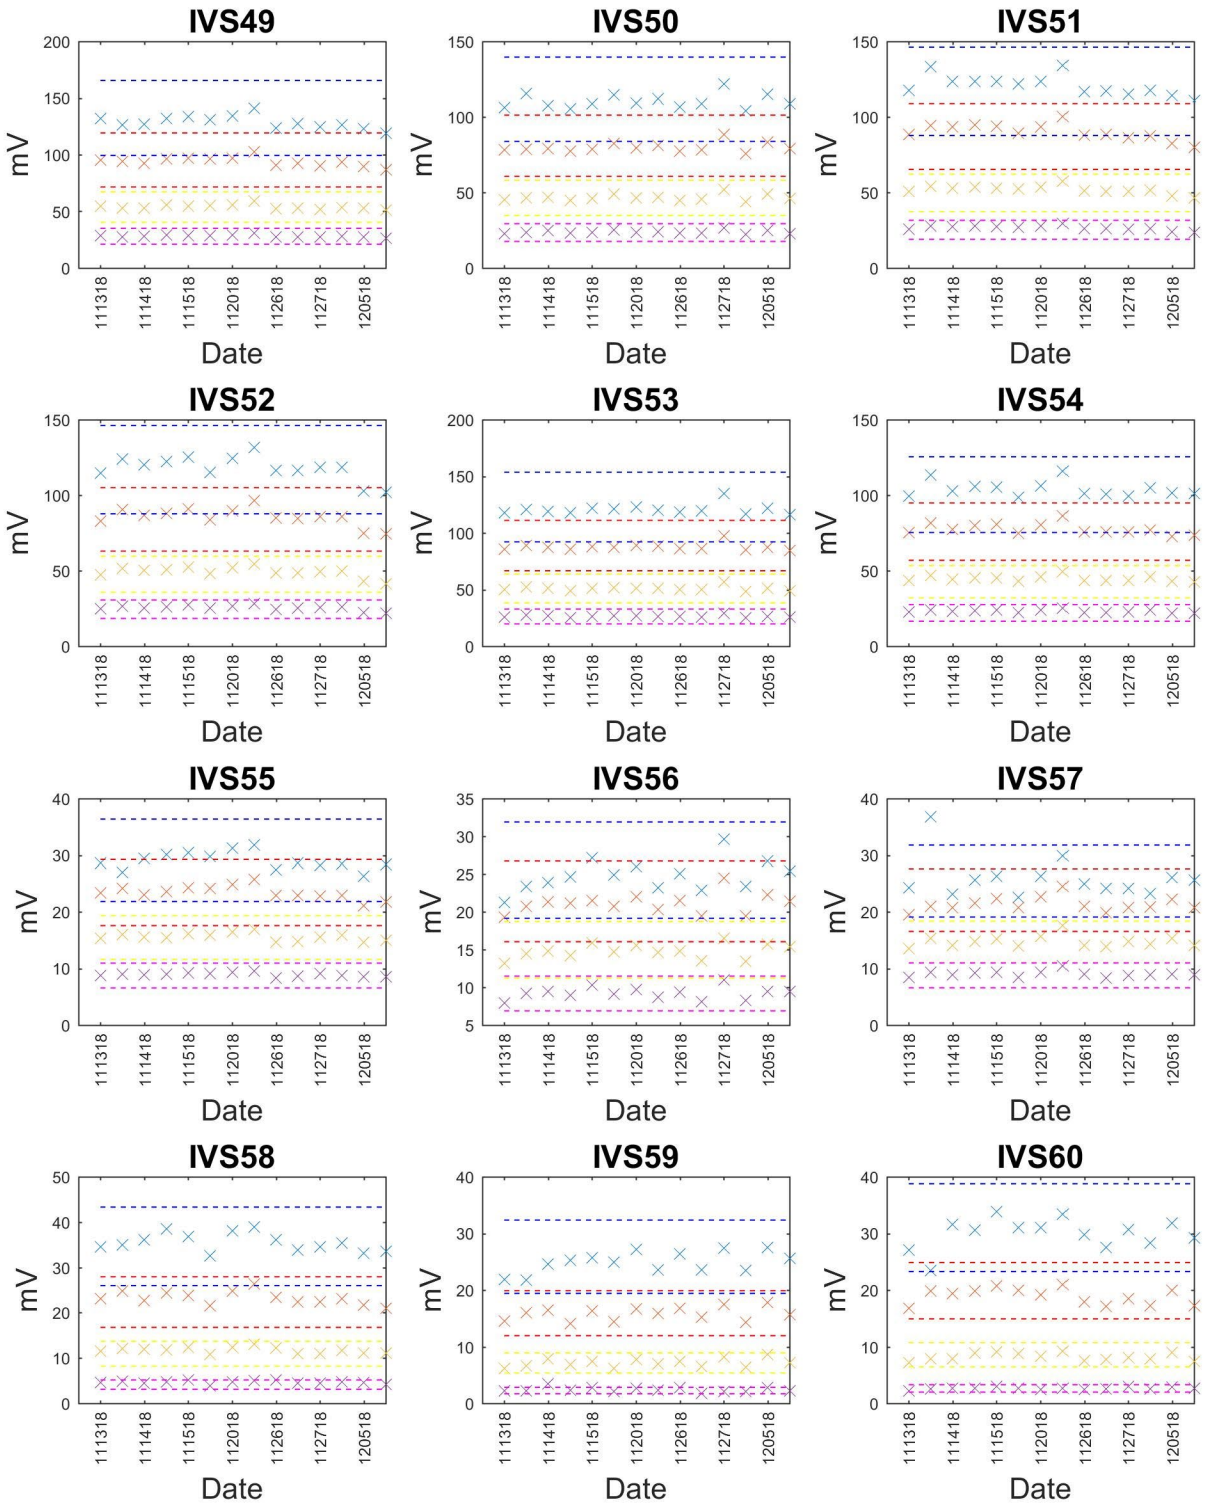

Figure 3. DGM response of Impossible Canyon fuel break IVS items for each day of DGM data collection. X symbols represent peak anomaly response for channel 1 (blue), channel 2 (red), channel 3 (yellow), and channel 4 (purple) for each IVS item. Dashed lines represent the allowable variability (+/- 25% of predicted response) established in WS #22 of the UFP-QAPP.

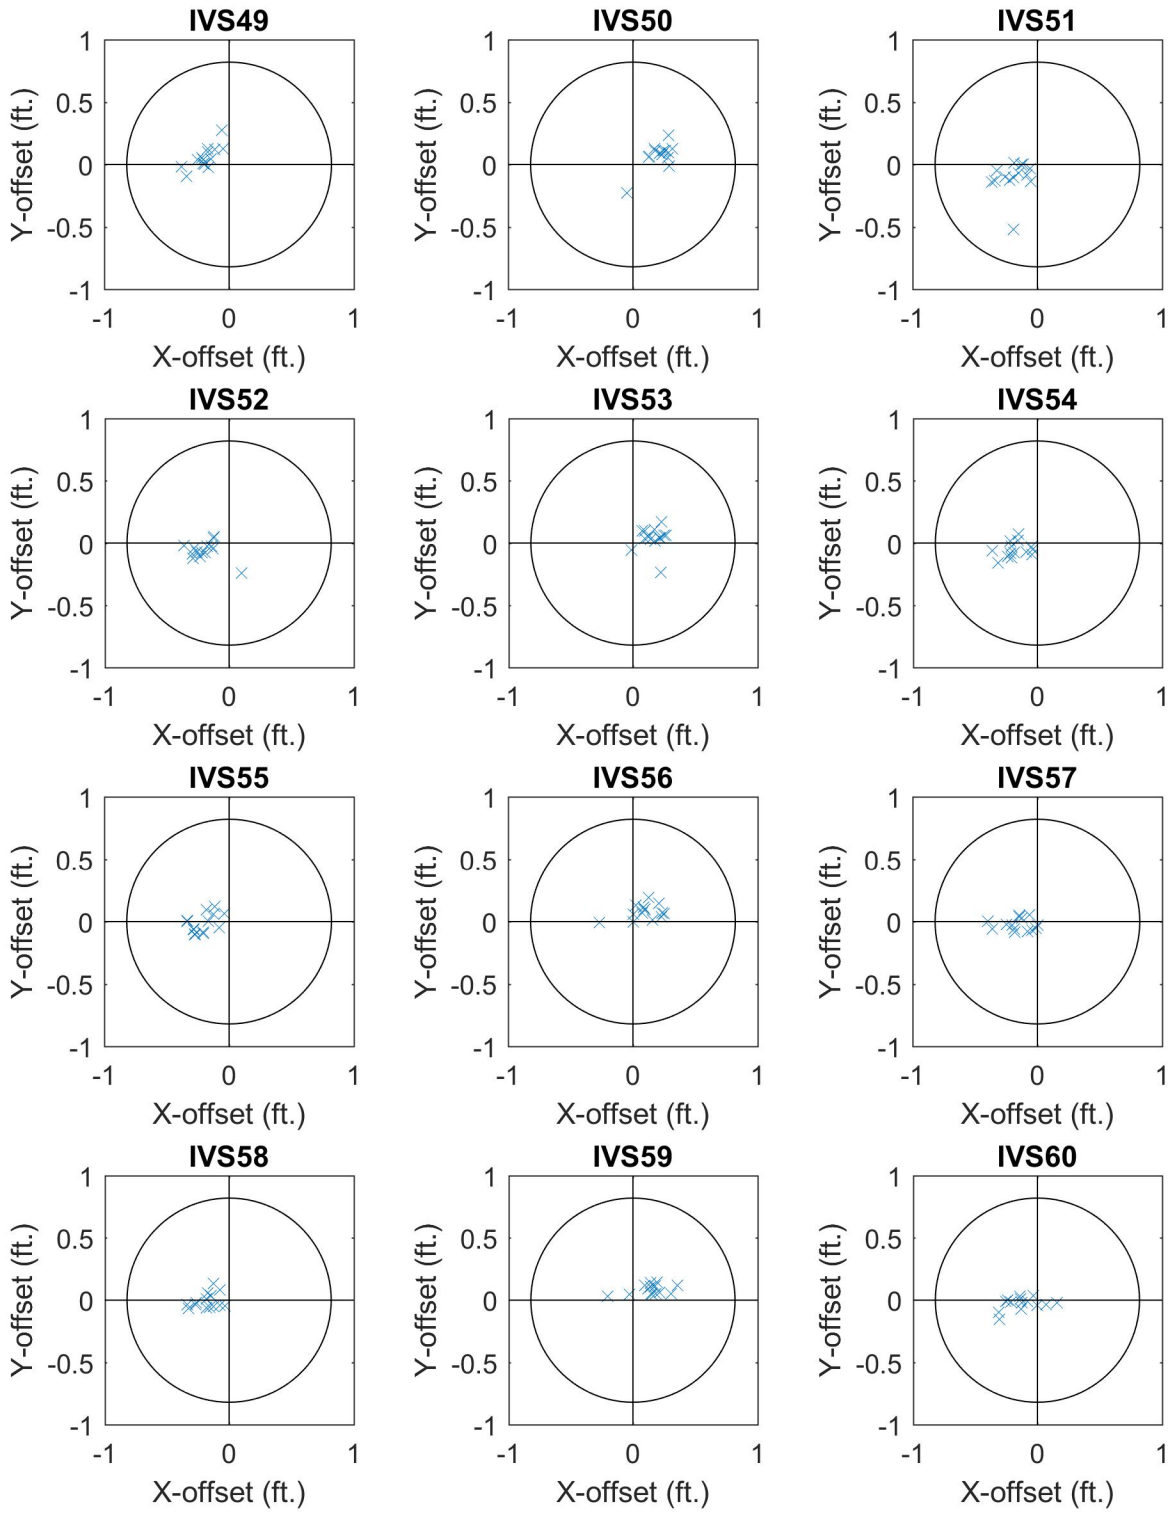

Figure 4. Daily Impossible Canyon fuel break IVS positioning results for each day of DGM data collection. Blue X's show the offset between picked DGM anomaly and the IVS ground truth. Black circle shows the maximum acceptable offset (0.82 ft.) established in WS #22 of the UFP-QAPP.

6.0 TABLES

Data Type	Data Quality Indicator (DQI)	QC Sample and/or Activity to Assess Measurement Performance	Measurement Quality Objective (MQO)	Frequency	Consequence of Failure (a)
Cable Shake Test	Sensitivity	Instrument Response Tests at the IVS	Cable shake test: 98% of response values will not excseed +/- 2 mV when system cables are moved (for all EM61MK2 channels)	Once Daily (AM)	Do not proceed with DGM field activities until failure is resolved and cable shake test has passed.
Personnel Test	Sensitivity	Instrument Response Tests at the IVS	Personnel test (PP): 98% of response values (due to proximity of data collection personnel) will not exceed +/- 2 mV (for all EM61MK2 channels).	Once Daily (AM)	Do not proceed with DGM field activities until failure is resolved and personnel test has passed.
Tow Vehicle Test	Sensitivity	Instrument Response Tests at the IVS	Tow vehicle test (towed array): 98% of response values (due to elevated two vehicle RPM) will not exceed +/- 2 mV (for all EM61MK2 channels).	Once Daily (AM)	Do not proceed with DGM field activities until failure is resolved and tow vehicle test has passed.
Static repeatability (instrument functionality) (b)	Accuracy/Precision	Instrument Response Tests at the IVS	98% of the daily static background response values (no test object) will not exceed +/- 2 mV of expected baseline response (for all EM61MK2 channels). (d) 98% of the response values to the standard spike test item (a small ISO fixed at an orientation and distance from the sensor to provide an approximately 100 mV response on channel 2 of the EM61MK2) will not exceed +/- 10% of the expected baseline response (for all EM61MK2 channels). (d)	Twice Daily (AM/PM)	If failure occurs during the AM static test, do not proceed with DGM field activities until failure is resolved and AM static test(s) have passed. If failure occurs during PM static test, the day's data fails unless BSI is mapped that day with repeatable anomaly characteristics (see dynamic detection repeatability (GSV blind seeding)).

Along track sampling	Completeness	DGM Data Set or Grid	98% <= 0.65 ft. (20 cm)	By grid or dataset (c)	Submittal fails.
Coverage	Completeness	DGM using GPS Positioning: DGM Data Set or Grid	Category A (towed array): A lane spacing of 2 ft is to be used for the twoed array. 95% (or greater) of the lane spacing is to be at the project design lane spacing of 2 ft. 100% of the lane spacing is to be at 3 ft. No unexplained data gaps. Category B (towed array): A lane spacing of 2 ft is to be used for the towed array. 95% (or greater) of the lane spacing is to be at the project design lane spacing of 2 ft. 98% (or greater) of the lane spacing is to be at 3 ft.	By grid or dataset (c)	Data gaps must be filled in before submittal is accpted.
Dynamic detection repeatability (IVS)	Accuracy/Precision	Instrument Response Tests at the IVS	98% of the dynamic background response values during the daily IVS survey will not exceed +/- 3 mV of expected baseline response (for all EM61MK2 channels). (d) Instrument response to each IVS item will be within +/- 25% or +/- 2 mV(whichever is greater) of the expected baseline response (for all EM61MK2 channels). The baseline response for each IVS item will be the average of the instrument responses to that item measured during the first week of IVS surveys. (d)	Twice Daily (AM/PM)	If failure occurs during the AM IVS test, do not proceed with DGM field activities until failure is resolved and AM dynamic IVS test(s) have passed. If failure occurs during PM IVS test, the day's data fails unless BSI is mapped that day with repeatable anomaly characteristics (see Dynamic Detection Repeatability (GSV blind seeding)).
Dynamic detection repeatability (GSV blind seeding)	Sensitivity/Accuracy/Precision/Completeness	DGM Data Set or Grid	All BSIs must be located. Peak response >75% of maximum expected BSI response. (d)	1 per day per team (# per acre to be based on production rate)	Submittal fails.

Dynamic positioning repeatability (IVS)	Accuracy/Precision	Instrument Response Tests at the IVS	Position offset of IVS targets < 25 cm.	Twice Daily (AM/PM)	If failure occurs during the AM IVS test, do not proceed with DGM field activities until failure is resolved and AM dynamic IVS test(s) have passed. If failure occurs during PM IVS test, the day's data fails unless BSI is mapped that day with repeatable anomaly characteristics (see Dynamic Positioning Repeatability (GSV blind seeding)).
Dynamic positioning repeatability (GSV blind seeding)	Sensitivity/Accuracy/Precision/Completeness	DGM Data Set or Grid	90% positioning offset is <= 25 cm + 1/2 line/sensor spacing and 100% is <= 35 cm + 1/2 line/sensor spacing for digital positioning systems. For Towed Array DGM using 2 ft line spacing (Category A and Category B) and RTK-GPS: 90% <= 22 inches 100% <= 26 inches	1 per team per day (# per acre to be based on production rate - same as dynamic detection repeatability (GSV blind seeding)).	Submittal fails.
Velocity	Completeness	DGM Data Set or Grid	95% of all geophysical measurements with the EM61MK2 will be collected at a speed not to exceed 4 miles per hour (1.8 meters per second)	By grid or dataset (c)	Submittal fails.
Target Selection	Completeness	DGM Data Set or Grid	All dig list targets are selected according to project design as detailed in the SSWP	By grid or dataset (c)	Submittal fails.
Geodetic equipment functionality	Accuracy/Precision	GPS Function check at IVS	GPS position checks will not exceed +/- 3 inches (7.6 cm) from the established baseline position.	Once Daily (AM)	Do not proceed with DGM field activities until failure is resolved and positional check has passed.

Geodetic accuracy	Accuracy/Precision	GPS Function Check of Positional monuments used for RTK-GPS base station(s)	Project control points that are used more than once must be repeatable to within 5 cm (e).	For points used more than once, occupation will be repeated (f) for each point used, either monthly (for frequently used points) or before re-use (if used infrequently) (g).	Reset points not located at original locations or resurvey point.
Verify Field Work Methods	Accuracy/Precision	QC Geophysicist will monitor field team work methods.	Verify work methods are being performed in accordance with MEC QAPP, SOPs, and SSWP.	Daily	Stop work. Generate an RCA, CAR, and CAP (as necessary). Implement corrective actions.
DGM Data Reprocessing	Sensitivity/Accuracy/Precision/Completeness	10% of DGM Data Set or Grid	DGM data will be reprocessed by the QC Geophysicist in accordance with GEO SOP 8 (Geophysical QC).	Daily	Stop work. Generate an RCA, CAR, and CAP (as necessary). Implement corrective actions.

Table 1. DGM MQO table for the towed array system.

(a) All failures require an RCA.

(b) Duration of data collection is 1 minute for background, 1 minute for spike and 1 minute for second background measurement. All static repeatability is to be compared to original readings to ensure instrument is consistent throughout the project.

(c) The terms grid and dataset refer to logical groupings of data or data collection event. Logical groupings of data are contiguous areas mapped by the same instrument and in the same relative timeframe. These can be grids, acres, or some other unit of area. A data collection event is similar to logical groupings of data but refers to data collected over a contiguous timeframe, such as morning, afternoon, battery life, or some other measure of contiguous time.

(d) For static background, the expected baseline mV response is to be based on an average of all the static background readings collected during the first four days (or first week). For static spike the expected baseline peak mV response is to be based on an average of all the static spike readings collected during the first four days (or first week). For the IVS background, the expected baseline mV response is to be based on an average of all the IVS background readings for the first four days (or first week). For the IVS spike, the expected baseline mV response is to be based on an average of all the IVS spike readings for the first four days (or first week). For GSV BSI items the baseline mV response will be determined by recording an additional survey line that is offset ½ of the planned survey line spacing (1 ft) from the center of the seeded IVS line. This offset line will be recorded twice daily (am/pm) during the first four days (or first week) of DGM operation with the PP system(s) and the baseline mV response to be used for BSIs (for PP and towed array systems) will then be calculated by averaging all of the peak readings for each ISO at this 1 ft offset. Note that separate baselines will be generated and used for the PP and towed-array system static and IVS tests.

(e) GPS base station coordinates that are currently being used are provided by USACE/BRAC.

(f) Repeat occupation means demonstrate the control points being used can be recovered and reoccupied and that they have not moved more than the requirement specification. This can be accomplished using the same methodology used to initially tie the local network to a HARN, CORS, OPUS, or other recognized network, or it can be accomplished by other means that achieve this requirement.

(g) An example of frequently used control points would be points used as RTK DGPS base stations. Infrequently used points could be those used during GPS operations where the control point was used during mapping and then again at some later time for reacquisition and QC statistical sampling. Infrequently used points also could include grid corners; they are used for line and fiducial positioning and then reused for reacquisition or QC statistical sampling.

Note: Although it is highly unlikely, should an area originally categorized and seeded for Category B (i.e. seeded for DGM at a rate of approximately 1 Blind Seed Item (BSI) for every 4 acres and not planned for intrusive investigation) then be upgraded to Category A after DGM has been completed (i.e. should be seeded at a rate of 1 BSI per dig team per day and planned for intrusive investigation), that if the dig team does not have 1 BSI per dig team per day that this would not constitute a QC failure because the density of BSIs installed would have been based on the original selection of this area as Category B. The rationale for stating this scenario is that once the DGM data has been collected, it is impossible to add additional BSIs (i.e. add additional anomalies to the previously collected DGM data). If this scenario does occur, it has been identified in the QAPP and discussed in relation to QC objectives and their pass/fail criteria.

Seed ID	Grid	Reported Sum Response (mV)	Response Passes?	Total Offset (in)	Positioning Passes?
IC007G	IC033	250.11	Yes	7.12	Yes
IC006G	IC048	410.74	Yes	11.52	Yes
IC008G	IC078	231.79	Yes	14.81	Yes
IC009G	IC088	640.02	Yes	17.37	Yes

Table 3. QA DGM target picks and recovered items. NA entries in the Depth Recovered column for No Finds and Terrain indicate that the >14 mV anomaly was not present when reacquisition procedures were conducted (e.g. anomaly was likely due to instrument noise). For hot rocks, the target locations were dug until instrument reading was below 14 mV on summed channels, but no depth of investigation was recorded.

1.0 Mercury Road

1.1 Site Location

Mercury Road runs roughly east-west and is located in the southeastern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Mercury Road is shown on Figure ME1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Mercury Road permanent fuel break from 1997 through 2020. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 228 MEC items [two Discarded Military Munitions (DMM), 226 Unexploded Ordnance (UXO)] were removed from the Mercury Road fuel break. These MEC items are shown on Figure ME2 and are listed in Table 1. Table 2 lists MEC operations performed within the Mercury Road fuel break.

USA Environmental conducted MEC remediation field work within the Mercury Road fuel break in 1997. Parsons Environmental conducted MEC remediation field work within the Mercury Road fuel break from 2001 through 2005. Gilbane conducted MEC remediation field work within the Mercury Road fuel break from 2012 through 2014. KEMRON Environmental Services, Inc. conducted MEC remediation field work within the Mercury Road fuel break in 2018 and 2020. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

No areas of special note are documented for Mercury Road.

2.3 Conclusion

MEC remediation has been completed within the Mercury Road fuel break.

Tables

Figure NR2 Nowhere Road Fuel Break Road

Figure NR3 Nowhere Road Fuel Break Road

1.0 Nowhere Road

1.1 Site Location

Nowhere Road runs roughly east-west and is located in the western portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Nowhere Road is shown on Figure NR1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Nowhere Road fuel break from 1997 through 2020. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 26 MEC items [26 Unexploded Ordnance (UXO)] were removed from the Nowhere Road fuel break. These MEC items are shown on Figures NR2 through NR3 and are listed in Table 1. Table 2 lists MEC operations performed within the Nowhere Road fuel break.

USA Environmental conducted MEC remediation field work within the Nowhere Road fuel break in 1997. Parsons Environmental conducted MEC remediation field work within the Nowhere Road fuel break in 2001. Gilbane conducted MEC remediation field work within the Nowhere Road fuel break from 2011 through 2014. KEMRON Environmental Services, Inc. conducted MEC remediation field work within the Nowhere Road fuel break from 2016 through 2020. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

The central portion of Nowhere Road in Unit 10 was rerouted to avoid an area subject to frequent water inundation (flooding) during the fall and winter. This area is shown on Figure NR2.

2.3 Conclusion

MEC remediation has been completed within the Nowhere Road fuel break. As noted above, the central portion of Nowhere Road in Unit 10 was rerouted to avoid an area subject to frequent water inundation (flooding).

Figure OR2 Orion Road Fuel Break Road

Figure OR3 Orion Road Fuel Break Road

1.0 Orion Road

1.1 Site Location

Orion Road runs roughly north-south and is located in the central portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Orion Road is shown on Figure OR1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Orion Road fuel break from 2001 through 2020. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 142 MEC items [one Discarded Military Munitions (DMM), 141 Unexploded Ordnance (UXO)] were removed from the Orion Road fuel break. These MEC items are shown on Figures OR2 through OR3 and are listed in Table 1. Table 2 lists MEC operations performed within the Orion Road fuel break.

Parsons Environmental conducted MEC remediation field work within the Orion Road fuel break from 2001 through 2005. Shaw conducted MEC remediation field work within the Orion Road fuel break from 2009 through 2011. Gilbane conducted MEC remediation field work within the Orion Road fuel break from 2011 through 2014. KEMRON Environmental Services, Inc. conducted MEC remediation field work within the Orion Road fuel break in 2018 and 2020. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

The center portion (approximately 15 feet wide) of Orion Road south of Mercury Road contains varying levels of asphalt through which subsurface anomalies were not investigated. Either anomalies in these sections should be investigated and removed, or construction support should be required during any intrusive activities in this area. The supplemental subsurface MEC removal is not entirely complete, and a list of the uninvestigated targets is provided in Volume 2.

The northern end of the Orion Road fuel break where it intersects with Eucalyptus Road was realigned after the MEC removal in Unit 18 was conducted by Shaw. The realigned grids (shown in Figure OR3 as PE063 and PE064) are part of the Range 42 pad area that was identified for future habitat restoration. As part of the remedial action in Unit 18, subsurface MEC remediation activities were initiated in the future habitat restoration area. Excavation of 998 of approximately 3,200 DGM anomalies resulted in no MEC items being encountered. These excavations uncovered mostly general trash with some MD and RRD. The area was determined as a low-probability MEC area. Portions of the area received subsurface removal, other areas were bulldozed in preparation for restoration activities following determination of the area as having a low probability of encountering MEC. As part of the initial habitat restoration activities, ripping of the soil to a depth of approximately 18 inches was completed using construction support. No MEC or MEC-like items were encountered. This work is described in *Final MRS-BLM Units 18 and 22, Munitions and Explosives of Concern Remedial Action Report, Former Fort Ord, California* (OE-0721B).

2.3 Conclusion

MEC remediation has been completed within the Orion Road fuel break. As noted above, in the center portion of Orion Road south of Mercury Road, either construction support should be present during intrusive activities or further MEC remediation should be performed prior to allowing these activities. Although there are supplemental targets that were not investigated, this does not affect the use of the road as a fuel break and associated routine maintenance (e.g. vegetation cutting along the roadside).

Figure OS1 Oscar Road Overview

Figure OS2 Oscar Road Fuel Break Road

1.0 Oscar Road

1.1 Site Location

Oscar Road runs roughly north-south and is located in the northern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Oscar Road is shown on Figure OS1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Oscar Road fuel break from 2003 through 2005. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 24 MEC items [23 Unexploded Ordnance (UXO), one Insufficient Data (ISD)] were removed from the Oscar Road fuel break. These MEC items are shown on Figures OS2 and are listed in Table 1. Table 2 lists MEC operations performed within the Oscar Road fuel break.

Parsons Environmental conducted MEC remediation field work within the Oscar Road fuel break from 2003 to 2005. KEMRON conducted analog subsurface removal in five partial grids (identified in Figure OS2) in 2019 to provide for 45-ft wide area of subsurface removal throughout the Oscar Road fuel break. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

No areas of special note are documented for Oscar Road.

2.3 Conclusion

MEC remediation has been completed within the Oscar Road fuel break.

Figure PH1 Phoenix Road Overview

Figure PH2 Phoenix Road Fuel Break Road

1.0 Phoenix Road

1.1 Site Location

Phoenix Road runs roughly east-west and is located in the western portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Phoenix Road is shown on Figure PH1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Phoenix Road fuel break from 1997 through 2014. Both analog and digital equipment were used to conduct MEC removal. During this work a total of five MEC items [five Unexploded Ordnance (UXO)] were removed from the Phoenix Road fuel break. These MEC items are shown on Figure PH2 and are listed in Table 1. Table 2 lists MEC operations performed within the Phoenix Road fuel break.

USA Environmental conducted MEC remediation field work within the Phoenix Road fuel break in 1997. Parsons Environmental conducted MEC remediation field work within the Phoenix Road fuel break from 2001 to 2005. Gilbane conducted MEC remediation field work within the Phoenix Road fuel break in 2014. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

No areas of special note are documented for Phoenix Road.

2.3 Conclusion

MEC remediation has been completed within the Phoenix Road fuel break.

Figure RI1 Riso Ridge Overview

Figure RI2 Riso Ridge Fuel Break Road

1.0 Riso Ridge

1.1 Site Location

Riso Ridge runs roughly north-south and is located in the eastern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Riso Ridge is shown on Figure RI1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) remediation was performed in a variety of phases within the Riso Ridge fuel break from 2000 through 2020. Both analog and digital equipment were used to conduct MEC remediation. During this work a total of 109 MEC items [one DMM, 108 Unexploded Ordnance (UXO)] were removed from the Riso Ridge fuel break. These MEC items are shown on Figure RI2 and are listed in Table 1. Table 2 lists MEC operations performed within the Riso Ridge fuel break.

Parsons Environmental conducted MEC remediation field work within the Riso Ridge fuel break from 2001 to 2005. Shaw Environmental conducted MEC remediation field work within the Riso Ridge fuel break in 2010. Gilbane conducted MEC remediation field work within the Riso Ridge fuel break in from 2012 through 2014. KEMRON conducted MEC remediation field work within the Riso Ridge fuel break from 2017 through 2020. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

No areas of special note are documented for Riso Ridge.

2.3 Conclusion

MEC remediation has been completed within the Riso Ridge fuel break.

1.0 Watkins Gate Road

1.1 Site Location

Watkins Gate Road runs roughly east-west and is located in the central portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Watkins Gate Road is shown on Figure WG1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) removal was performed in a variety of phases within the Watkins Gate Road fuel break from 1997 through 2019. Both analog and digital equipment were used to conduct MEC removal. During this work a total of 25 MEC items [two Discarded Military Munitions (DMM), 23 Unexploded Ordnance (UXO)] were removed from the Watkins Gate Road fuel break. These MEC items are shown on Figures WG2 through WG3 and are listed in Table 1. Table 2 lists MEC operations performed within the Watkins Gate Road fuel break.

USA Environmental conducted MEC remediation field work within the Watkins Gate Road fuel break in 1997 and 1998. Parsons Environmental conducted MEC remediation field work within the Watkins Gate Road fuel break from 2001 through 2005. KEMRON conducted MEC remediation field work within the Watkins Gate Road fuel break from 2017 through 2019. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

No areas of special note are documented for Watkins Gate Road. The supplemental subsurface MEC removal is not entirely complete, and a list of the uninvestigated targets is provided in Volume 2.

2.3 Conclusion

MEC remediation has been completed within the Watkins Gate Road fuel break. Although there are supplemental targets that were not investigated, this does not affect the use of the road as a fuel break and associated routine maintenance (e.g. vegetation cutting along the roadside).

Tables

Appendix A Quality Assurance Report: Digital Geophysical Operations

1.0 Wildcat Ridge

1.1 Site Location

Wildcat Ridge runs roughly north-south and is located in the eastern portion of the Impact Area Munitions Response Area (MRA) at the former Fort Ord. Wildcat Ridge is shown on Figure WR1.

2.0 MEC Remediation

2.1 Summary of MEC Remediation

Munitions and Explosives of Concern (MEC) remediation was performed in a variety of phases within the Wildcat Ridge fuel break from 2001 through 2019. Both analog and digital equipment were used to conduct MEC remediation. During this work a total of eight MEC items [four Discarded Military Munitions (DMM), four Unexploded Ordnance (UXO)] were removed from the Wildcat Ridge fuel break. These MEC items are shown on Figure WR2 and are listed in Table 1. Table 2 lists MEC operations performed within the Wildcat Ridge fuel break.

Parsons Environmental conducted MEC remediation field work within the Wildcat Ridge fuel break in 2001. Gilbane conducted MEC remediation field work within the Wildcat Ridge fuel break in 2012 and 2013. KEMRON conducted MEC remediation field work within the Wildcat Ridge fuel break in 2018 and 2019. A Quality Assurance Report for the geophysical data collected by KEMRON is provided in Appendix A. MEC remediation performed by contractors other than KEMRON was conducted under separate prior contracts.

2.2 Areas of Special Note

No areas of special note are documented for Wildcat Ridge.

2.3 Conclusion

MEC remediation has been completed within the Wildcat Ridge fuel break.

1.0 INTRODUCTION

This report covers the Quality Assurance (QA) processes conducted by the U.S. Army Corps of Engineers (USACE) with respect to the collection, processing, and evaluation of digital geophysical data collected by KEMRON Environmental Services, Inc (KEMRON). The field work was performed in Wildcat Ridge fuel break. Work was performed under WERS contract No. W912DY-10-D-0027, Site-Specific Work Plan (Shaw, 2010) and FWVs as described in Impact Area MRA TIP (KEMRON, 2020). The field protocols, database management, and QA reviews were based on a combination of methods previously used in other units and described in the UFP-QAPP Volume II Appendix A (KEMRON, 2016a), along with additional procedures necessary for ensuring compliance with the WERS MMRP contract and the standard operating procedures performed by KEMRON's subcontractors GILBANE and NAEVA. USACE QA verified that KEMRON had an adequate Quality Control (QC) program in place and that data collected in Wildcat Ridge fuel break were in accordance with project Data Quality Objectives (DQOs) and Measurement Quality Objectives (MQOs), as established in the UFP-QAPP (KEMRON, 2016a). Wildcat Ridge fuel break DGM data were collected in their entirety to meet Category A spacing.

1.1 Site details

Wildcat Ridge fuel break runs roughly north-south and is located in the eastern portion of the Impact Area Munitions Response Area (MRA), as depicted in Figure 1.

Clean-up operations pertinent to DGM activities are described in Impact Area MRA TIP (KEMRON, 2020).

According to the Installation-Wide Multispecies Habitat Management Plan (HMP) for Fort Ord (USACE, 1997), the site will be used as an undeveloped habitat reserve. The Impact Area is mostly covered by maritime chaparral and grassland habitats. The terrain in the Impact Area is dominated by rolling hills with elevations ranging from 720-900 ft. above sea level (ASL). These hills are composed of sand associated with Pleistocene aged sand dunes that may be as thick as 250 ft.

2.0 QA ACTIVITES

2.1 Data Collection Methods

Production geophysical data were collected using Geonics EM-61MKII electromagnetic sensors in a multi-coil configuration (towed array) throughout the Wildcat Ridge fuel break. The EM-61MKII is a time-domain electromagnetic sensor that generates an electromagnetic pulse, inducing eddy currents within the subsurface. During the off period of the EM pulse, the eddy current decay produces secondary electromagnetic fields within both ferrous and non-ferrous metallic objects. These secondary electromagnetic fields are received and recorded over four averaged time gates per data collection interval (10Hz).

Data were collected either as individual grids or in grid blocks of variable size consisting of multiple grids. All data collected met Category A line spacing requirements, with 95% not to exceed a lane spacing of 2 ft. and 100% not to exceed a lane spacing of 3 ft.

Obstacles and issues with terrain precluded 100% coverage and approximately 0.66 acres of the Wildcat Ridge fuel break were either inaccessible due to erosion or determined by the UXO Safety to be inaccessible to DGM survey due to steep terrain. All data gaps were appropriately documented in the obstacle files submitted with DGM packages. Figure 1 of this QA report depicts the full DGM dataset for the Wildcat Ridge fuel break.

The Wildcat Ridge fuel break was identified for subsurface removal. Following completion of subsurface removal in the roads, the USACE collected a minimum of 3-5% QA DGM data over the intrusive investigation areas post-excavation to confirm no anomalies remain. A total of 1 target was picked from the QA DGM survey. The USACE OESS and geophysicist investigated the target to a depth of 4' below ground surface without resolving the anomaly below the detection threshold and the target was categorized as a no find. The results of these surveys are given in Figure 2 and Table 2. All fuel break segments passed QA inspection.

2.2 Field Oversight

Field oversight was performed intermittently throughout the project by both the USACE Project Geophysicist and the OESS. Appropriate field procedures were reviewed and found to be in compliance. Under the WERS Contract No. W912DY-10-D-0027, NAEVA is subcontracted to collect the geophysical data.

2.3 Geophysical System Verification

Under the WERS contract, USACE and KEMRON fully incorporated the physics based Geophysical System Verification (GSV) approach as described in the July 2009 ESTCP report (ESTCP, 2009) and supported by EM 200-1-15. GSV includes two methods for providing QA/QC: blind seeding and the instrument verification strip (IVS). IVS data results were recorded on daily QC submittals attached as PDF files to the grid blocks. Data were reviewed by the QA Geophysicist to ensure all MQOs were achieved. The QA data review process is described in section 2.4 and a summary of MQOs for towed array DGM operations are given in Table 1. Daily IVS test results for towed array DGM in the Wildcat Ridge fuel break are shown in Figures 3-4. Further details regarding MQOs are provided in the UFP-QAPP (KEMRON, 2016a).

Production data required the GSV blind seeds placed throughout the Wildcat Ridge fuel break, as documented in the UFP-QAPP (KEMRON, 2016a). By placing blind seeds at an average rate of one per day, the instrument functionality can be tested on a daily basis. Any failures to detect a blind seed could be indicative of an issue with data collection. All blind

seeds were small industry standard objects buried at six inches below ground surface. The blind seeds were placed by the QC Geophysicist. All blind QC seeds were detected and both the responses and positioning were within the requirements of the MQOs and SOPs. No blind seeds were placed in the Wildcat Ridge fuel break due to the small size of the survey area. However, the towed array did encounter a blind seed on Impossible Canyon Road during the same day of survey and passed all MQOs.

2.4 Digital Data Review

A review of digital geophysics data by the USACE was performed to monitor the effectiveness of data processing and consistency of data delivery. Issues that were reviewed in these data included:

1) Missing survey lines within a grid (interline gaps)
2) Point-to-point data gaps along survey lines
3) Bowing out of survey lines beyond 50% of survey line spacing, unless otherwise collected
4) Unreasonable data "spikes"
5) Data incongruity across survey grids (Data levels in one grid are not reasonably compatible with data levels in neighboring grids)
6) Inadequate data density along survey traverse
7) Lack of accurate, precise locations; survey line orientation
8) Inadequate/incomplete site survey coverage
9) Missing, incomplete, or noncompliant instrument standardization checks
10) Completeness of file header information and supporting documentation
11) Consistent IVS and GSV results supporting the data quality objectives

To accomplish this, all raw and processed data files were checked by the USACE to ensure that KEMRON followed an appropriate and informative naming convention reflecting the grids surveyed as outlined in the EM 200-1-15. The USACE checked that KEMRON managed the field and processed data in a professional manner, including organization, daily maintenance, and complete documentation. This focused on a review of header files on the pre-processed data (data that has been merged into a single file and synchronized with the GPS data) and processed data to verify that dates were consistent, systems and system sampling parameters were identified, project name and contractor was listed, and all column headers were included and defined. KEMRON also delivered supporting summary sheets that further documented field parameters and processing. All of the summary sheets were reviewed for completeness, verification of calibration data, and consistency to the electronic data file headers.

In order to make the above process more efficient, a grid tracking spreadsheet located in the Wildcat Ridge fuel break folder on the FTP site was updated weekly and allowed for the QC Geophysicist and USACE QA Geophysicist to document their verification of each deliverable. Minor issues such as corrupt or incomplete zip files were addressed within the

table and via QC report deliverables. The final excel file will be maintained within the Final Data Submittal QC folder on the Fort Ord server.

The procedure for reprocessing and projecting the pseudo-color maps of the DGM data included starting with a 100% review of the data in Geosoft Oasis Montaj to include re-leveling and re-gridding. These digital data were imported into Geosoft for the generation of pseudo-color maps that were then exported as a georeferenced geotiff.

Overall, the general QA digital data review consisted at a minimum of:

1) Creating a processed database
2) Importing XYZ data
3) Calculation of sum channel
4) Generating a grid (0.25 ft. cell size and blanking distance of 2 ft.) of sum channel
5) Plotting the sum channel
6) Plotting a symbol cover for the track lines (view coverage)
7) Exporting the plots to geotiffs
8) Importing the geotiffs into a GIS

2.5 Discussion

No issues were identified during data review and no corrective action was issued.

3.0 CONCLUSIONS

QA activities by the Government verified KEMRON had an adequate QC program in place and that data collected within the Wildcat Ridge fuel break are sufficient and in accordance with the project DQOs and MQOs. All dynamic DGM data in the Wildcat Ridge fuel break meet Category A standards.

Figure 2

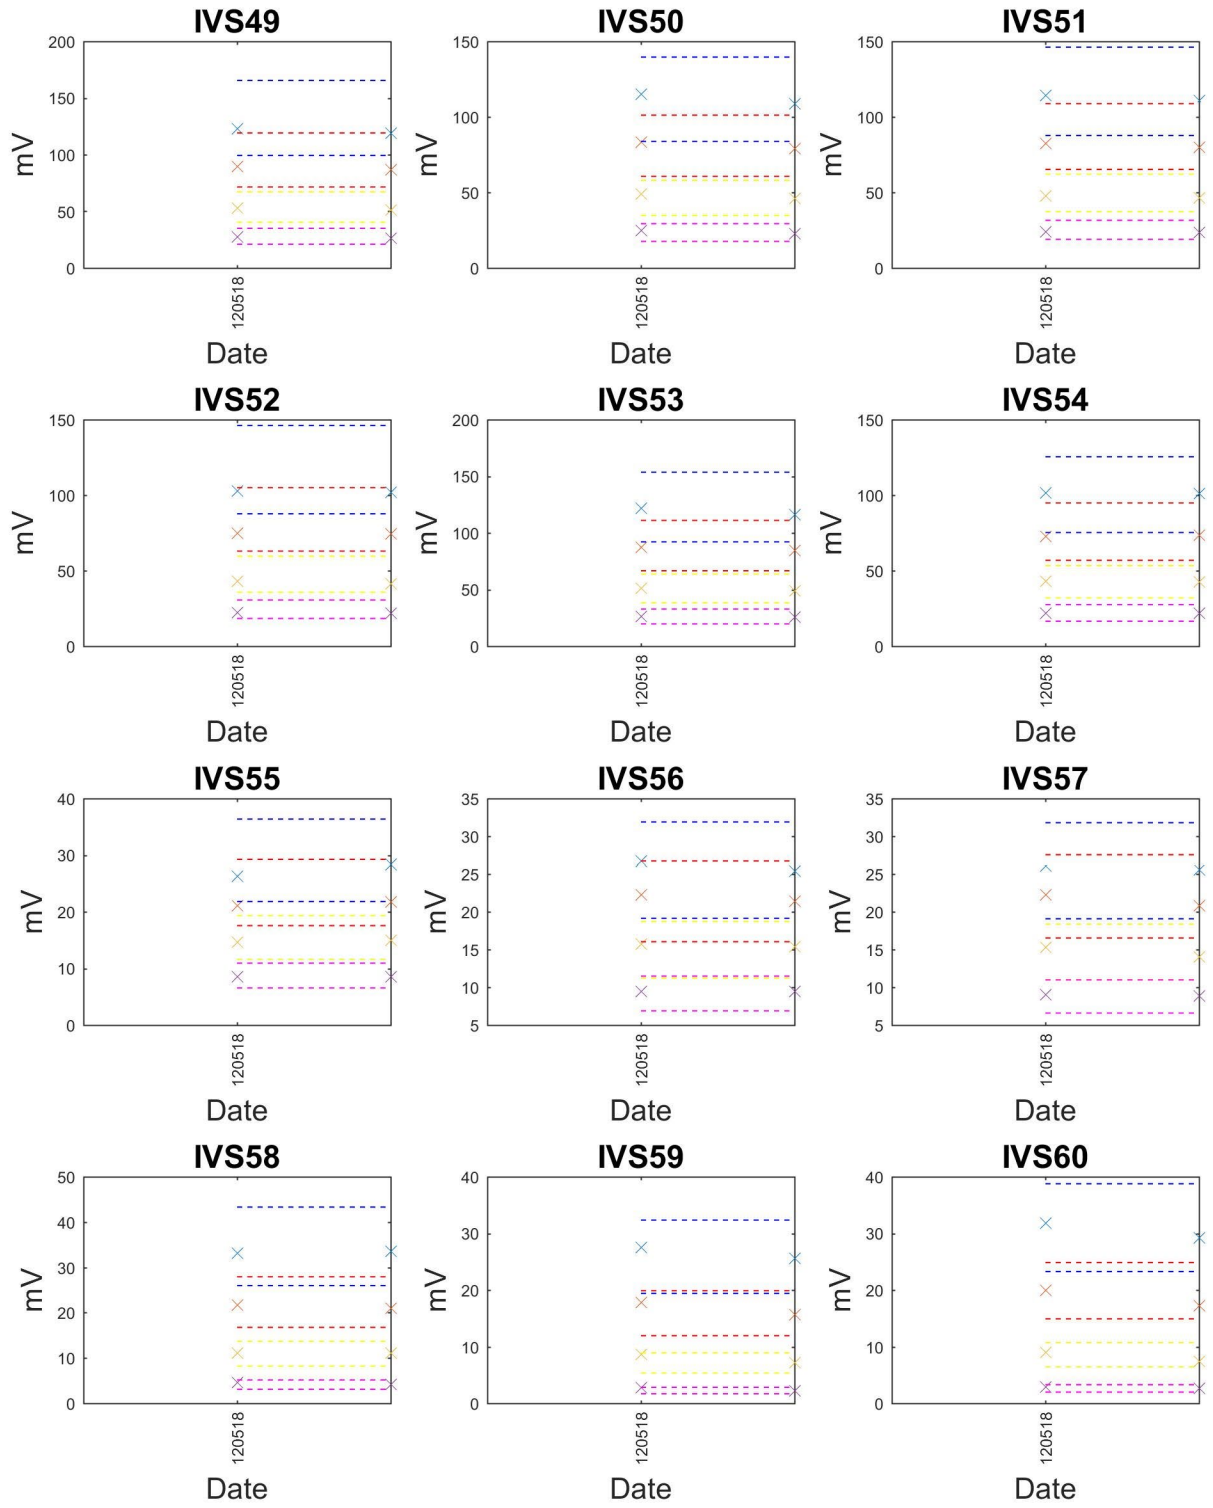

Figure 3. DGM response of Wildcat Ridge fuel break IVS items for each day of DGM data collection. X symbols represent peak anomaly response for channel 1 (blue), channel 2 (red), channel 3 (yellow), and channel 4 (purple) for each IVS item. Dashed lines represent the allowable variability (+/- 25% of predicted response) established in WS #22 of the UFP-QAPP.

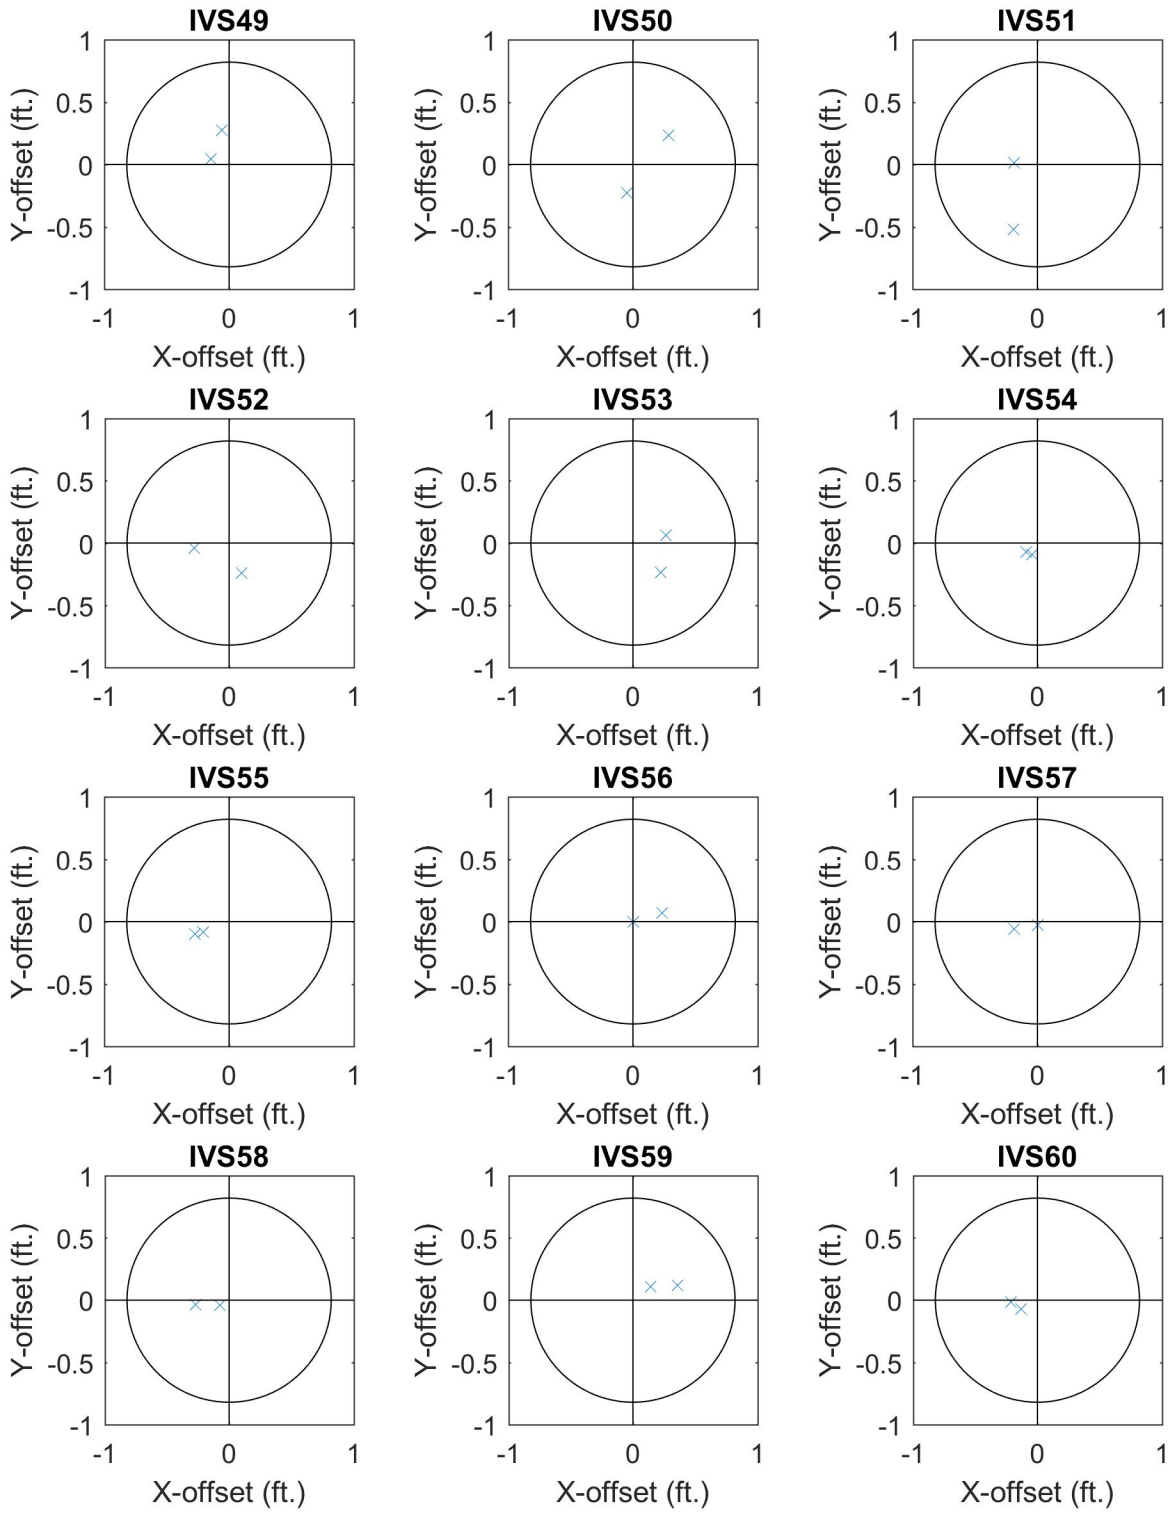

Figure 4. Daily Wildcat Ridge fuel break IVS positioning results for each day of DGM data collection. Blue X's show the offset between picked DGM anomaly and the IVS ground truth. Black circle shows the maximum acceptable offset (0.82 ft.) established in WS #22 of the UFP-QAPP.

6.0 TABLES

Data Type	Data Quality Indicator (DQI)	QC Sample and/or Activity to Assess Measurement Performance	Measurement Quality Objective (MQO)	Frequency	Consequence of Failure (a)
Cable Shake Test	Sensitivity	Instrument Response Tests at the IVS	Cable shake test: 98% of response values will not excseed +/- 2 mV when system cables are moved (for all EM61MK2 channels)	Once Daily (AM)	Do not proceed with DGM field activities until failure is resolved and cable shake test has passed.
Personnel Test	Sensitivity	Instrument Response Tests at the IVS	Personnel test (PP): 98% of response values (due to proximity of data collection personnel) will not exceed +/- 2 mV (for all EM61MK2 channels).	Once Daily (AM)	Do not proceed with DGM field activities until failure is resolved and personnel test has passed.
Tow Vehicle Test	Sensitivity	Instrument Response Tests at the IVS	Tow vehicle test (towed array): 98% of response values (due to elevated two vehicle RPM) will not exceed +/- 2 mV (for all EM61MK2 channels).	Once Daily (AM)	Do not proceed with DGM field activities until failure is resolved and tow vehicle test has passed.
Static repeatability (instrument functionality) (b)	Accuracy/Precision	Instrument Response Tests at the IVS	98% of the daily static background response values (no test object) will not exceed +/- 2 mV of expected baseline response (for all EM61MK2 channels). (d) 98% of the response values to the standard spike test item (a small ISO fixed at an orientation and distance from the sensor to provide an approximately 100 mV response on channel 2 of the EM61MK2) will not exceed +/- 10% of the expected baseline response (for all EM61MK2 channels). (d)	Twice Daily (AM/PM)	If failure occurs during the AM static test, do not proceed with DGM field activities until failure is resolved and AM static test(s) have passed. If failure occurs during PM static test, the day's data fails unless BSI is mapped that day with repeatable anomaly characteristics (see dynamic detection repeatability (GSV blind seeding)).

Along track sampling	Completeness	DGM Data Set or Grid	98% <= 0.65 ft. (20 cm)	By grid or dataset (c)	Submittal fails.
Coverage	Completeness	DGM using GPS Positioning: DGM Data Set or Grid	Category A (towed array): A lane spacing of 2 ft is to be used for the twoed array. 95% (or greater) of the lane spacing is to be at the project design lane spacing of 2 ft. 100% of the lane spacing is to be at 3 ft. No unexplained data gaps. Category B (towed array): A lane spacing of 2 ft is to be used for the towed array. 95% (or greater) of the lane spacing is to be at the project design lane spacing of 2 ft. 98% (or greater) of the lane spacing is to be at 3 ft.	By grid or dataset (c)	Data gaps must be filled in before submittal is accpted.
Dynamic detection repeatability (IVS)	Accuracy/Precision	Instrument Response Tests at the IVS	98% of the dynamic background response values during the daily IVS survey will not exceed +/- 3 mV of expected baseline response (for all EM61MK2 channels). (d) Instrument response to each IVS item will be within +/- 25% or +/- 2 mV(whichever is greater) of the expected baseline response (for all EM61MK2 channels). The baseline response for each IVS item will be the average of the instrument responses to that item measured during the first week of IVS surveys. (d)	Twice Daily (AM/PM)	If failure occurs during the AM IVS test, do not proceed with DGM field activities until failure is resolved and AM dynamic IVS test(s) have passed. If failure occurs during PM IVS test, the day's data fails unless BSI is mapped that day with repeatable anomaly characteristics (see Dynamic Detection Repeatability (GSV blind seeding)).
Dynamic detection repeatability (GSV blind seeding)	Sensitivity/Accuracy/Precision/Completeness	DGM Data Set or Grid	All BSIs must be located. Peak response >75% of maximum expected BSI response. (d)	1 per day per team (# per acre to be based on production rate)	Submittal fails.

Dynamic positioning repeatability (IVS)	Accuracy/Precision	Instrument Response Tests at the IVS	Position offset of IVS targets < 25 cm.	Twice Daily (AM/PM)	If failure occurs during the AM IVS test, do not proceed with DGM field activities until failure is resolved and AM dynamic IVS test(s) have passed. If failure occurs during PM IVS test, the day's data fails unless BSI is mapped that day with repeatable anomaly characteristics (see Dynamic Positioning Repeatability (GSV blind seeding)).
Dynamic positioning repeatability (GSV blind seeding)	Sensitivity/Accuracy/Precision/Completeness	DGM Data Set or Grid	90% positioning offset is <= 25 cm + 1/2 line/sensor spacing and 100% is <= 35 cm + 1/2 line/sensor spacing for digital positioning systems. For Towed Array DGM using 2 ft line spacing (Category A and Category B) and RTK-GPS: 90% <= 22 inches 100% <= 26 inches	1 per team per day (# per acre to be based on production rate - same as dynamic detection repeatability (GSV blind seeding)).	Submittal fails.
Velocity	Completeness	DGM Data Set or Grid	95% of all geophysical measurements with the EM61MK2 will be collected at a speed not to exceed 4 miles per hour (1.8 meters per second)	By grid or dataset (c)	Submittal fails.
Target Selection	Completeness	DGM Data Set or Grid	All dig list targets are selected according to project design as detailed in the SSWP	By grid or dataset (c)	Submittal fails.
Geodetic equipment functionality	Accuracy/Precision	GPS Function check at IVS	GPS position checks will not exceed +/- 3 inches (7.6 cm) from the established baseline position.	Once Daily (AM)	Do not proceed with DGM field activities until failure is resolved and positional check has passed.

Geodetic accuracy	Accuracy/Precision	GPS Function Check of Positional monuments used for RTK-GPS base station(s)	Project control points that are used more than once must be repeatable to within 5 cm (e).	For points used more than once, occupation will be repeated (f) for each point used, either monthly (for frequently used points) or before re-use (if used infrequently) (g).	Reset points not located at original locations or resurvey point.
Verify Field Work Methods	Accuracy/Precision	QC Geophysicist will monitor field team work methods.	Verify work methods are being performed in accordance with MEC QAPP, SOPs, and SSWP.	Daily	Stop work. Generate an RCA, CAR, and CAP (as necessary). Implement corrective actions.
DGM Data Reprocessing	Sensitivity/Accuracy/Precision/Completeness	10% of DGM Data Set or Grid	DGM data will be reprocessed by the QC Geophysicist in accordance with GEO SOP 8 (Geophysical QC).	Daily	Stop work. Generate an RCA, CAR, and CAP (as necessary). Implement corrective actions.

Table 1. DGM MQO table for the towed array system.

(a) All failures require an RCA.

(b) Duration of data collection is 1 minute for background, 1 minute for spike and 1 minute for second background measurement. All static repeatability is to be compared to original readings to ensure instrument is consistent throughout the project.

(c) The terms grid and dataset refer to logical groupings of data or data collection event. Logical groupings of data are contiguous areas mapped by the same instrument and in the same relative timeframe. These can be grids, acres, or some other unit of area. A data collection event is similar to logical groupings of data but refers to data collected over a contiguous timeframe, such as morning, afternoon, battery life, or some other measure of contiguous time.

(d) For static background, the expected baseline mV response is to be based on an average of all the static background readings collected during the first four days (or first week). For static spike the expected baseline peak mV response is to be based on an average of all the static spike readings collected during the first four days (or first week). For the IVS background, the expected baseline mV response is to be based on an average of all the IVS background readings for the first four days (or first week). For the IVS spike, the expected baseline mV response is to be based on an average of all the IVS spike readings for the first four days (or first week). For GSV BSI items the baseline mV response will be determined by recording an additional survey line that is offset ½ of the planned survey line spacing (1 ft) from the center of the seeded IVS line. This offset line will be recorded twice daily (am/pm) during the first four days (or first week) of DGM operation with the PP system(s) and the baseline mV response to be used for BSIs (for PP and towed array systems) will then be calculated by averaging all of the peak readings for each ISO at this 1 ft offset. Note that separate baselines will be generated and used for the PP and towed-array system static and IVS tests.

(e) GPS base station coordinates that are currently being used are provided by USACE/BRAC.

(f) Repeat occupation means demonstrate the control points being used can be recovered and reoccupied and that they have not moved more than the requirement specification. This can be accomplished using the same methodology used to initially tie the local network to a HARN, CORS, OPUS, or other recognized network, or it can be accomplished by other means that achieve this requirement.

(g) An example of frequently used control points would be points used as RTK DGPS base stations. Infrequently used points could be those used during GPS operations where the control point was used during mapping and then again at some later time for reacquisition and QC statistical sampling. Infrequently used points also could include grid corners; they are used for line and fiducial positioning and then reused for reacquisition or QC statistical sampling.

Note: Although it is highly unlikely, should an area originally categorized and seeded for Category B (i.e. seeded for DGM at a rate of approximately 1 Blind Seed Item (BSI) for every 4 acres and not planned for intrusive investigation) then be upgraded to Category A after DGM has been completed (i.e. should be seeded at a rate of 1 BSI per dig team per day and planned for intrusive investigation), that if the dig team does not have 1 BSI per dig team per day that this would not constitute a QC failure because the density of BSIs installed would have been based on the original selection of this area as Category B. The rationale for stating this scenario is that once the DGM data has been collected, it is impossible to add additional BSIs (i.e. add additional anomalies to the previously collected DGM data). If this scenario does occur, it has been identified in the QAPP and discussed in relation to QC objectives and their pass/fail criteria.

EXECUTIVE SUMMARY

To address the possibility of munitions and explosives of concern items remaining in portions of the Impact Area MRA fuel breaks, additional subsurface munitions and explosives of concern removal was recommended in areas within the fuel break system (totaling 25.5 acres) where the following three conditions are met:

- Analog subsurface removal actions performed prior to the Track 3 Record of Decision
- High pre-analog survey anomaly density
- Previously recovered 81mm mortar projectiles

This included portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road.

The supplemental subsurface munitions and explosives of concern removal was conducted primarily by advanced geophysical classification with the MetalMapper 2x2 and subsurface investigation and removal of anomalies classified as potential targets of interest. Two of the fuel break grids, one on Nowhere Road and one on Orion Road, which contained EM61-MK2 subsurface anomaly densities greater than 2,000 anomalies per acre, were completed using analog subsurface MEC removal prior to the MetalMapper 2x2 investigation.

The MetalMapper 2x2 investigation included a dynamic detection survey, in which 23,023 subsurface anomalies were identified for investigation in the follow-on static MetalMapper 2x2 classification survey. The classification survey resulted in the identification of 11,416 anomalies for intrusive investigation and subsurface removal and 11,607 anomalies as high-confidence non-targets of interest, or items not selected for intrusive investigation.

Due to the end of the KEMRON task order at the Former Fort Ord, subsurface MEC removal was completed in only a portion of the planned supplemental subsurface MEC removal area. The completed intrusive investigation resulted in the recovery of 213 actual targets of interest from 212 target locations, including 28 munitions and explosives of concern items (28 unexploded ordnance items). One discarded military munition item was incidentally found in fuel break grid ME010 during intrusive investigation. The recovered targets of interest also included 66 munitions debris items sufficiently intact for the MetalMapper 2x2 to identify them as targets of interest, 47 quality control seed items, 64 quality assurance seed items, and 8 small ISO-80 seed items from a previously used IVS located in the supplemental subsurface removal area. Two additional MEC items were recovered during analog subsurface removal in data gaps in the MetalMapper MM2x2 survey.

To demonstrate the success of the subsurface munitions and explosives of concern removal, 738 verification and validation investigations were completed in high-confidence non-TOI locations. No targets of interest were recovered from the verification and validation investigations.

Intrusive investigation of an additional 1,543 targets representing potential targets of interest remains in order to complete the supplemental subsurface munitions and explosives of concern removal under a future contract. The remaining intrusive investigations are on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186).

Technical and procedural details are presented in this report.

1 INTRODUCTION

This technical information paper (TIP) describes the work elements and results for the supplemental subsurface munitions and explosives of concern (MEC) removal conducted within portions of the Impact Area Munitions Response Area (MRA) permanent fuel break system at the former Fort Ord, California. The MEC removal was performed by KEMRON Environmental Services, Inc. (KEMRON) for the United States Army Corps of Engineers (USACE) under the Worldwide Environmental Remediation Services Contract #W912DY-10-D-0027, Task Order No. CM01. This work has been completed in accordance with the *Final Quality Assurance Project Plan, Superfund Response Actions Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (MEC QAPP; KEMRON, 2016a); the *Final Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II, Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (AGCMR-QAPP; KEMRON, 2016b), the *Final Work Plan, Remedial Design (RD)/Remedial Action (RA), Track 3 Impact Area Munitions Response Area (MRA), Munitions and Explosives of Concern (MEC) Removal, Former Fort Ord, California* (RD/RA WP, [USACE, 2009]); the *Final Track 3 Record of Decision (ROD), Impact Area Munitions Response Area, Track 3 Munitions Response Site, Former Fort Ord, California* (Track 3 ROD; United States Department of the Army [Army], 2008); and the *Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* (Non-Burn Areas SSWP; Shaw Environmental, Inc. [Shaw], 2010).

1.1 Site Location and History

The former Fort Ord consists of approximately 46 square miles of land located in northwestern Monterey County, California. The Impact Area MRA consists of the 6,560-acre portion of the 8,000-acre historical Impact Area that is entirely within the natural resources management area described in the Installation-Wide Multispecies Habitat Management Plan for Former Fort Ord, California (HMP; USACE, 1997) and is currently identified for transfer to the BLM.

Military activity at the former Fort Ord included the use of the site for cavalry, field artillery, and infantry unit training, including maneuvers and live-fire training operations, from 1917 through 1994. Munitions used at the former Fort Ord included artillery and mortar projectiles, rockets, guided missiles, rifle and hand grenades, training land mines, pyrotechnics, bombs, and demolition materials. Multiple firing ranges operated within the historical impact area, with weapon firing generally directed toward the center of the impact area.

Fort Ord was placed on the National Priorities List of Superfund sites by the U.S. Environmental Protection Agency in 1990. Remedial investigation (RI), feasibility study (FS), and remedial action (RA) activities at the former Fort Ord are being conducted under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980. The former Fort Ord was selected in 1991 for Base Realignment and Closure, and the base was officially closed in September 1994.

The Army completed a munitions response RI/FS for the Impact Area MRA in 2007 (MACTEC Engineering and Consulting, Inc., 2007), followed by the Track 3 ROD (Army, 2008) and development of the RD/RA WP (USACE, 2009) to guide future RA activities in the Impact Area MRA. RA activities under the Track 3 ROD (Army, 2008) and RD/RA WP (USACE, 2009) include MEC removals using vegetation clearance by prescribed burning; technology-aided surface removal; digital geophysical mapping (DGM) surveys; subsurface MEC removal in selected areas; and land use controls.

The Impact Area MRA includes a system of permanent fuel breaks that also serve as access roads throughout the interior of the MRA (Figure 1). The Impact Area MRA permanent fuel break system is based primarily on pre-existing Army fuel breaks designed to contain fires in the dense maritime chaparral caused by military training involving explosive weapons and ordnance. After base closure in 1994, responsibility for mitigating the risk of wildfires was transferred from the Army to the Navy Fire Department at the Naval Post Graduate School. In October 2001, the Ord Military Community Fire Department, which is now known as the Presidio of Monterey Fire Department, assumed fire-protection and fire-suppression responsibilities for the Impact Area MRA and continues to maintain those responsibilities.

Over time, many of the original fuel breaks in the Impact Area MRA had become overgrown with vegetation and restricted by poor access. To reduce the threat posed by potential wildfires and to optimize access and fire suppression capabilities, the Army reestablished and expanded the fuel break system within the Impact Area MRA beginning in 2001. The fuel breaks were designed to be 45 to 50 feet wide and consist of a central road of 15 to 20-foot width, with areas cleared of vegetation 15 feet wide on each side of the road. To support the use of the fuel breaks, subsurface MEC removal was conducted in the central road portion of the fuel breaks, and surface MEC removal was conducted in the 15-foot wide exterior portions. Fuel breaks were divided into grids approximately 100 feet in length for establishment and maintenance tracking. Details of the establishment of the fuel break system are recorded in *4' OE Removal After Action Report, Inland Range Contract, Former Fort Ord, California, Former Fort Ord Fuel Breaks* (USA Environmental, 2001), *Final Maintenance Report, Fuel Breaks, Multi-Range Area (MRA)* (Parsons, 2001), and *Final Reestablishment of Impact Area Fuel Breaks, Phases 1, 2, and 3 After Action Report* (Parsons, 2006). There is no record of subsurface anomalies for which investigation ceased at 4-ft depth with its source remaining unresolved. Please see Volume 1, Section 2.7 Summary of MEC Related Activities Prior to the Remedial Action, for additional information.

1.2 MEC-Related Activities and Data Collected Prior to the Supplemental Subsurface MEC Removal

The Non-Burn Areas SSWP (Shaw, 2010) documents the identified fuel breaks and access roads (Group 2 among the non-burn areas) within the Impact Area MRA which had generally undergone technology-aided surface MEC removal and some subsurface MEC removal prior to the Track 3 ROD. The Non-Burn Areas SSWP described the following tasks for Group 2:

- Conduct DGM survey

- In areas where subsurface MEC removal was not previously conducted, conduct subsurface removal utilizing the DGM data

- In areas where subsurface MEC removal was previously conducted, DGM data will undergo the quality control (QC) and quality assurance (QA) process presented in the SSWP. Anomaly reacquisition and intrusive investigation were not anticipated as part of the QC/QA process because previous work was completed with appropriate QC and QA, but they were allowed if deemed necessary. Subsequent Field Work Variance (FWV) 03-002 (Innovative Technical Solutions, Inc., 2011) provided the following clarification: "In the areas where removal to depth was completed by [previous contractors], Shaw conducted a Category B DGM. The Non-Burn Areas SSWP discussed that QC digs would be conducted in the Category B DGM areas. Ten percent of anomalies will be chosen by the project geophysicists for QC digs."

The Non-Burn Areas SSWP defined the approximately 180-acre system of permanent fuel breaks on which 45-foot wide subsurface removal would be completed (excluding paved sections) as part of the remedial action. The supplemental QC investigation detailed in *Technical Information Paper, Supplemental Quality Control Investigation, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California* (Supplemental QC Investigation TIP), which is included in FWV 017 (KEMRON, 2018a), was conducted in the subset of the system of permanent fuel breaks where subsurface removal was conducted prior to the Track 3 ROD and where DGM was subsequently conducted under the Non-Burn Areas SSWP. Some segments of the fuel break system were excluded from the investigation due to removal from the permanent fuel break system (approximately 16.5 acres), DGM and MEC removal to depth conducted under other remedial action activities (approximately 54.1 acres), or inaccessibility due to pavement cover and concrete culverts (approximately 1.4 acres). The portions of the Impact Area MRA permanent fuel break system included in the supplemental QC investigation totaled approximately 108 acres.

The supplemental QC investigation was conducted in three distinct phases, which are described in the Supplemental QC Investigation TIP (KEMRON, 2018a), with a 10% investigation of the DGM anomalies by ITSI-Gilbane in 2011-12 and in 2014, and with a 5% QC investigation of DGM anomalies in the remaining fuel break segments by KEMRON in 2017. Investigation of 1,822 subsurface anomalies resulted in the recovery of 36 MEC and MEC-like MD items, all but two of which were 81millimeter (mm) mortar projectiles. All recovered MEC and MEC-like MD items were located along the Riso Ridge Road, Mercury Road, Steep Road, Hawkeye Road, Orion Road, and Watkins Gate Road fuel breaks in the portions of the Impact Area MRA with the highest concentration of subsurface anomalies and where 81mm mortar projectiles had been recovered. While handheld analog subsurface removals have proven effective and successful in many areas, the conditions along these portions of the Impact Area MRA fuel break system, specifically anomaly densities greater than 900 anomalies per acre and the potential presence of deep (greater than 2 feet depth) 81mm mortar projectiles (based on where they had been recovered in previous activities), appear to have led to the increased potential for MEC items to remain in the subsurface. The Supplemental QC Investigation TIP recommended additional subsurface MEC

removal to address the possibility of MEC items remaining in portions of the Impact Area MRA fuel breaks.

1.3 Supplemental Subsurface MEC Removal Objectives

To address the possibility of MEC items remaining in portions of the Impact Area MRA fuel breaks, additional subsurface MEC removal was recommended in areas (totaling 25.5 acres) where the following three conditions are met:

- Analog subsurface removal actions performed prior to the Track 3 ROD
- High pre-analog survey anomaly density
- Previously recovered 81mm mortar projectiles

The areas recommended for supplemental subsurface MEC removal are displayed on Figure 2 and summarized in Table 1. Steep Road, which also met the above criteria for the supplemental subsurface removal, has been removed from the system of fuel breaks based on FWV 015 (KEMRON, 2018b) and was therefore not included.

Table 1

Supplemental Subsurface Removal Summary

Fuel Break Segment	Grids	Width (feet)	Length (feet)	Area (acres)
Hawkeye Road	9	45	870	0.99
Impossible Canyon Road	4	15	400	0.14
Impossible Canyon Road	10	45	1,112	1.03
Mercury Road	21	45	2,097	2.40
Nowhere Road	2	15	200	0.09
Nowhere Road	38	45	3,764	4.30
Orion Road	74	45	7,343	8.39
Riso Ridge Road	38	45	3,804	3.92
Watkins Gate Road	41	45	4,098	4.23

1.4 Supplemental Subsurface MEC Removal Approach

As described in the Supplemental QC Investigation TIP (KEMRON, 2018a), the subsurface removal was conducted primarily by advanced geophysical classification (AGC) with the MetalMapper 2x2 (MM2x2) and subsurface investigation and removal of anomalies classified as potential targets of interest (TOI). Two of the fuel break grids, one on Nowhere Road and one on Orion Road, which contained EM61-MK2 subsurface anomaly densities greater than 2,000 anomalies per acre, were completed using analog subsurface MEC removal prior to the MM2x2 investigation.

The subsurface removal work was completed in four phases to allow analysis of early intrusive investigation results to refine the classification process and thresholds prior to implementation of the classification survey and subsurface removal of the entire MEC removal area.

1. Analog subsurface removal in the two higher density fuel break grids, OR066 and NR151.
2. Dynamic MM2x2 detection survey over the entire AGC removal area.
3. MM2x2 classification and subsurface removal within a subset of the AGC fuel break grids, including Mercury Road grids ME007, ME010, and ME020.
4. MM2x2 classification and subsurface removal in the remainder of the recommended AGC fuel break grids.

The dynamic detection survey was used to select the three Mercury Road fuel break grids for the initial subset classification survey. The subset classification survey included cued data acquisition, classification analysis, and intrusive investigation of 437 anomalies. 110 of the 437 were classified as potential TOI for intrusive investigation, while the remaining 327 were classified as non-TOI but intrusively investigated as QC verification digs. After completion of the subset area subsurface removal, removal results were evaluated to verify the target detection and classification thresholds for the classification survey.

1.5 Project Personnel and Subcontractors

MM2x2 data acquisition, analysis, and classification work was performed and supervised by geophysicists experienced in geophysical classification using advanced electromagnetic induction (EMI) sensors. Key personnel included the following:

- Senior Unexploded Ordnance Supervisor: Brad Olson (KEMRON)
- Unexploded Ordnance (UXO) QC Specialist: Bruce McClain (KEMRON)
- UXO Safety Officer: Val Valdez (KEMRON)
- Contractor QC Systems Manager: Chuck Clyde (Gilbane)
- Project Manager: Steve Crane (KEMRON)

- Deputy Project Manager: Erin Caruso (Gilbane)
- Project Geophysicist: Andy Gascho (Gilbane)
- Lead Data Processor: Alison Paski (NAEVA Geophysics, Inc. [NAEVA])
- QC Geophysicist: Alex Kostera (NAEVA)

QA validation of geophysical operations was provided by USACE Geophysicist Kyle Lindsay.

1.6 Health and Safety

Subsurface MEC removal work was conducted in accordance with the Final, Basewide Accident Prevention Plan, Munitions and Explosives of Concern Removal and Soil Remediation, Former Fort Ord, California (KEMRON, 2015).

1.7 Report Organization

This TIP details the work completed as part of the Supplemental Subsurface MEC Removal and provides discussion of the following tasks:

- MEC Removal Activities
    - Blind Seed Item Placement
    - Analog Subsurface Removal
    - MetalMapper 2x2 Assembly and Verification
    - MetalMapper 2x2 Dynamic Detection Survey
    - MetalMapper 2x2 Static Classification Survey
    - MetalMapper 2x2 Static Classification Data Analysis and Classification
    - Intrusive Investigation and Subsurface Removal
- Results
- Quality Control
- Data Verification and Validation

2 SUPPLEMENTAL SUBSURFACE MEC REMOVAL ACTIVITIES

2.1 Blind Seed Item Placement

Prior to the supplemental subsurface MEC AGC removal activities, QC seed items were placed in random locations in the subsurface throughout the subsurface removal area to verify the quality of subsurface MEC removal activities, including analog removal, MM2x2 data acquisition, processing and analysis, and intrusive investigation. QC seed item locations were camouflaged with dirt or vegetation to hide ground disturbance, and no QC seed items were placed in paved areas. QC seed items consisted of small schedule-80 industry standard objects (ISO). 78 QC seed items were buried 6 inches below ground surface. Seed items were emplaced by the QC Geophysicist and a UXO Technician II utilizing a real-time kinematic (RTK) global positioning system (GPS) receiver to measure location information for each seed item, and precise burial information was recorded. To maintain the integrity of the QC program, seed item burial information was not provided to personnel involved in data acquisition, processing, or intrusive investigation activities until those activities were completed. Details of the blind seeding burial information and results are included in Section 4.1 and in the *Quality Control Seeding Report – Supplemental Subsurface MEC Removal, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California*, which is included in Appendix A.

Additional QA validation seed items were emplaced by the USACE Project Geophysicist. QA validation seed item information was not provided to the subsurface MEC removal team until data acquisition, processing, and intrusive investigation activities were completed. QA validation seed information is presented in Section 5.1.

2.2 Analog Subsurface Removal

Analog subsurface MEC removal utilizing handheld metal detectors was completed, in accordance with the MEC QAPP (KEMRON, 2016a), prior to MM2x2 AGC DGM in two grids, Orion Road grid OR066 and Nowhere Road grid NR151, where the EM61-MK2 DGM data indicated high subsurface anomaly density (greater than 200 anomalies per acre). This work was completed between November 8, 2018 and November 20, 2018 and included 925 individual investigations. 126 pounds of MD were recovered, along with 2 QC seeds (not included in the 78 QC seeds emplaced for the AGC survey as discussed in Section 2.1) and 1 QA validation seed. No MEC items were recovered in the analog subsurface MEC removal.

2.3 MetalMapper 2x2 Assembly and Verification

Prior to MM2x2 data acquisition, instrument assembly and performance were verified through instrument function tests and an instrument verification strip (IVS) survey. The IVS utilized for the initial IVS surveys was located at Unit 4 in the Impact Area MRA and had been previously constructed by the QC Geophysicist and a UXO Technician II, in accordance with the specifications provided in the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c).

2.3.1 MetalMapper 2x2 Assembly

The MM2x2 system was assembled in accordance with standard operating procedure (SOP) AGCMR-01 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c) on October 22, 2018. Assembly of the system included mounting the coil assembly, wheels, RTK GPS and inertial measurement unit (IMU) on the survey sled and connecting and routing all cables to the data acquisition computer. Assembly of the MM2x2 system included verification of the orientation of the transmit coils, the orientation of the IMU, operation of the RTK GPS, and correct input of the data acquisition parameters.

2.3.2 Initial Instrument Function Tests

On October 22, 2018, initial system operation was verified by acquiring a system function test utilizing a small schedule 80 ISO (ISO-80), as described in SOP AGCMR-01 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). Transmit current levels were monitored in addition to verification of correct modeled location and library match of the ISO-80 test object. System assembly and verification were completed by the data acquisition geophysicist and overseen by the Project Geophysicist.

After completion of the instrument tests, initial dynamic and static IVS surveys were performed at the Unit 4 AGC IVS, also on October 22, 2018, as described in SOP AGCMR-02 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). The IVS consisted of 2 small ISO-80s and 1 blank location. One small ISO-80 was buried vertically, 15 centimeters (cm) below ground surface (to the center of mass of the ISO), and the second small ISO-80 was buried horizontally, 10cm below ground surface (to the center of mass of the ISO). The IVS location and layout are shown on Figure 3, and the IVS Memorandum is provided in Appendix B.

2.4 MetalMapper 2x2 Dynamic Detection Survey

The MM2x2 dynamic detection survey of the 25.5-acre supplemental subsurface MEC removal area included data acquisition and data processing and analysis tasks and culminated in the creation of a list of anomalies (for further static classification survey) potentially representing subsurface TOI. Details of the detection survey data acquisition, processing, and analysis approaches are presented in SOPs AGCMR-05 and AGCMR-06 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). Measurement quality objectives (MQO) associated with the MM2x2 dynamic detection survey are presented in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c).

2.4.1 Dynamic Detection Data Acquisition

MM2x2 dynamic detection data acquisition was conducted between October 22, 2018 and April 16, 2019 by a data acquisition team comprised of 2 NAEVA geophysicists. Data acquisition was completed in accordance with SOP AGCMR-05 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c), including verification of

successful attainment of MQO. Gaps in the dynamic detection survey due to terrain or vegetation were surveyed by a team of UXO Technicians utilizing handheld analog metal detectors in accordance with the MEC QAPP (KEMRON, 2016a). Details of the analog data gap investigation are included in Section 3.3.2.

2.4.2 Dynamic Detection Data Processing and Analysis

Processing and analysis of the detection survey data, including target selection and verification of successful attainment of MQO, were accomplished by NAEVA data processors using Geosoft's Oasis Montaj UX-Analyze Advanced (UXA) software, in accordance with SOP AGCMR-06 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). The summed monostatic Z-component measurements in the detection survey data were processed and analyzed to identify anomalies meeting the minimum response amplitude criteria of potential TOI (2.5 millivolts/amp), which were based on the initial IVS survey results and the test pit response of an inert 37mm projectile at 16 inches below ground surface.

The MM2x2 dynamic detection survey resulted in the identification of 23,023 anomalies as potential TOI, each of which was assigned a unique identification number for the follow-on static classification survey. Detection survey results are discussed in Section 3.1. The subsurface anomaly locations selected from the dynamic detection data are displayed on Figure 4.

2.5 MetalMapper 2x2 Static Classification Survey

The static MM2x2 classification survey of the 23,023 subsurface anomalies identified for classification analysis included data acquisition and data processing, analysis, and classification tasks and culminated in the creation of a list of targets ranked by their likelihood of being a TOI. The ranked target list was divided into targets for intrusive investigation and removal and targets which could be left in place. Details of the classification survey data acquisition, processing, and analysis approaches are presented in SOPs AGCMR-07 and AGCMR-08 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). MQO associated with the MM2x2 static classification survey are presented in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c).

2.5.1 MetalMapper 2x2 Static Classification Data Acquisition

MM2x2 static classification data acquisition was conducted between November 13, 2018 and November 26, 2019, in accordance with SOP AGCMR-07 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c).

Static function test measurements and IVS surveys were completed at the beginning and end of each day during the MM2x2 survey. Static data acquisition for target classification involved positioning the MM2x2 sensor over each anomaly selected from the MM2x2 dynamic detection survey and acquiring static measurements. Data acquisition procedures included the following steps, which are described in detail in SOP AGCMR-07 [Appendix B of the AGCMR-QAPP (KEMRON, 2016b)], as modified for MM2x2 by FWV 012 (KEMRON, 2018c):

1. **Background measurement acquisition.** Static MM2x2 data was acquired at previously-identified background locations, where no metallic interference exists. Background measurements record the non-target system response, which includes responses from the ambient environment, soil and geologic features, and the MM2x2 system itself. During data processing, the background signal was removed from target anomaly measurements, leaving only the response from the unknown metallic anomaly source. Background measurements were collected at a minimum of every hour during data acquisition activities to provide background signatures representative of changing target locations and environmental conditions.

2. **Navigation to the anomaly location**. Anomaly locations were loaded into the MM2x2 data acquisition computer prior to data acquisition operations to allow navigation to each anomaly through the use of the MM2x2 RTK GPS positioning system. Although the MM2x2 has the ability to direct the data acquisition geophysicist to an anomaly location based upon the geophysical signal received, the first measurement was always acquired at the provided detection anomaly location. After navigation to the anomaly location, the center of the sensor was precisely positioned (within 2 inches) over the provided anomaly location.

3. **Static sensor measurement acquisition**. The static measurement acquisition process was initiated, taking care that the sensor remained stationary during the measurement and was isolated from all external sources of electromagnetic signals. Any metal associated with the sensor and deployment platform (e.g., console, support structures) that could not be reasonably distanced from the sensor was kept in the same physical location with respect to the sensor as during background measurements.

4. **Acquired data integrity and quality verification.** Immediately after data acquisition, the integrity and quality of the data were verified by the data acquisition geophysicist by inspection of the MM2x2 data acquisition display to verify the following:

    - The data acquisition cycle completed properly
    - The transmit current for each transmitter was within an acceptable range (≥ 5.5 amps)
    - The decay curves measured by each receiver coil appeared reasonable and were not flat-lined or over-saturated
    - GPS and IMU information were recorded

The additional step of performing a field inversion to verify that the acquired data measurement was centered over the anomaly source, which is described in SOP AGCMR-07 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c), was not conducted as part of the data acquisition process because this function was not available

in the MM2x2 acquisition software at the time. The inversion was therefore performed by the data processor to verify that each measurement met the measurement performance criteria.

2.5.2 Classification Library Creation

The existing Department of Defense classification library data derived from previous Environmental Security Technology Certification Program and Military Munitions Response Program projects and included with UXA was used to establish the site-specific classification library for the supplemental subsurface MEC removal. The site-specific library used for classification for this activity was created by augmenting the existing classification library with test pit measurements of an 8-inch projectile conducted in the Badger Flats area of Unit 12, as described in the *Unit 23 Risk Reduction Technical Memorandum, Former Fort Ord, California* (KEMRON, 2020). The final site-specific classification library included signatures for all expected subsurface MEC removal TOI, including QC and QA validation seed items.

2.5.3 Data Analysis and Classification

Static data processing and classification analysis were completed by NAEVA data analysts in accordance with SOP AGCMR-08 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). Data processing included isolation and removal of background responses from the MM2x2 data measurements and application of the inversion algorithms in the UXA extension of Geosoft Oasis Montaj to model the intrinsic features of each anomaly source. The modeled features, in the form of primary, secondary, and tertiary polarizability curves (which represent the three-dimensional structure of the item), were used to classify each anomaly as a TOI (likely to be a MEC item) or a non-TOI (highly-likely to be something other than a TOI). Classification was accomplished primarily through matching each target's polarizability curves to the site-specific library of TOI signatures, with additional consideration given to cluster and feature space analysis. Targets classified as TOI (and those for which the acquired MM2x2 data did not support a confident classification decision) were selected for reacquisition and subsurface removal. Targets classified as non-TOI were left in place.

After applying background corrections, the data was modeled to estimate the features of each target anomaly using the UXA process data interface. The modeled features for each anomaly include extrinsic parameters (location and orientation) as well as the intrinsic parameters related to the object size, shape and composition. The target feature estimation process was accomplished through inversion modeling of the static MM2x2 data. Inversion modeling involves proposing and testing multiple combinations of potential targets and locations to determine which combinations produce a result most like the measured data for each anomaly. Both single-source and multiple-source inversion routines were run to determine the parameters of each anomaly source (single-source inversion), or of each group of anomaly sources (multiple-source inversion), that would produce a response similar to the measured response at each anomaly location. The modeled intrinsic parameters are visualized as three principal axis polarizabilities, also known as betas (β), which describe the EMI response of each target along the three principal axes of the item. The combination of principal axis polarizabilities is unique to an item and is therefore used

for classification by comparing the polarizabilities to a library of representative munitions item polarizabilities. Size and decay parameters of each anomaly at specific timegates ranging from 25 microseconds to 24.375 milliseconds were also calculated, in accordance with SOP AGCMR-08 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c).

The single-source inversion solves for a single target as the anomaly source, while the multiple-source inversion assumes that the measured response is the result of multiple anomaly sources. The multiple-source solver not only presupposes multiple sources contributing to a measured anomaly response but also produces several potential combinations of anomaly sources. Each potential combination proposes a configuration of targets whose modeled response reasonably fits the measured data. For any given target, one potential combination may have three anomaly sources, while a second potential combination for the same measurement may have two or four anomaly sources. This process reflects the fact that, with an unknown number of potential targets of different sizes and shapes, several different models can closely match the measured data. A separate fit coherence value, which measures the degree of fit to the measured data, is derived for each multiple-source potential combination as well as for the single-source model.

Model results were used for classification only if they met the MQO in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c), verifying that they are of sufficient quality to support classification.

2.5.4 Daily Instrument Verification Strip

At the beginning and at the end of each day of data acquisition, static measurements were acquired at each IVS target location, as described in SOP AGCMR-02 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). The IVS measurements were processed as described above, and the derived features were assessed against the MQO presented in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c).

2.5.5 Data Verification

Data verification was conducted each day of data acquisition to demonstrate the achievement of project MQO. Prior to importing MM2x2 data into the UXA module within Geosoft's Oasis Montaj geophysical processing environment, the data processor specified general settings in UXA to define the data acquisition parameters for the survey, including settings such as survey mode (static or dynamic), database names, and distance units. After initial setup of the UXA project, the data processor imported data into the following four separate databases:

- Static background measurement data
- Background features
- Static anomaly measurement data
- Target features

The target features database initially contained the locations of each surveyed anomaly but was subsequently populated with summaries of the derived feature and classification information for each target. The background features database initially contained the locations of each background measurement but was subsequently populated with statistics and QC check values.

After importing the static data, the data processor verified the quality of the measurements against the MQO provided in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c), for the following characteristics:

- Transmit (Tx) current within limits
- GPS fix quality
- Valid IMU data
- EMI response signal not saturated
- Offset of acquisition location from flag/anomaly list location

A preliminary library match using the single-source modeled parameters was performed as part of data verification to assist in determining the usability of the data and to verify that static classification survey MQO have been satisfied.

Graphic decision plots displaying a summary of measured and modeled data associated with each static measurement were evaluated along with the targets feature database for the following:

- Tx current
- Valid GPS fix
- Valid IMU reading (or correctable based on field notes)
- Offset from flag within MQO
- Acceptable fit error
- Fit coherence within MQO
- Reasonable size and decay
- Successful library match

2.5.6 Initial Classification

Classification of targets was based upon objective and quantitative criteria. Using these criteria, a prioritized list was created with high-likelihood TOI placed at the top of the list (just after digs classified as cannot analyze) and high likelihood non-TOI placed at the bottom of the list. Cannot analyze targets are those for which the measured data could not support a confident classification

decision. Because these targets could not be confidently identified as non-TOI, they were excavated. The primary method for classification was library matching, supplemented by cluster analysis and feature space analysis.

2.5.6.1 Library Matching

Classification was based primarily on the fit metric (values from 0.0 to 1.0, with 1.0 representing a perfect match) generated by UXA during a comparison of the β values estimated for each surveyed target and the β values of the TOI items in the classification library. The comparison was performed via the library match utility in UXA. The fit metric is a measure of the fit correlation between a target and the library entry that best fits that target, with higher values indicating a better fit between the target and the corresponding item in the library. The library fit analysis matches the following four combinations of βs to those of the candidate library TOI:

- β1, β1/β2, β1/β3
- β1, β1/β2
- β1/β2, β1/β3
- β1

The confidence metrics for each fit combination were averaged to derive a decision metric.

Both single-source and multiple-source models were used during the inversion process for each flagged location. The results of all the models were compared against the library signatures, and the most conservative result, or the result most similar to a TOI, was saved. Once completed, the targets were ranked, or ordered, from TOI to non-TOI according to their library-match comparison values. Library-match comparison values below the project decision metric threshold were considered non-TOI.

2.5.6.2 Cluster Analysis and Feature Space Analysis

Cluster analyses were performed using the UXA scatter analysis utility to identify clusters of anomalies with similar β signatures not in the classification library. Due the comprehensive site-specific list of TOI for the subsurface removal, cluster analysis was expected to be unnecessary, and it was anticipated that all TOI were already identified with signatures in the library. Cluster analysis, however, was performed to provide additional confidence in the subsurface removal. The same library matching method described above was used, but instead of using the known TOI signature library, a “self-match” of each measured anomaly was performed. Static measurements with high cluster threshold confidence metrics were identified and reviewed along with a size-decay feature space plot to determine if they were related to a grouping of unique signatures potentially representing a TOI not contained in the initial classification library. For each identified cluster, the data processor selected a representative sample to be intrusively investigated. If the intrusive investigation identified a potentially hazardous item that should be on the TOI list, a representative signature would have been placed in the site-specific library, and

the library matching process would have been repeated to ensure that all items with similar β signatures were classified as TOI. No additional TOI requiring placement in the munitions library were identified.

Individual items not matching any library items but having β signatures indicating large, axially-symmetric, thick-walled objects were also identified and investigated as part of the calibration data and would have been added to the library if they were determined to be TOI. No additional TOI requiring placement in the munitions library were identified.

2.5.7 Classification Thresholds

Classification threshold values were derived from previous AGC work at the former Fort Ord and evaluated throughout the work by comparing intrusive investigation results to modeled anomaly source predictions. Classification expressions utilized during classification analysis contained the logic for sorting the ranked target list and included the following categories:

- Category 0 (Cannot Analyze)
- Category 1 (High-Confidence TOI)
- Category 2 (Inconclusive)
- Category 3 (High-Confidence Non-TOI)

Category 0 (Cannot Analyze) anomalies included measurements where the inversion process failed, reliable polarizabilities could not be extracted from the data, modeled depths were unreasonable, or fit coherence was poor. Category 1 anomalies were those highly-likely to be TOI. Category 2 (Inconclusive) anomalies consisted of measurements not obviously TOI but with enough TOI characteristics that they could not be confidently classified as non-TOI. Category 3 anomalies were those highly-likely to be non-TOI. The following library match metric thresholds, also referred to as decision statistics, were used as the initial criteria to classify and rank the anomalies:

- Category 1 (High-Confidence TOI) > 0.95
- Category 2 (Inconclusive) > 0.825
- Category 2 (Inconclusive, Low Signal) > 0.750
- Category 0 (Cannot Analyze)
    - Poor Fit Coherence < 0.800
    - Unreasonable depth > 2 meters
    - High Chi-square value > 8000

The selection thresholds utilized were (a) the industry standard values (or within an acceptable range of that value based on site conditions), (b) set low enough to expect all TOI to be recovered based on validation digs and QC checks, (c) set at values that reduce the number of unnecessary digs, and (d) tailored to the signal to noise ratio of the collected data, so that lower signal targets were classified more conservatively. In some cases, the data analyst manually overrode the thresholds and moved anomalies to other classification categories after analysis of the data.

2.5.8 Final Classification

After each grouping of static MM2x2 data were acquired and analyzed, a preliminary ranked list containing all measured anomalies was delivered to the QC Geophysicist to verify that relevant MQO (including QC seed classification) were met, and a final review of the ranked list was performed to generate a ranked target list, which is included in Appendix C. Every target measured in the static classification survey was included on the prioritized list, classified as TOI, non-TOI, or cannot analyze, and sorted based on its likelihood to be a TOI. All targets in the cannot analyze and TOI categories were selected for intrusive investigation. Intrusive investigation locations, including classification categories, are shown on Figure 5.

2.6 Intrusive Investigation and Subsurface Removal

Due to the end of the KEMRON task order at the Former Fort Ord, subsurface removal remains to be completed on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186) under a future contract. Of the 23,023 dynamic detection targets identified for static MM2x2 measurement, 6,673 were located in the grids remaining to be completed, and 16,350 were located in the portions where subsurface removal is complete. As described in Section 3.2, 6,477 anomalies, approximately 40% of the 16,350 targets measured in the completed grids during the static classification survey, were classified as high-confidence non-TOI and determined to be acceptable to leave in place. The remaining 9,873 anomalies, including those classified as high-confidence TOI, those that could not be analyzed, and those for which a confident non-TOI classification could not be made, were identified for intrusive investigation and removal. As discussed in Section 5.3, 738 verification and validation intrusive investigations were performed as part of the QC/QA process, 186 of which were already included in the ranked dig list but also served as QC verification inspections. The remaining 552 verification and validation investigations were additional digs solely for QC/QA verification and validation and included 20 targets selected from the dynamic MM2x2 detection data that were below the target selection threshold and therefore not identified for the static classification survey, 327 general QC verification investigations and 205 static classification measurements categorized as high-confidence non-TOI anomalies. Including the additional QC/QA verification and validation investigations, 10,425 targets were identified for intrusive investigation in the portions of the fuel breaks where the supplemental subsurface removal has been completed. All intrusive operations were performed in general accordance with the MEC QAPP (KEMRON, 2016a), with AGC-specific details in accordance with SOP AGCMR-09 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c).

2.6.1 Reacquisition of Anomalies Selected for Intrusive Investigation

Anomalies selected for intrusive investigation were reacquired by a NAEVA Geophysicist and a KEMRON UXO Technician II using RTK GPS to place a flag at the modeled target location derived through the data processing and classification process in accordance with SOP AGCMR-07 [Appendix B of the AGCMR-QAPP (KEMRON, 2016b)], as modified for MM2x2 by FWV 012 (KEMRON, 2018c). The anomaly ID was written in indelible marker on a survey flag placed at the anomaly location.

2.6.2 Intrusive Investigation and Removal of Anomaly Sources

After reacquisition of the anomalies selected for intrusive investigation, each anomaly was intrusively investigated in accordance with SOP AGCMR-09 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). Intrusive investigation and subsurface removal of all targets, regardless of classification category, identified in three test grids on Mercury Road (ME007, ME010, and ME020) began December 17, 2018, and were completed January 10, 2019. These investigations included 437 targets, 110 of which were classified as Category 0, 1, or 2 targets (standard intrusive investigations) and 327 of which were classified as Category 3 targets (High-Confidence Non-TOI) and intrusively investigated as QC digs. After analysis of the dig results, data analysis, classification, and ranking of the remaining static MM2x2 measurements began. Intrusive investigation and subsurface removal of the remaining targets on the ranked classification list began April 11, 2019 and was completed January 27, 2020. The final set of anomalies to be investigated included 20 additional QC verification investigations and 205 QA validation investigations selected as part of the verification and validation process approved in the final Geophysical Classification Validation Plan (Appendix D). Verification and validation digs were completed between January 29, 2020 and February 10, 2020.

Specific intrusive investigation procedures, including vertical and lateral excavation limits, are detailed in SOP AGCMR-09 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). Due to the precision of AGC data and modeling results, as well as to the nature of classification surveys, where non-TOI metallic items are purposely left in the ground, intrusive investigations were conducted with different procedures than those of intrusive investigations based on standard DGM. Each excavation was conducted only in the immediate vicinity of the reacquired target location, with an approximate 10-inch search radius. The investigation proceeded until the predicted item (or a metallic item of comparable size and shape) was recovered or until the excavation depth reached 12 inches below the predicted depth. For anomalies with no modeled source item and reliable predicted depth, such as Category 0 (cannot analyze) and Category 3 (high-confidence non-TOI investigated for verification and validation purposes), intrusive investigation followed standard non-AGC procedures, as described in UXO SOP 4 (Appendix B of the MEC QAPP [KEMRON, 2016a]), and proceeded until inspection with a handheld metal detector indicated that no anomaly source remained.

Post-investigation anomaly resolution was verified by comparing the modeled classification results (predicted item, identity, and depth) to the actual intrusive investigation results. All intrusive investigation results successfully matched the predicted target characteristics.

3 RESULTS

3.1 Detection Survey Results

The MM2x2 dynamic detection survey resulted in the identification of 23,023 subsurface anomalies for investigation in the static MM2x2 classification survey. The targets selected for the static classification survey are displayed on Figure 4. A list of the dynamic detection survey targets is included in Appendix C.

3.2 Classification Results

A total of 23,023 anomalies were investigated by static MM2x2 analysis. The classification process resulted in the identification of 11,416 anomalies for intrusive investigation and subsurface removal (9,873 in the portions of the supplemental subsurface removal area where subsurface removal has been completed and 1,543 in the portions remaining to be completed under a future contract) and 11,607 anomalies as high-confidence non-TOI, or items not selected for intrusive investigation (6,477 in the portions of the supplemental subsurface removal area where subsurface removal has been completed and 5,130 in the portions remaining to be completed under a future contract). A summary of the classification results is presented in Table 2.

Table 2

Classification Category Summary

Classification Category	Completed Subsurface Removal Area	Remaining Subsurface Removal Area	Total
Category 0 (Cannot Analyze)	6,649	294	6,943
Category 1 (High-Confidence TOI)	260	117	377
Category 2 (Inconclusive)	2,964	1,132	4,096
Category 3 (High-Confidence Non-TOI)	6,477	5,130	11,607
TOTAL	**16,350**	**6,673**	**23,023**

3.3 Subsurface Removal Results

Intrusive investigation and subsurface removal results in the portions of the supplemental subsurface removal area where subsurface removal has been completed indicate that 60% of TOI were recovered from the Category 1 (High-Confidence TOI) anomalies, and 35% of TOI were recovered from Category 2 (Inconclusive) anomalies, with good correlation between modeled data sources and intrusive results. The remaining 5% were recovered from Category 0 (Cannot Analyze) anomalies.

3.3.1 Recovered Targets of Interest

The 9,873 anomalies classified as Category 0, Category 1, and Category 2 (in the portions of the supplemental subsurface removal area where subsurface removal has been completed) were intrusively investigated, resulting in the recovery of 213 actual TOI from 212 target locations (1 target location included 2 81mm mortar projectiles). The recovered TOI included 58 81mm mortar projectiles, 2 60mm mortar projectiles, 1 57mm projectile, 25 40mm projectiles, 3 37mm projectiles, 1 20mm projectile, 1 rifle grenade, 1 point-detonating projectile fuze, 2 grenade fuzes, 47 QC seed items, 64 QA validation seed items, and 8 small ISO-80 seed items from a previously used IVS located in the supplemental subsurface removal area. One recovered MEC item was a cartridge, 40mm, practice M781 discarded military munition (DMM). The DMM find was incidental and not considered a TOI. The details of the incidental find are discussed in Appendix F. 28 of the recovered TOI MEC items were UXO items, including 24 projectiles, 81mm mortar, high explosive, M43 series; 1 projectile, 81mm mortar, high explosive, M374 series; 1 projectile, 60mm mortar, high explosive, M49 series; 1 projectile, 37mm, low explosive, MK2; and 1 fuze, point-detonating, M51 series. The recovered TOI also included 66 MD items sufficiently intact for the MM2x2 to identify them as TOI. The recovered TOI MD items included 33 81mm mortar projectiles, 1 60mm mortar projectile, 1 57mm projectile, 25 40mm projectiles, 2 37mm projectiles, 1 20mm projectile, 1 rifle grenade, and 2 grenade fuzes. Subsurface removal results are summarized in Table 3, and the locations of the recovered TOI are displayed on Figure 6. Recovered MEC items with their specific model descriptions are also shown on Figure 7.

Table 3

Recovered Target of Interest Summary

Item	Quantity Recovered	Correctly Classified as Potential TOI	Category 0	Category 1	Category 2	MEC	MD
81mm Mortar Projectile	58	58	8	31	19	25	33
60mm Mortar Projectile	2	2	1	0	1	1	1
57mm Projectile	1	1	0	1	0	0	1
40mm Projectile	25	25	0	12	13	0	25
37mm Projectile	3	3	0	2	1	1	2
20mm Projectile	1	1	0	0	1	0	1
Rifle Grenade	1	1	0	0	1	0	1
Projectile Fuze	1	1	0	0	1	1	0
Grenade Fuze	2	2	0	0	2	0	2
QC Seed	47	47	0	34	13	N/A	N/A
QA Validation Seed	64*	64*	2	40	22	N/A	N/A
IVS Seed from Previous Projects	8	8	0	8	0	N/A	N/A

Category 0 = Cannot Analyze

Category 1 = High-Confidence TOI

Category 2 = Inconclusive

* As described in Section 5.2, 1 QA validation seed was misclassified as a non-TOI and removed after completion of a Root Cause Analysis and Corrective Action.

3.3.2 Analog Data Gap Investigation

As described in Section 2.4.1, gaps in the dynamic AGC detection survey due to terrain or vegetation were surveyed by a team of UXO Technicians utilizing handheld analog metal detectors in accordance with the MEC QAPP (KEMRON, 2016a). Data gaps occurred in 85 fuel break grids and totaled 1.07 acres. Intrusive investigation results included 20,317 individual analog investigations and resulted in the recovery of 2 UXO items and 1,098.1 pounds of MD. The recovered UXO items included 1 projectile, 81mm, mortar, smoke, white phosphorus, M375 series recovered in Nowhere Road grid NR155 and 1 projectile, 40mm, high explosive tracer, MK II series recovered in Orion Road grid OR073. The subsurface removal in all analog data gaps was subjected to standard QC and QA inspections, and all data gaps passed inspection.

3.4 Remaining Intrusive Investigation Locations

Due to the end of the KEMRON task order at the Former Fort Ord, intrusive investigation of an additional 1,543 targets representing potential TOI (including QC and QA seed items) remains in order to complete the supplemental subsurface MEC removal under a future contract. The remaining intrusive investigations are on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). The remaining intrusive investigation locations are shown on Figure 8 and listed in Appendix C.

4 QUALITY CONTROL

Quality control of MM2x2 data, processing and classification was conducted by the QC Geophysicist. Data that had undergone quality verification by the data processor was provided to the QC Geophysicist for validation prior to data processing and classification. The QC Geophysicist validated the data quality by monitoring the data for agreement with the MQO in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c) and returned the data to the data processor for completion of data classification. The QC Geophysicist also validated the completeness and quality of the site-specific classification library. The data processing, classification, and ranking process were verified against the MQO in Worksheet 22 by the QC Geophysicist prior to finalization of the ranked classification dig list.

4.1 Blind Seeding Program

As described in Section 2.1 and the Quality Control Seeding Report (Appendix A), 78 small ISO-80s were placed in random locations throughout the subsurface removal area at a depth of 6 inches below ground surface as blind QC seed items. All 78 QC seed items were detected during the dynamic detection survey and selected as targets for the static classification survey. One QC seed item, however, was removed after the dynamic detection survey and prior to the static classification survey, leaving 77 QC seed items for the static classification survey. All remaining QC seed items were classified as potential TOI and identified for subsurface removal on the ranked classification dig list.

47 of the 77 QC seed items in place for the static MM2x2 survey were located in the fuel break grids where subsurface removal has been completed. All 47 QC seed items in the completed

portions of the fuel breaks were recovered during subsurface removal operations in accordance with the seed item recovery MQO established in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). The QC seed item recovery information for the completed portions of the fuel breaks is summarized in Table 4, and the locations are displayed on Figure 9.

30 QC seed items remain in the fuel break grids not yet intrusively investigated on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). The QC Geophysicist has verified that these QC seed items were correctly identified and classified during the MM2x2 investigation and have been included in the list of intrusive investigation locations that remain to complete the subsurface removal. To maintain the integrity of the QC program, seed items emplaced in the grids not yet intrusively investigated are not included in tables or figures in this document.

4.2 Measurement Quality Objectives

The MQO for MM2x2 data processing and analysis are presented in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c) (including MQO for daily IVS and function test performance as well as for individual measurement metrics). Performance relative to the MQO was assessed during the processing and analysis of

the data. MM2x2 data were not used to classify targets until these MQO were shown to have been met. Performance relative to key MQO is shown in Table 5.

Table 5

Measurement Quality Objective Performance

Measurement Quality Objective	DFW/SOP Reference	Frequency	Acceptance Criteria	Performance
Detection (Dynamic) Survey				
Initial derived target position accuracy (IVS)	Dynamic Detection Survey/ SOP AGCMR-02/ SOP AGCMR-05/ SOP AGCMR-06	Once during initial system IVS test	All IVS item fit locations within 10 inches of ground truth locations	The initial fit locations of the IVS items were offset 0.4 inches and 0.6 inches from the ground truth locations.
Initial detection response amplitudes (IVS)	Dynamic Detection Survey/ SOP AGCMR-02/ SOP AGCMR-05/ SOP AGCMR-06	Once during initial system IVS test	Response amplitudes within 25% of predicted (or baseline) amplitudes	The initial response amplitudes of the IVS items were within 9% of the predicted amplitudes.
Ongoing derived target position precision (IVS)	Dynamic Detection Survey/ SOP AGCMR-02/ SOP AGCMR-05/ SOP AGCMR-06	Twice daily, at the beginning and end of data acquisition, as part of IVS testing	All IVS item fit locations within 10 inches of the average locations	The ongoing fit locations of the IVS items were offset a maximum of 2.2 inches and 1.7 inches from the average locations.
Ongoing detection response precision (IVS)	Dynamic Detection Survey/ SOP AGCMR-02/ SOP AGCMR-05/ SOP AGCMR-06	Twice daily, at the beginning and end of data acquisition, as part of IVS testing	Response amplitudes within 25% of the predicted response amplitudes	The ongoing response amplitudes were within 14% of the predicted response amplitudes.
Down-line measurement spacing	Dynamic Detection Survey/ SOP AGCMR-05	Verified for each survey unit using existing UX Detect tools based upon monostatic Z coil data positions	98% ≤ 8 inches between successive measurements	Over 99% of recorded down-line measurements were within 8 inches of their neighbor measurements.
Coverage	Dynamic Detection Survey/ SOP AGCMR-05	Verified for each survey unit using existing UX Detect tools based upon GPS antenna positions	95% (or greater) of the line spacing within 2 ft., and 100% of the line spacing within 2.6 ft., with no unexplained data gaps.	Over 99% of the line spacing was within 2 ft., and 100% was within 2.6 ft. No unexplained data gaps exist in the dynamic detection data.

Measurement Quality Objective	DFW/SOP Reference	Frequency	Acceptance Criteria	Performance
Transmit current levels	Dynamic Detection Survey/ SOP AGCMR-05	Evaluated for each sensor measurement	Peak transmit current ≥ 5.5 amps	Measured peak transmit current levels were consistently >5.5 amps
Dynamic detection performance	Dynamic Detection Survey/ SOP AGCMR-05/ SOP AGCMR-06	Evaluated for each dataset	All blind seed items detected and positioned within 16-inch radius of ground truth location	All blind QC seed items were detected and positioned within 8.5 inches of the ground truth location.
Position data are valid (1 of 2)	Dynamic Detection Survey/ SOP AGCMR-05/ SOP AGCMR-06	Evaluated for each sensor measurement	GPS status flag indicates RTK fix	All positional data used for the dynamic detection survey had fixed RTK locations.
Position data are valid (2 of 2)	Dynamic Detection Survey/ SOP AGCMR-05/ SOP AGCMR-06	Evaluated for each sensor measurement	Orientation data valid Data input string checksum passes	All orientation data used for the dynamic detection survey was valid.
Classification (Cued) Survey				
Initial derived polarizabilities accuracy (IVS)	Cued Classification Survey/ SOP AGCMR-02/ SOP AGCMR-07/ SOP AGCMR-08	Once during initial system IVS test	Library Match metric ≥ 0.9 for each set of inverted polarizabilities	The derived polarizabilities of the IVS items matched the classification library item with decision statistics of 0.9756 and 0.9823.
Initial derived target position accuracy (IVS)	Cued Classification Survey/ SOP AGCMR-02/ SOP AGCMR-07/ SOP AGCMR-08	Once during initial system IVS test	All IVS item fit locations within 5 inches of ground truth locations	The fit locations of the IVS items were offset 0.4 inches and 0.6 inches from the ground truth locations.
Ongoing derived polarizabilities precision (IVS)	Cued Classification Survey/ SOP AGCMR-02/ SOP AGCMR-07/ SOP AGCMR-08	Twice daily as part of IVS testing	Library match to initial polarizabilities metric ≥ 0.9 for each set of three inverted polarizabilities	The derived polarizabilities of the IVS items from daily IVS tests matched the classification library item with a decision statistic greater than 0.9414 and 0.9369
Ongoing derived target position precision (IVS)	Cued Classification Survey/ SOP AGCMR-02/ SOP AGCMR-07/ SOP AGCMR-08	Twice daily as part of IVS testing	All IVS item fit locations within 5 inches of average of derived fit locations	The fit locations of all IVS items from the daily IVS tests were within 1.9 inches

Measurement Quality Objective	DFW/SOP Reference	Frequency	Acceptance Criteria	Performance
Ongoing production area background measurement frequency	Cued Classification Survey/ SOP AGCMR-04/ SOP AGCMR-07	Evaluated for each background measurement	Time separation between background measurement and anomaly measurement < 2 hour	All anomaly measurements were acquired within 2 hours of a valid background measurement.
Confirm inversion model supports classification	Cued Classification Survey/ SOP AGCMR-08	Evaluated for all models derived from a measurement (i.e., single-source and multiple-source models)	Derived model response must fit the observed data with a fit coherence > 0.8	All anomaly measurement used for classification fit the observed data with fit coherences of 0.940 and 0.919.
Confirm all anomalies classified	Cued Classification Survey/ SOP AGCMR-08	Evaluated for each anomaly (flag) location	100% of anomalies are classified as: TOI/Non-TOI/can't analyze	All anomalies were classified and are included in the ranked target list (Appendix C).
Confirm derived features match ground truth	Intrusive Investigation/ SOP AGCMR-09	Evaluated for all recovered seed items	100% of predicted seed item positions < 10 inches from known position	All QC seed item positions were within 4.0 inches of the known positions.
Classification performance	Intrusive Investigation/ SOP AGCMR-09	Evaluated for the final delivered dig list	100% of seed items classified as TOI	All seed items were classified as TOI.
Classification validation	Intrusive Investigation/ SOP AGCMR-09	For each delivered dig list	100% of predicted intrusively investigated non-TOI are confirmed to be non-TOI	All predicted intrusively investigated non-TOI were confirmed to be non-TOI.

4.3 Instrument Verification

On October 22, 2018, initial system operation was verified by acquiring a system function test utilizing a small ISO-80, as described in SOP AGCMR-01 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). Transmit current levels were monitored in addition to verification of correct modeled location and library match of the ISO-80 test object. System assembly and verification were completed by the data acquisition geophysicist and overseen by the Project Geophysicist.

After completion of the instrument tests, an initial static IVS survey was performed, also on October 22, 2018, as described in SOP AGCMR-02 (Appendix B of the AGCMR-QAPP

[KEMRON, 2016b]), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). The IVS consisted of 2 small ISO-80s and 1 blank location. One small ISO-80 was buried vertically, 15cm below ground surface (to the center of mass of the ISO), and the second small ISO-80 was buried horizontally, 10cm below ground surface (to the center of mass of the ISO). The IVS location and layout are shown on Figure 3, and the IVS Memorandum is provided in Appendix B.

Ongoing verification of the MM2x2 system performance was conducted through IVS surveys prior to and after completion of daily data acquisition activities.

5 DATA VERIFICATION AND VALIDATION

Data verification and validation activities were conducted throughout the course of the MEC removal data acquisition, processing and analysis, and intrusive investigation activities. Verification and validation activities are described in the Geophysical Classification Validation Plan (Appendix D) and summarized in the sections below. Results of the verification and validation investigations are presented in Section 5.3.

5.1 Quality Assurance Validation Seeding

The USACE QA Geophysicist placed an unknown number of blind subsurface QA validation seed items across the subsurface removal area prior to the MM2x2 investigation. QA validation seed items consisted of small ISO-80 and were placed at depths between 6 and 12 inches below ground surface. QA validation seed items were emplaced by a UXO Technician not otherwise involved in the subsurface MEC removal, and burial information was recorded by the QA Geophysicist. The integrity of the QA validation seeding program was maintained by keeping QA validation seed item information unknown to the data acquisition, processing and analysis, intrusive investigation, and QC personnel until the initial classification results were submitted and the successful identification of all QA validation seed items was confirmed by the QA Geophysicist.

The USACE QA Geophysicist has verified that all QA validation seed items were successfully detected during the dynamic detection survey and that all but one (discussed below) were selected as targets for the static classification survey in the grids that have been completed to date. 64 QA validation seed items were successfully classified as potential TOI, identified for subsurface removal on the ranked classification dig list, and recovered during subsurface removal operations in accordance with the seed item recovery MQO established in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). Additional QA validation seed items are located in the fuel break grids remaining to be completed under a future contract on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). Information for the QA validation seed items buried in these grids has not been revealed to KEMRON, however, the USACE QA Geophysicist has confirmed that these seed items were correctly identified and classified during the MM2x2 investigation and have been included in the list of intrusive investigation locations that remain to complete the subsurface removal.

On January 16, 2020, the USACE QA Geophysicist advised KEMRON that one QA validation seed item (QAS-009), located in grid OR069 on Orion Road, was incorrectly classified as a non-TOI during the MM2x2 investigation, resulting in a failure of the "classification performance" MQO in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c). The location, depth, and orientation of the incorrectly classified validation seed item were provided to the QC Geophysicist in accordance with the MQO failure response to conduct a root cause analysis (RCA). The RCA and corrective action (CA) are discussed in Section 5.2.

5.2 Root Cause Analysis and Corrective Action

5.2.1 Root Cause Analysis

An RCA was conducted by the geophysical team to evaluate the cause of the misclassified QA validation seed QAS-009, and a CA was implemented to correct the error and to prevent future recurrence of the issue. The RCA determined that the initial cued data acquisition over the target resulted in a modeled dig location that was 45 cm from the center of the MM 2x2 sensor array. This was just beyond the "confirm inversion model supports classification" MQO of 38 cm from the center of the MM 2x2 sensor array. In accordance with the MQO in Worksheet 22 of the AGCMR-QAPP (KEMRON, 2016b), as modified for MM2x2 by FWV 012 (KEMRON, 2018c), this target was selected for recollection at a location closer to the modeled source of the anomaly.

Prior to final target classification, all data to be considered in the classification decision-making process must be re-imported into the processing software. When a target measurement is recollected, standard practice is to import all cued measurements for that target that have not been flagged as having poor data quality. For the target associated with QAS 009, the data analyst imported the second cued measurement for consideration during final classification but did not import the original cued measurement. In this case, the original cued reading exhibited higher overall data quality and was a more obvious match for a TOI than the redo measurement, which was acquired over rougher terrain near the anomaly location. The size, shape, and decay characteristics of the original cued target measurement meet the criteria for upgrading the target to the "dig" portion of the ranked target list, but the characteristics analyzed from the second cued target measurement did not.

The root cause of the QA failure was determined to be analyst error in not following the standard procedure of including the original cued target measurement (if of sufficient data quality) along with the recollected target measurement in the final classification analysis.

5.2.2 Corrective Action

A corrective action was implemented to account for this failure and to prevent future recurrence of the issue. The corrective action included the review of all targets for which a recollected measurement was acquired among the classified ranked lists generated by this data analyst. For targets that were recollected and not selected for intrusive investigation, the data analyst implemented the following actions:

1. Determine if any cued target measurements were rejected for a reason other than a data quality problem;
2. If so, determine if those measurements were imported and considered during the classification decision;
3. If those measurements were not considered, import the valid measurements and re-evaluate the dig/do not dig decision;
4. If necessary, revise the dig list to include additional suspected TOI.

If new potential TOI were identified during the data review, they would be provided to the Site-Specific Data Manager and assigned to a dig team for intrusive investigation. 76 cued target measurements were reevaluated during the corrective action, but none resulted in the addition of potential TOI to the intrusive investigation list.

To prevent future recurrence of this issue, an additional check was added to the data processing and analysis routine for the data analyst to verify that appropriate cued target measurements of sufficient quality for classification analysis, both original and redo, are considered when making the final classification decision.

The completed root cause analysis and corrective action for the misclassified QA validation seed item is included in Appendix E. Upon completion of the root cause analysis and corrective action, the missed QA validation seed item was recovered from the supplemental subsurface removal area.

5.3 Classification Verification and Validation

Included in the targets selected for intrusive investigation and subsurface removal were verification and validation investigations. These verification and validation investigations included the following:

- 20 dynamic detection threshold verification investigations
- 186 library match threshold verification investigations
- 327 general QC verification investigations
- 205 QA validation investigations

5.3.1 Dynamic Detection Threshold Verification

Intrusive investigation of 20 detected anomalies below the threshold for inclusion in the static classification survey was conducted to verify that the dynamic detection threshold was appropriately selected to identify subsurface anomalies potentially related to TOI. Reacquisition and intrusive investigation were conducted in the same manner as that of the targets classified as TOI. Intrusive investigation of the 20 dynamic detection threshold verification investigations resulted in the recovery of 1 40mm projectile MD item, 1 57mm projectile MD item, assorted MD

components, and 50-caliber small arms ammunition, but no TOI were recovered. This satisfied the requirement for intrusive investigation of anomalies below the dynamic detection threshold.

5.3.2 General Quality Control Verification

To verify the MM2x2 subsurface MEC removal process prior to finalization of classification thresholds, all targets, regardless of classification category, were intrusively investigated in three fuel break grids on Mercury Road (ME007, ME010, and ME020). One DMM item (40mm cartridge) was recovered from grid ME010. The DMM item was located on the surface and outside of the grid. The DMM find was incidental and has no impact on the QC verification investigations (Appendix F). In addition to the 110 standard intrusive investigation targets classified as potential TOI, 327 Category 3 targets (High-Confidence Non-TOI) were intrusively investigated as general QC verification investigations. Intrusive investigation of the 327 standard QC verification investigations resulted in the recovery of assorted MD components and 50-caliber small arms ammunition, but no TOI were recovered.

5.3.3 Library Match Threshold Verification

Intrusive investigation of 25 anomalies ranked immediately below the lowest-ranked TOI recovered from the ranked classification dig list was required to verify that the library match threshold was appropriately selected to identify TOI. Included in the dig list were 186 anomalies ranked lower than the last recovered TOI, each of which were investigated as part of routine intrusive investigation activities. Intrusive investigation of the 186 library match threshold verification investigations resulted in the recovery of assorted MD components and 50-caliber small arms ammunition, but no TOI were recovered. This satisfied the requirement for intrusive investigation of 25 anomalies ranked immediately below the lowest-ranked recovered TOI.

5.3.4 Modeled Depth Verification

The classification process resulted in a modeled depth of each Category 1 and Category 2 classified target (Category 0 targets do not have reliable modeled depths because the data could not be confidently analyzed). Verification of modeled TOI depths is built into the processing and classification scheme. Recovery depths of recovered items were recorded by the intrusive investigation team and compared to the modeled depths from the classification results to successfully verify that recovered TOI depths matched the modeled depths. The analysis of recovery depths for the Category 1 and Category 2 targets verified that the recovered items were within 6 inches of their modeled depths, including cases where a single anomaly source was related to more than one measured target.

5.3.5 Quality Assurance Validation Investigations

After completion of subsurface removal of the targets classified as TOI, the QA Geophysicist selected 205 QA validation investigations for reacquisition and intrusive investigation as overall validation of the classification process to confirm that MEC items have not been left in place. Reacquisition and intrusive investigation were conducted in the same manner as that of the targets classified as TOI. The 205 QA validation investigations, including investigation results, are listed in Appendix C. Intrusive investigation of the 205 validation investigations resulted in the

recovery of assorted MD components and 50-caliber small arms ammunition, but no TOI were recovered.

5.3.6 Verification and Validation Results

A total of 738 verification and validation investigations were completed. No TOI were recovered from the verification and validation investigations. Non-TOI MD items were recovered during the verification and validation investigations, including the following:

- 40mm projectile MD (1 item)
- 57mm projectile MD (1 item)
- Various assorted MD components

The successful completion of the verification and validation investigations constituted the final subsurface MEC removal process validation.

6 CONCLUSIONS

6.1 Supplemental Subsurface MEC Removal Results

A total of 23,023 anomalies were identified from the MM2x2 dynamic detection data that potentially represented subsurface MEC items in the supplemental subsurface MEC removal area in the Impact Area MRA fuel break system. The MM2x2 was utilized to acquire static classification data measurements over each identified anomaly. The MM2x2 data was inverted and analyzed to estimate the intrinsic physical features of each anomaly source, allowing a comparison of the measured data to a site-specific TOI signature library and classification of each anomaly as a TOI or a non-TOI.

The classification process resulted in the identification of 11,416 anomalies for intrusive investigation and subsurface removal (9,873 in the portions of the supplemental subsurface removal area where subsurface removal has been completed and 1,543 in the portions remaining to be completed under a future contract) and 11,607 anomalies as high-confidence non-TOI, or items not selected for intrusive investigation (6,477 in the portions of the supplemental subsurface removal area where subsurface removal has been completed and 5,130 in the portions remaining to be completed under a future contract). 213 TOI were recovered and removed during intrusive investigation of the 9,873 anomalies identified for subsurface removal in the portions of the supplemental subsurface MEC removal area completed under this contract, including 58 81mm mortar projectiles, 2 60mm mortar projectiles, 1 57mm projectile, 25 40mm projectiles, 3 37mm projectiles, 1 20mm projectile, 1 rifle grenade, 1 point-detonating fuze, 2 grenade fuzes, 47 QC seed items, 64 QA validation seed items, and 8 small ISO-80 seed items from a previously used IVS located in the supplemental subsurface removal area. One recovered MEC item was a cartridge, 40mm, practice M781 DMM. The DMM find was incidental and not considered a TOI. 28 of the recovered TOI MEC items were UXO items, including 24 projectiles, 81mm mortar, high explosive, M43 series; 1 projectile, 81mm mortar, high explosive, M374 series; 1 projectile, 60mm

mortar, high explosive, M49 series; 1 projectile, 37mm, low explosive, MK2; and 1 fuze, point-detonating, M51 series. The recovered TOI also included 66 MD items sufficiently intact for the MM2x2 to identify them as TOI. The recovered TOI MD items included 33 81mm mortar projectiles, 1 60mm mortar projectile, 1 57mm projectile, 25 40mm projectiles, 2 37mm projectiles, 1 20mm projectile, 1 rifle grenade, and 2 grenade fuzes. One missed QA validation seed item was also recovered and removed after completion of the corrective action described in Section 5.2.

In addition to the 28 recovered MEC items from the MM2x2 investigation, 2 MEC items, both UXO, were recovered during analog subsurface removal in data gaps in the MM2x2 survey, as discussed in Section 3.3.2. The recovered UXO items included 1 projectile, 81mm, mortar, smoke, white phosphorus, M375 series recovered in Nowhere Road grid NR155 and 1 projectile, 40mm, high explosive tracer, MK II series recovered in Orion Road grid OR073. These items are displayed on Figure 7.

No TOI were recovered from intrusive investigation of 738 verification and validation investigations, 552 of which were classified as high-confidence non-TOI and 186 which were already included in the ranked dig list but also served as QC verification inspections, demonstrating the validity of the classification process.

6.2 Accomplishment of Supplemental Subsurface MEC Removal Objectives

Based on the completion of the MM2x2 investigation and classification process, the associated removal of TOI, and the demonstrated absence of TOI remaining in the selected anomaly population, the supplemental subsurface MEC removal objective has been successfully met for the completed portions of the subsurface removal area. Intrusive investigation of 1,543 targets representing potential TOI (including QC and QA seed items) remains in order to fully complete the supplemental subsurface MEC removal. These targets are on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186).

DATE:	November 5, 2019

Prior to supplemental subsurface MEC removal geophysical classification activities in the Impact Area MRA fuel breaks at the Former Fort Ord, the remedial action area was seeded with subsurface quality control (QC) seed items to provide verification of data acquisition, processing and analysis, classification, and intrusive investigation performance. QC seeding was accomplished in accordance with Standard Operating Procedure (SOP) AGCMR-03 - Quality Control Seeding for Advanced Geophysical Classification in Appendix B of the *Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (AGCMR-QAPP; KEMRON, 2016) as modified for MetalMapper 2x2 (MM2x2) by FWV 012 (KEMRON, 2018).

QC seed items consisted of small schedule-80 industry standard objects (ISO). 78 QC seed items were buried 6 inches below ground surface in anticipation of encountering at least one seed item during each day of cued classification data acquisition. Seed items were emplaced by the QC Geophysicist and a UXO Technician II utilizing anomaly avoidance techniques and real-time kinematic global positioning system for location measurement and recording of burial information. QC seed item locations were camouflaged with dirt or vegetation to hide ground disturbance, and no QC seed items were placed in paved areas.

To maintain the integrity of the QC program, seed item burial information was not provided to personnel involved in data acquisition, processing, or intrusive investigation activities until

those activities were completed, the initial classification results were submitted by the Project Geophysicist to the USACE Quality Assurance (QA) Geophysicist, and the successful identification of all QC seed items was confirmed by the QC Geophysicist and the QA Geophysicist. QC seeding results are reported in the *Technical Information Paper, Supplemental Subsurface MEC Removal, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California*. Additional validation seed items were emplaced by the USACE QA Geophysicist, details of which were unknown to the contractor team at the time of field work. Details of the validation seeding program are also presented in the Supplemental Subsurface MEC Removal Technical Information Paper.

30 of the emplaced QC seed items were located on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). The supplemental subsurface MEC removal in these grids will be completed under a future contract, and QC seed item burial information is therefore not presented in this QC seeding report. Burial information for the 48 QC seed items located in the portions of the fuel breaks where the supplemental subsurface removal has been completed is included in **Table 1**, and seed item burial locations are displayed on **Figure 1**.

DATE:	March 23, 2020

At the onset of the advanced geophysical classification (AGC) activities for the supplemental subsurface munitions and explosives of concern (MEC) removal in the Impact Area Munitions Response Area (MRA) at the Former Fort Ord, the performance of the Geometrics MetalMapper 2x2 (MM2x2) was demonstrated using an instrument verification strip (IVS). Details of the MM2x2 system assembly, the IVS layout, the initial dynamic and cued IVS surveys, and the initial IVS survey results are presented in this memorandum.

1. MetalMapper 2x2 System Assembly and Verification

The MM2x2 is a person-portable advanced electromagnetic induction sensor designed for the detection and classification of buried metal objects. The MM2x2 is comprised of four co-planar transmitter coils oriented in a 2 by 2 square. Each transmitter coil is approximately 35 centimeters (cm) x 35 cm in size. Located in the center of each transmitter coil is a 10 cm x 10 cm x 10 cm receiver cube, each one containing three orthogonal coils to measure magnetic fields resulting in 12 different receiver coils. The receiver coils are oriented in 3 dimensions. The center-to-center distance of each receiver cube is approximately 40 cm. The transmitter coils are powered using a bi-polar half duty cycle, and the time decays of the subsurface currents (transients) are measured during the time that the transmitter coils are off. The sensors are mounted on a platform 20 cm above the ground surface. A real-time kinematic (RTK) global navigation satellite system (GNNS) and six-degree-of-freedom inertial measurement unit (IMU) are mounted on a tower centered above the sensor platform to provide positioning and orientation, respectively. The transmitter electronics and batteries are mounted on a backpack carried by the operator, and the system is operated from a tablet computer.

The MM2x2 system was assembled in accordance with Standard Operating Procedure (SOP) AGCMR-01 - Advanced EMI Sensor Assembly and Verification, which is located in Appendix B of the *Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (AGCMR-QAPP; KEMRON, 2016a), with modification for MM2x2 by Field Work Variance (FWV) 012 (KEMRON, 2018). Verification of system assembly, including inertial measurement unit orientation, RTK GNSS operation, data acquisition parameters, and system operation, was also conducted in accordance with SOP AGCMR-01 and is documented on the SOP AGCMR-01 Assembly Checklist.

The results of the MM2x2 static function test conducted with a small schedule 80 industry standard object (ISO80) met the acceptance criteria of the initial sensor function test, as demonstrated by the display of 4 delta values below the 2.000 threshold, indicating that the test results agreed with the reference values for each sensor. Note that the acceptance criteria for the initial function test measurement quality objective (MQO) in Worksheet #22 of the AGCMR-QAPP (KEMRON, 2016a), with modification for MM2x2 by FWV 012 (KEMRON, 2018), applies only to the alternate function test procedure if the built-in MM2x2 system function test cannot be utilized, as described in SOP AGCMR-01.

2. Instrument Verification Strip Construction

The Unit 4 AGC IVS was constructed for use during a previous AGC activity by the QC Geophysicist in accordance with SOP AGCMR-02 – Advanced EMI Sensor Instrument Verification Strip (AGCMR-QAPP; KEMRON, 2016a), with modification for MM2x2 by FWV 012 (KEMRON, 2018), in the south-central portion of Unit 4 in the impact Area MRA (**Figure 1**). Prior to emplacement of IVS seed items, a background digital geophysical mapping (DGM) survey of the IVS location was conducted with a person-portable Geometrics EM61-MK2A (EM61). The EM61 data were processed in accordance with GEO SOP 5 – DGM Data Processing for a PP System (Attachment B to the *Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action; KEMRON, 2016b*), and the IVS location was determined to be suitable for use.

Figure 1. Instrument Verification Strip Location

After verification that the IVS burial locations were free of metallic interference, the IVS seed items were placed at precisely measured depths and orientations at the locations listed in **Table 1**. Each IVS item location was recorded with a Leica Viva GS15 RTK-GNSS prior to burial. The IVS consisted of 2 small ISO80s and 1 blank location. One small ISO-80 was buried vertically, 15 centimeters (cm) below ground surface (to the center of mass of the ISO), and the second small ISO-80 was buried horizontally, 10cm below ground surface (to the center of mass of the ISO).

Table 1. IVS Location Information

Point ID	Easting[1]	Northing[1]	Item	Depth (cm)[2]	Orientation
Blank	5744818.18	2107274.16	N/A	N/A	N/A
SFIVS01	5744803.18	2107275.18	Small ISO80	10	Horizontal
SFIVS02	5744788.24	2107276.45	Small ISO80	15	Vertical

[1] Coordinates are reported in California State Plane, Zone 4, NAD83, US survey feet
[2] Depths are reported to the center of mass of the item below ground surface

3. Initial Instrument Verification Strip Surveys

An initial dynamic MM2x2 survey was conducted over the IVS on October 22, 2018, as described in SOP AGCMR-02 (Appendix B of the AGCMR-QAPP [KEMRON, 2016a]), as modified for MM2x2 by FWV 012 (KEMRON, 2018). The initial dynamic IVS survey was followed by static MM2x2 measurements, also on October 22, 2018, acquired at each IVS item location (SFIVS01 and SFIVS02) and at the blank location, in accordance with SOP AGCMR-02 (AGCMR-QAPP; KEMRON, 2016a), with modification for MM2x2 by FWV 012 (KEMRON, 2018). The blank

location, where no metallic item was buried, was used as a background measurement to record the components of the measured response caused by the ambient environment and by the MM2x2 system itself. During data processing, the background response was subtracted from the overall measured responses, leaving only the signal response from the small ISO80 buried at each IVS item location.

4. Initial Dynamic Instrument Verification Strip Survey Results

The dynamic MM2x2 IVS data were processed and analyzed in accordance with SOP AGCMR-06 – Advanced EMI Sensor Dynamic Data Processing and Analysis (AGCMR-QAPP; KEMRON, 2016a), with modification for MM2x2 by FWV 012 (KEMRON, 2018). The MM2x2 data files were imported into the UX-Analyze module within Geosoft's Oasis Montaj, where the quality of the measured data was verified prior to data processing and analysis. The initial dynamic MM2x2 IVS data is shown on **Figure 2**.

Figure 2. Initial Dynamic Instrument Verification Strip Survey

The initial detection locations of the IVS items were offset 0.4 inches (for SFIVS01) and 0.6 inches (for SFIVS02) from the item locations measured during construction of the IVS. The initial response amplitudes of the IVS items were within 6% (for SFIVS01) and 9% (for SFIVS02) of the predicted amplitudes.

5. Initial Static Instrument Verification Strip Survey Results

The static MM2x2 IVS data were processed and analyzed in accordance with SOP AGCMR-08 – Advanced EMI Sensor Cued Data Processing and Analysis (AGCMR-QAPP; KEMRON, 2016a),

with modification for MM2x2 by FWV 012 (KEMRON, 2018). The MM2x2 data files were imported into the UX-Analyze module within Geosoft's Oasis Montaj, where the quality of the measured data was verified and the background measurement acquired at the blank IVS location was subtracted from each target measurement.

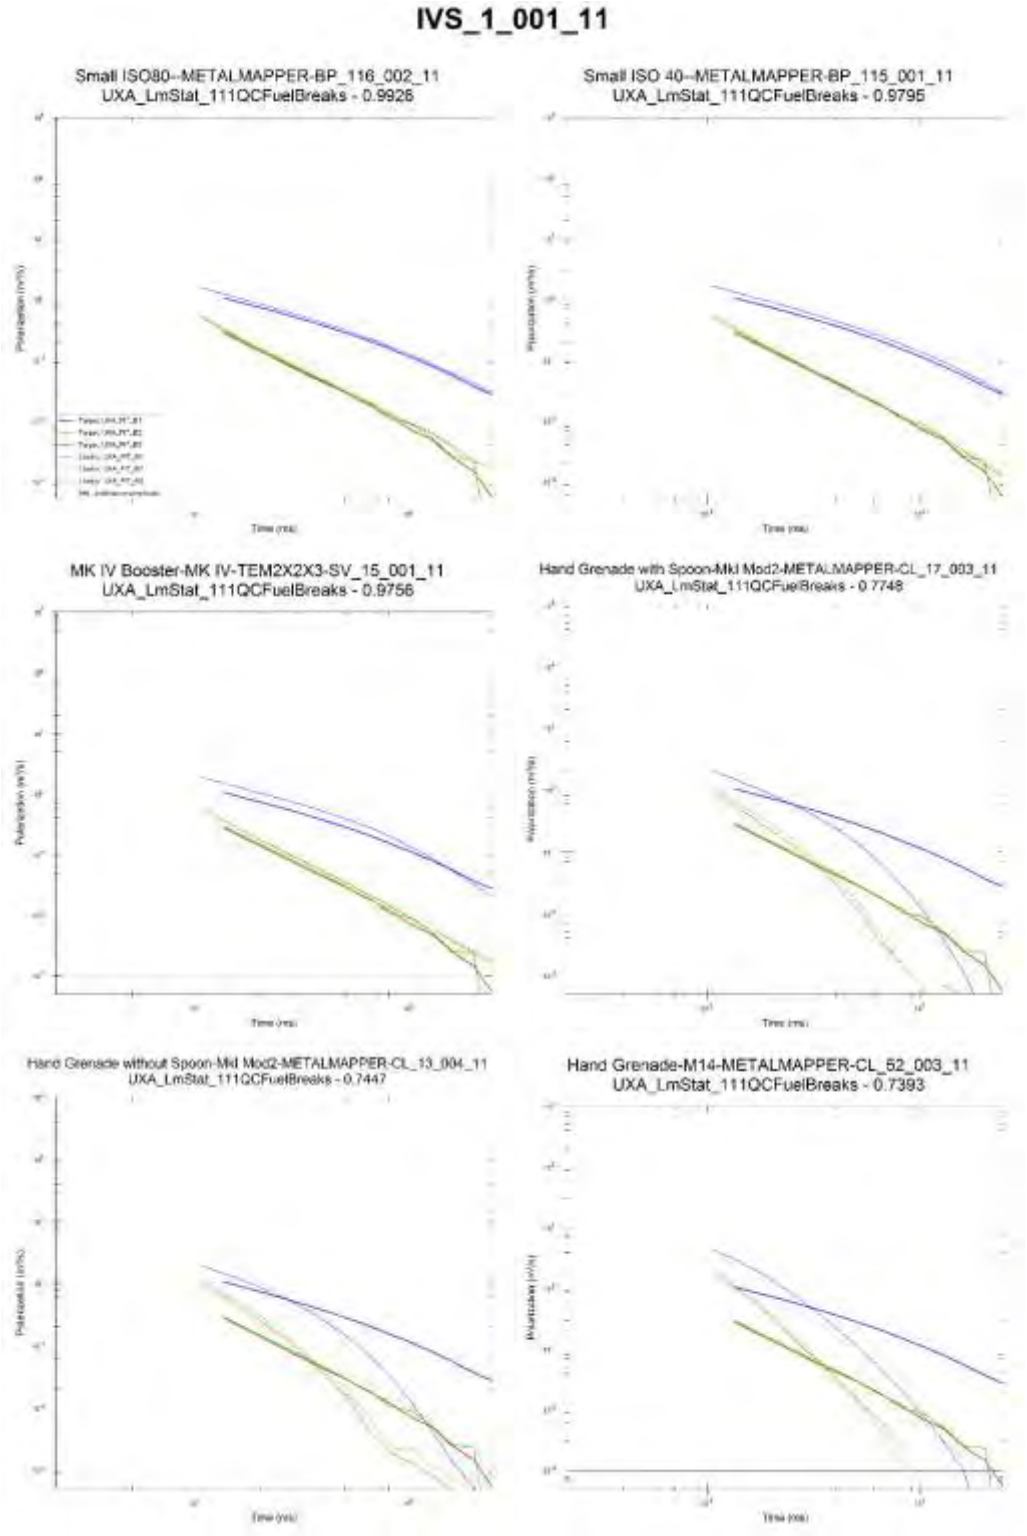
UX-Analyze estimates the features of each anomaly source through a dipole inversion process where a series of modeled dipole responses are compared to the measured data to determine the set of parameters that generates a response that best fits the observed data. If the modeled response closely matches the observed response (as indicated by the resulting fit coherence value), the parameters of that model can be used as estimates of the intrinsic features of the source (such as size, shape, and composition) as well as extrinsic features (such as position and orientation in the ground). The fit coherence is reported as a value between 0 and 1, where 1 is a perfect fit. The inversion modeling also estimates the physical location of each anomaly source.

For the initial cued measurements over each of the IVS items, the inversion modeled response closely matched the observed response, as indicated by fit coherence values of 0.940 (for item SFIVS01) and 0.919 (for item SFIVS02). The modeled locations the IVS items were offset 0.4 inches (for item SFIVS01) and 0.6 inches (for item SFIVS02) from the item locations measured during construction of the IVS.

The inversion of the MM2x2 data results in estimated intrinsic features of the measured items in the form of polarizabilities of the anomaly source item's three principle axes (β_1, β_2, and β_3). The derived polarizabilities are used to classify the IVS targets by matching them to a library of target of interest signatures. UX-Analyze generates a correlation metric, or decision statistic value, to compare the estimated polarizabilities of each measured item to the polarizabilities of the items in the classification library. Similar to the fit coherence value, the decision statistic is a value between 0 and 1, where 1 is an exact match between the measured item and a library item.

The library match for the cued measurement over IVS item SFIVS01 is shown on **Figure 3**, and the library match for the cued measurement over IVS item SFIVS02 is shown on **Figure 4**. The figures display the derived polarizabilities of the measured IVS items as solid blue, green, and red lines and those of the library items as dashed blue, green, and red lines. Both measurements resulted in close matches to a large ISO, with decision statistic values of 0.9756 (for item SFIVS01) and 0.9823 (for item SFIVS02).

Figure 3. IVS Item SFIVS01 Library Match Results



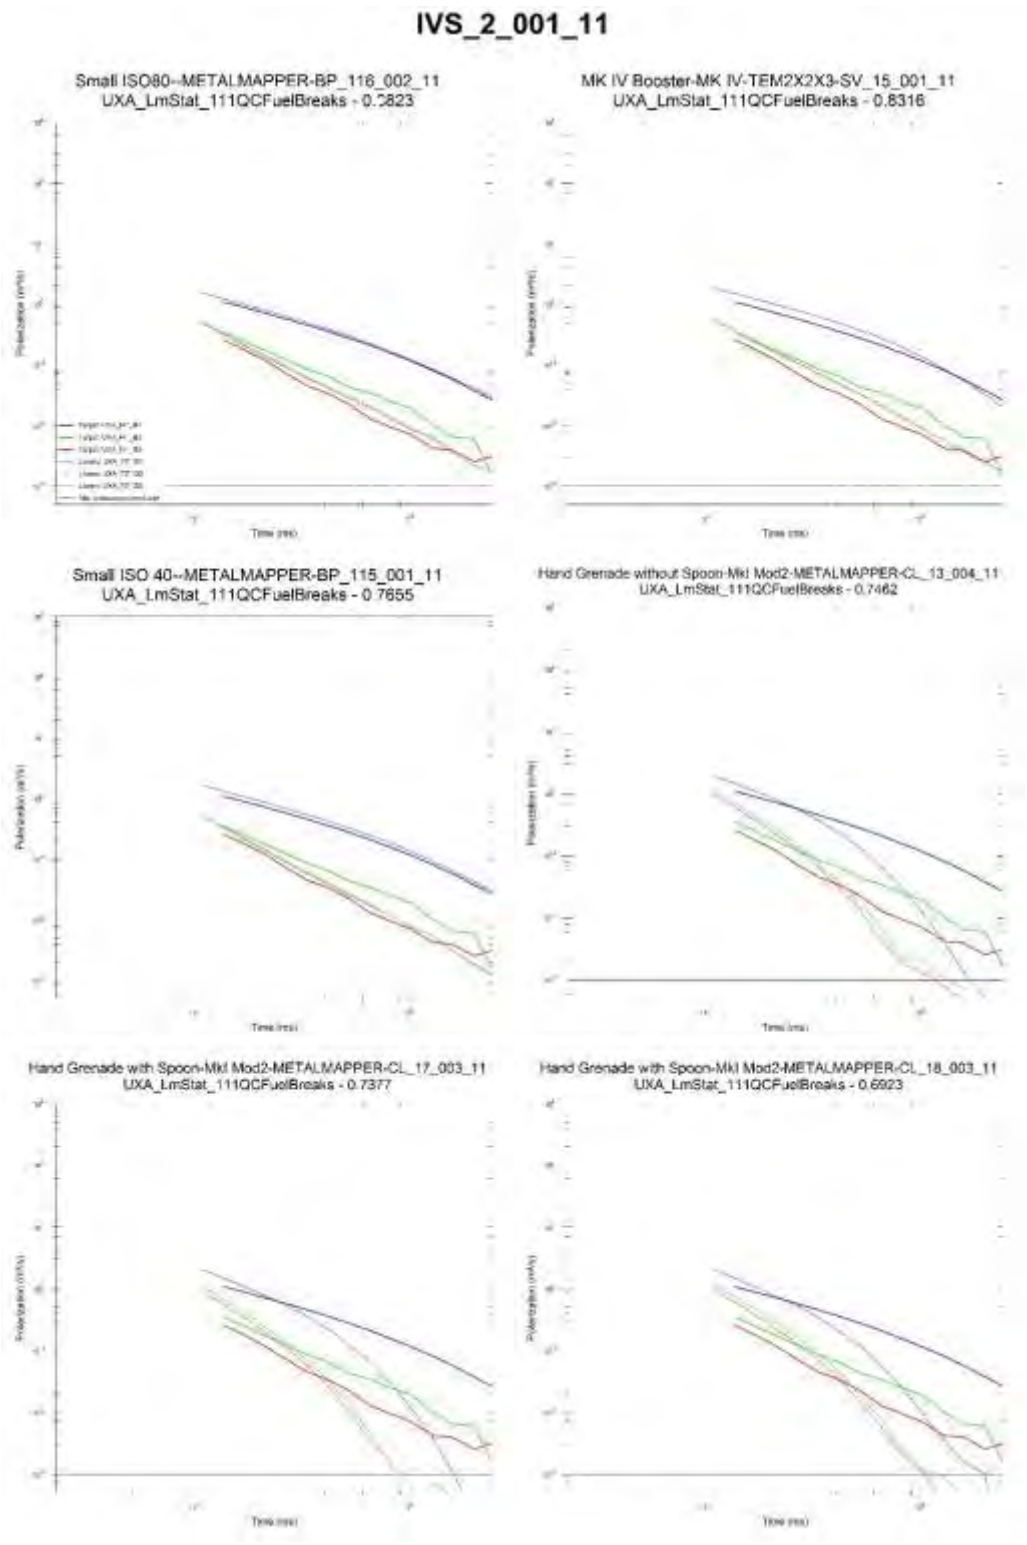


Figure 4. IVS Item SFIVS02 Library Match Results

Worksheet #22 in the AGCMR-QAPP (KEMRON, 2016a), with modification for MM2x2 by FWV 012 (KEMRON, 2018), defines the MQO and measurement performance criteria (MPC) related to the MM2x2 IVS survey measurements. The initial dynamic and static IVS survey results compared to the MPC are shown in **Table 2** and **Table 3**, respectively.

Table 2. Initial Dynamic Instrument Verification Strip Performance

IVS Item Measurement	Target Position Accuracy Requirement	Target Position Measurement	Response Amplitude Requirement	Response Amplitude Measurement
SFIVS01	≤10 inches	0.4 inches	≤25%	6%
SFIVS02	≤10 inches	0.6 inches	≤25%	9%

Table 3. Initial Cued Instrument Verification Strip Performance

IVS Item Measurement	Fit Coherence Requirement	Measurement Fit Coherence	Library Match Requirement	Measurement Library Match Metric	Derived Position Accuracy Requirement	Measurement Derived Position Accuracy
SFIVS01	>0.8	0.940	≥0.9	0.9756	≤10 inches	0.4 inches
SFIVS02	>0.8	0.919	≥0.9	0.9823	≤10 inches	0.6 inches

The MQO for the initial derived target position accuracy specifies a target position accuracy within 10 inches of the item locations measured during construction of the IVS. Both initial dynamic IVS measurements met the acceptance criteria for this MQO. The MQO for the initial detection response amplitudes specifies response amplitudes within 25% of predicted amplitudes. Both initial dynamic IVS measurements met the acceptance criteria for this MQO.

Worksheet #22 of the AGCMR-QAPP does not include an IVS-specific MQO for fit coherence between the modeled response and the observed response for each item but rather specifies a fit coherence MQO that applies to all static MM2x2 measurements. This MQO specifies a fit coherence greater than 0.8. Both initial static IVS measurements met the acceptance criteria for this MQO. The MQO for accuracy of the derived IVS polarizabilities specifies a library match correlation metric of at least 0.9. Both initial IVS measurements met the acceptance criteria for this MQO. The MQO for the initial derived IVS target position accuracy specifies that all IVS item fit locations are within 10 inches of the item locations measured during construction of the IVS. The derived position accuracies for the initial IVS measurements met the acceptance criteria for this MQO.

6. MetalMapper 2x2 Verification Results

As demonstrated in the preceding tables and figures, the MM2x2 system as tested at the Unit 4 AGC IVS is capable of meeting the MQOs in Worksheet #22 of the AGCMR-QAPP (KEMRON, 2016a), with modification for MM2x2 by FWV 012 (KEMRON, 2018), and, by extension, is able to achieve the overall data quality objectives of the supplemental subsurface MEC removal.

7. Conclusion

The supplemental subsurface MEC removal utilized the previously constructed AGC IVS in the south-central portion of Unit 4 in the Impact Area MRA at the Former Fort Ord to verify the functionality of the MM2x2 system, to demonstrate its ability to meet the MQO in the AGCMR-

QAPP (KEMRON, 2016a), with modification for MM2x2 by FWV 012 (KEMRON, 2018), and to achieve the data quality objectives of the supplemental subsurface MEC removal. Initial dynamic and static MM2x2 surveys were performed at the IVS on October 22, 2018. The results of the initial static function test and the initial dynamic and static IVS surveys successfully demonstrated the functionality of the MM2x2 system, its ability to meet the MQO defined in Worksheet #22 of the AGCMR-QAPP, and, by extension, its capability of achieving the overall data quality objectives of the supplemental subsurface MEC removal.
