Geophysical Classification Validation Plan

Geophysical Classification Validation Plan – Supplemental Subsurface MEC Removal, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California

PREPARED FOR:	Curtis Payton/USACE
	Kyle Lindsay/USACE
PREPARED BY:	Andy Gascho/Gilbane
COPIES:	Steve Crane/KEMRON
	Erin Caruso/Gilbane
	Jeff Sabol/KEMRON
	Alex Kostera/NAEVA
DATE:	March 3, 2020

This Geophysical Classification Validation Plan has been developed to describe procedures for verifying and validating the classification results of the supplemental subsurface munitions and explosives of concern (MEC) removal being performed in the Impact Area Munitions Response Area (MRA) at the former Fort Ord, California. The supplemental subsurface MEC removal is being conducted by KEMRON Environmental Services, Inc (KEMRON) for the United States Army Corps of Engineers (USACE) under Contract W912DY-10-D-0027, Task Order number CM01.

The supplemental subsurface MEC removal is being completed in accordance with the *Final Quality Assurance Project Plan, Superfund Response Actions Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* (KEMRON, 2016a); the *Final Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II, Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (AGCMR-QAPP; KEMRON, 2016b) as modified for MetalMapper 2x2 (MM2x2) by *Field Work Variance (FWV) 012 for Final, Work Plan, Munitions with Sensitive Fuzes Field Study, Former Fort Ord, California* (KEMRON, 2018a); the *Final Work Plan, Remedial Design (RD)/Remedial Action (RA), Track 3 Impact Area Munitions Response Area (MRA), Munitions and Explosives of Concern (MEC) Removal, Former Fort Ord, California* (RD/RA WP, USACE, 2009); the *Final Track 3 Record of Decision (ROD), Impact Area Munitions Response Area, Track 3 Munitions Response Site, Former Fort Ord, California* (Track 3 ROD; United States Department of the Army, 2008); and *FWV 017 for Final, Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* (KEMRON 2018b).

The intent of the verification and validation process is to provide assurance that targets of interest (TOI) have been correctly classified and identified for removal and that no TOI have been classified as non-TOI. The verification and validation process will involve the following quality demonstrations:

- selection and intrusive investigation of verification and validation digs from the population of anomalies classified as non-TOI to demonstrate that anomalies have been correctly classified
- verification of modeled TOI depths

This plan presents the rationale for the verification and validation approach and the description of the verification and validation process. The identity, quantity, and distribution of intrusive investigations necessary to verify and validate the classification process has been determined during the course of classification activities and is based on specific details of the classification approach, intrusive investigation results, and the classification performance demonstrated by quality control (QC) and quality assurance (QA) seed item identification.

1. Background

The supplemental subsurface MEC removal in the Impact Area MRA fuel breaks, as described in *Technical Information Paper, Supplemental Quality Control Investigation, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California (Supplemental QC Investigation TIP), which is included in FWV 017 (KEMRON, 2018b)* was conducted to address the possibility of MEC items remaining in portions of the Impact Area MRA fuel breaks (totaling 25.5 acres) where the following three conditions are met:

- Analog subsurface removal actions performed prior to the Track 3 ROD
- High pre-analog survey anomaly density
- Previously recovered 81mm mortar projectiles

This included portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road. The supplemental subsurface MEC removal area is shown on **Figure 1** and was conducted primarily by advanced geophysical classification (AGC) with the MM2x2 and subsurface investigation and removal of anomalies classified as potential targets of interest (TOI). Two of the fuel break grids, one on Nowhere Road and one on Orion Road, which contained EM61-MK2 subsurface anomaly densities greater than 2,000 anomalies per acre, were completed using analog subsurface MEC removal prior to the MM2x2 investigation.

The MM2x2 investigation included a dynamic detection survey, in which subsurface anomalies were identified for investigation in the follow-on static MetalMapper 2x2 classification survey. Once an anomaly is identified and a static MM2x2 measurement is acquired, the anomaly can be classified as a potential TOI if it meets any of the following criteria:

1. Its derived polarizabilities (βs) match those of any TOI in the classification library
2. It is a member of a cluster or group of anomalies with similar (βs) that are identified as TOI through intrusive investigation
3. Its derived βs indicate features that are typical of TOI (large, axial symmetry, and thick-walled)

The goal of the verification and validation process is to demonstrate that no TOI are classified as non-TOI. The above criteria can be restated in terms of how anomalies are classified as non-TOI. An anomaly is classified as a non-TOI if it meets any of the following criteria:

1. Its derived polarizabilities do not match those of any TOI in the classification library
2. It does not belong to an identified cluster of anomalies with similar βs that are identified as TOI through intrusive investigation
3. Its derived βs indicate that it is not large, axially symmetric, and thick-walled

The following discussion presents the approach to classification verification and validation with emphasis on describing what thresholds will be tested and the rationale for these tests. Any verification and validation failures will require a root cause analysis and appropriate corrective action developed and implemented in consultation with the USACE.

2. Verification and Validation

In addition to blind QC seeding and QA validation seeding, which are described in the body of *Technical Information Paper, Supplemental Subsurface MEC Removal, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California*, the verification and validation process includes additional intrusive investigations and the following inspections:

- dynamic detection threshold verification
- general QC verification
- library match threshold verification
- modeled depth verification
- QA validation

2.1 Dynamic Detection Threshold Verification

Verification of the dynamic detection threshold will involve sampling through intrusive investigation of anomalies from the MM2x2 dynamic detection survey with amplitudes lower than the target selection threshold. 20 below-threshold anomalies will be selected from the dynamic detection survey data and intrusively investigated to achieve verification of the detection threshold.

Intrusive investigation of 20 detected anomalies below the threshold for inclusion in the static classification survey was conducted to verify that the dynamic detection threshold was appropriately selected to identify subsurface anomalies potentially related to TOI. Intrusive investigation of the 20 dynamic detection threshold verification investigations resulted in the recovery of 1 40mm projectile MD item, 1 57mm projectile MD item, assorted MD components, and 50-caliber small arms ammunition, but no TOI were recovered. This satisfied the requirement for intrusive investigation of anomalies below the dynamic detection threshold.

2.2 General Quality Control Verification

To verify the MM2x2 subsurface MEC removal process prior to finalization of classification thresholds, all targets, regardless of classification category, will be intrusively investigated in three fuel break grids on Mercury Road (ME007, ME010, and ME020).

In addition to 110 standard intrusive investigation targets classified as potential TOI, 327 Category 3 targets (High-Confidence Non-TOI) were intrusively investigated as general QC verification investigations in the three test grids. Intrusive investigation of the 327 standard QC verification investigations resulted in the recovery of assorted MD components and 50-caliber small arms ammunition, but no TOI were recovered.

2.3. Library Match Threshold Verification

Classification is based primarily on the fit metrics generated by the Geosoft Oasis Montaj UX-Analyze module during a comparison of the polarization (β) values estimated for each surveyed anomaly and the β values in the classification library developed for the project. The fit metric indicates the fit correlation between an anomaly and the item in the library that best matches it. The fit metric ranges from 0 to 1, with a fit metric of 1 being a perfect match. The library fit analysis matches the following combinations of βs to those of the classification library TOIs:

1. β1, β1/β2, β1/β3
2. β1, β1/β2
3. β1/β2, β1/β3
4. β1

The confidence metrics for each fit combination are averaged to derive a decision metric. The library matching process is performed for each single-target model and every target in each of the multi-target models. For each measured anomaly, the highest value decision metric (i.e., most-likely TOI) from the combined set of single-solver and multi-solver targets is used as the decision metric for that anomaly.

Cut-off thresholds are determined based upon review of the decision metrics derived for known targets (QC seeds, bench measurements and training dig results) and are used to rank and classify the target list. Decision metric values above the thresholds are classified as potential TOI, and values below the decision metric thresholds are classified as non-TOI. The TOI library match decision metric thresholds are shown in **Table 1**.

Table 1
Target of Interest Library Match Decision Metric Thresholds

Category	Description	Decision Metric Lower Boundary	Additional Condition
1	High-confidence TOI	0.95	
2	Inconclusive	0.825	
2	Inconclusive	0.750	Low amplitude signal

Verification of the library match thresholds will involve sampling through intrusive investigation of anomalies beyond the selected Category 2 threshold. The number of digs required to achieve verification depends to a large degree on intrusive investigation results – in particular the results for the lowest-ranked anomalies that result in the recovery of TOI. To adequately verify the library match thresholds, the next 25 targets with library match decision metrics below the final TOI recovered from the ranked dig list will be intrusively investigated.

Included in the dig list were 186 anomalies ranked lower than the last recovered TOI, each of which were investigated as part of routine intrusive investigation activities. Intrusive investigation of the 186 library match threshold verification investigations resulted in the recovery of assorted MD components and 50-caliber small arms ammunition, but no TOI were recovered. This satisfied the requirement for intrusive investigation of 25 anomalies ranked immediately below the lowest-ranked recovered TOI.

2.4. Modeled Depth Verification

The classification process results in a modeled depth of each Category 1 and Category 2 classified target (Category 0 targets do not have reliable modeled depths because the data

could not be confidently analyzed). Verification of modeled TOI depths is built into the processing and classification scheme. Recovery depths of recovered items were recorded by the intrusive investigation team and compared to the modeled depths from the classification results to verify that recovered TOI depths matched the modeled depths. The analysis of recovery depths for the Category 1 and Category 2 targets verified that the recovered items were within 6 inches of their modeled depths, including cases where a single anomaly source was related to more than one measured target.

2.5 Quality Assurance Validation

In addition to the verification and validation investigations described above, the USACE QA Geophysicist will select 200 targets classified as high-confidence non-TOI from the final ranked classification list for intrusive investigation as overall validation of the classification process to confirm that MEC items have not been left in place. A validation failure will result if any TOI is recovered in the set of QA validation investigations.

After completion of subsurface removal of the targets classified as TOI, the QA Geophysicist selected 205 QA validation investigations (200 QA validation investigations plus 5 alternate investigation locations) for reacquisition and intrusive investigation. All 205 QA validation investigations were completed, resulting in the recovery of assorted MD components and 50-caliber small arms ammunition. No TOI were recovered from the QA validation investigations. This satisfied the requirement for intrusive investigation of 200 anomalies classified as high-confidence non-TOI.

3. Summary of Verification and Validation Investigations

The final identity, quantity, and distribution of intrusive investigations necessary to verify and validate the classification process has been determined during the course of classification activities and is based on specific details of the classification approach, intrusive investigation results, and the classification performance demonstrated by QC and QA seed item identification. The dynamic detection threshold verification process (**Section 2.1**) included intrusive investigation of 20 anomalies from the dynamic detection survey with response amplitudes below the target detection threshold; the general QC verification process (**Section 2.2**) included intrusive investigation of 327 anomalies classified as high-confidence non-TOI in three grids on Mercury Road; the library match verification process (**Section 2.3**) included intrusive investigation of 186 anomalies ranked lower than the last recovered TOI on the ranked dig list; and the QA validation process included intrusive investigation of 205 QA validation investigations selected by the USACE QA Geophysicist.

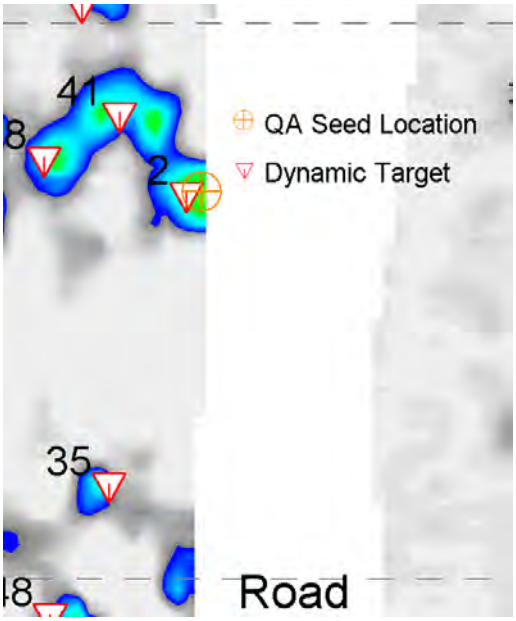
Misclassified Quality Assurance Seed Corrective Action Results

Root Cause Analysis and Corrective Action
Corrective Action Request: Quality Control Fuel Breaks 01



Introduction

On January 16, 2020, the KEMRON geophysical team was informed that quality assurance (QA) validation seed QAS 009, a schedule 80 small industry standard object (ISO), was misclassified as a non-target of interest (TOI), resulting in a failure of the "classification performance" measurement quality objective (MQO) in the *Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II, Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (AGCMR-QAPP).

Root Cause Analysis

Through review of the data associated with this seed item, it was determined that the small ISO was located slightly within a data gap on the west shoulder of Orion Road in the southern half of Grid OR069. However, dynamic MetalMapper 2x2 (MM 2x2) data were collected close enough to the item that it was detected within the "dynamic detection performance" MQO. The location of QAS 009 is shown as target 2 in Exhibit 1.

Exhibit 1. MetalMapper 2x2 Dynamic Detection Data

The dynamic detection target corresponding to QAS 009 was selected for inclusion in the cued MM 2x2 classification survey. The initial cued data acquisition over the target resulted in a modeled dig location that was 45 cm from the center of the MM 2x2 sensor array. This was just beyond the "confirm inversion model supports classification" MQO of 38 cm from the center of the MM 2x2 sensor array. In accordance with Worksheet #22 of the MEC-QAPP, this target was selected for recollection ("redo") at a

location closer to the modeled source of the anomaly. It should be noted that the data quality of the original cued measurement was not identified as problematic, and the sole reason for redo was the location of the initial cued measurement.

Prior to final target classification, all data to be considered in the classification decision-making process must be re-imported into the UX-Analyze module within Geosoft's Oasis Montaj. When a target measurement is redone, it is NAEVA's standard practice to import all cued measurements for that target that have not been flagged as having poor data quality. In the case of the target associated with QAS 009, the data analyst imported the second cued measurement for consideration during final classification but did not import the original cued measurement. In this case, the original cued reading exhibited higher overall data quality and was a more obvious match for a TOI than the redo measurement, which was acquired over rougher terrain closer to the data gap. The decay plots for both cued target measurements are shown in Exhibit 2 and Exhibit 3, at the end of the document. The size, shape, and decay characteristics of the original cued target measurement meet the criteria for upgrading the target to the "dig" portion of the ranked target list.

The root cause of the QA failure was determined to be analyst error in not following the standard procedure of including the original cued target measurement (if of sufficient data quality) along with the redo target measurement in the final classification analysis.

Corrective Action

The corrective action for this failure will be to review all targets for which a redo measurement was acquired among the classified ranked lists generated by this data analyst. For targets that were redone and not selected for intrusive investigation, the data analyst will implement the following steps:

1. Determine if any cued target measurements were rejected for a reason other than a data quality problem;
2. If so, determine if those measurements were imported and considered during the classification decision;
3. If those measurements were not considered, import the valid measurements and re-evaluate the dig/do not dig decision;
4. If necessary, revise the dig list to include additional suspected TOI.

New potential TOI identified during the data review will be provided to the Site-Specific Data Manager and assigned to a dig team for intrusive investigation. A short letter or email report will be provided to the USACE QA Geophysicist detailing targets reanalyzed and dig list revisions, if applicable.

Corrective Action to Prevent Future Recurrence

To prevent future recurrence of this issue, an additional check will be added to the data processing and analysis routine for the data analyst to verify that appropriate cued target measurements of sufficient quality for classification analysis, both original and redo, are considered when making the final classification decision.

Subject: Misclassified QA seed corrective action results
Attachments: Targets_Final_Comparison.xlsx

Hi Kyle.

To follow up on the corrective action for the misclassified QA Seed, NAEVA compiled the new classification results for targets impacted by the corrective action in the grids on Orion Road that are being dug on this contract (OR062-OR085). Those results are attached.

As a quick summary, the only target that was moved from Category 3 to a category that would require digging is the QA seed that started the whole thing, so there are no other additions to the current dig list based on this corrective action. There were other targets that showed an improved decision statistic after considering other measurements, but in each case, the improvement was so small that it did not move the target to a higher category. This supports our initial thought that this was a "one-off" incident influenced by the position of the seed relative to the data gap.

Loren will repeat this exercise for the other ranked lists on Orion Road and Watkins Gate Road, but since those won't be dug right now, we wanted to get these targets resolved first. Please let me know if you have any questions or concerns.

Thanks,
Andy

Subject: RE: Fort Ord validation seed CAR results

[EXTERNAL]

Hi Andy,
The following columns in the spreadsheet are the results of the classification of the readings that were not imported in to the initial classification lists.

- UXA_FIT_X
- UXA_FIT_Y
- UXA_TARGET_ID
- UXA_FLAG_ID
- UXA_Rank
- New UXA_category
- New UXA_decision_statistic
- UXA_UXOTYPE
- UXA_SIG_AMPLITUDE
- UXA_FIT_COH
- UXA_diff_array_fit_SCF
- UXA_COMMENTS
- UXA_COMMENTS_2
- UXA_CLUSTER_ABOVETHRESH
- UXA_CLUSTER_ID
- UXA_UNIQUE_SIGNATURE

The UXA_category and UXA_decision_statistic were compared with the results from the initial classification list (ie alternate reading taken at the flag). The initial classification list category and decision statistic are in these columns

- Original Classified UXA_category
- Original UXA_decision_statistic

And an additional text field with a brief description of the comparison, “Comparison of redone values to original decision stat”, is included.

For the mis-classified seed on the initial classified list the decision stat was 0.746469663 and the flag was in category 3 and data from the reshot only was considered. For the re-analysis the initial measurement at the flag was used and a solution that was just outside of the MQO for array to fit (source) offset but has a high decision statistic and good visual overlay of modeled betas to a small ISO was used; the decision stat for that measurement is but 0.940409634245363 and the flag being classified/ranked in category 2. Due to the offset of the fit location to the array center it did require a manual move by the analyst to be placed in category 2 which is supported by the high decision stat and visual appearance of the betas.

Let me know if this covers what you need.
Thanks,
Alison

Appendix F
Memorandum: Fuel Break TIP, Volume 2 – MEC Data Discrepancy (Grid ME010)

MEMORANDUM

TO: Department of the Army, Base Realignment and Closure (BRAC) – Fort Ord

FROM: Kyle Lindsay, Geophysicist, Geology Section, USACE Sacramento District

RE: Fuelbreak TIP, Volume 2 – MEC data discrepancy

DATE: 6 June 2021

On September 14, 2020 BRAC personnel identified a data discrepancy between the Fort Ord MMRP database and the Draft Fuel Break Technical Information Paper (TIP), Volume 2 regarding a 40mm cartridge (practice, M781, discarded military munition (DMM)) discovered in grid ME010 (Mercury Road, grid 10). In grid ME010, the report lists the item as being found at 0" depth with Unique ID=2155274, while the database lists the item as being found at 7" depth with Unique ID=2155275. The two items also had unique location coordinates but were only separated by 1.7" (Table 1). It was unclear whether two separate MEC items had been identified or if these were the same MEC item with incorrect information (depth, Unique ID, and location coordinates) recorded for one of the entries.

	Initial OE Item Description	Quantity	Depth (in.)	Date	Unique ID	X (SP)	Y (SP)
Draft Fuel Break TIP, Vol. 2	Cartridge, 40mm, prac, M781	1	0	01/08/2019	2155274	5749101.14	2111297.01
MMRP Database	Cartridge, 40mm, prac, M781	1	7	01/08/2019	2155275	5749101	2111297

Table 1. Item description discrepancy between Fuel break TIP, Vol. 2 and the Fort Ord MMRP database.

The dig results database for Mercury Road show two items being recovered at a single target ID for the item in question (Figure 1). It is not uncommon in high-density areas for multiple items to be present at a single target (anomaly) location. In such instances, cued advanced geophysical classification (AGC) surveys model multiple sources, with each source receiving a Unique Target ID. In this case for example, a single target (ME010-30051) would be identified from the dynamic survey, with the follow-on cued measurement modeling two different subsurface sources that together made up the anomaly. Each modeled source would then be assigned a Unique Target ID (ME010-30051 and ME010-30051-1).

The Senior Project Geophysicist and USACE Project Geophysicist reviewed the data and found that only a single modeled source was identified for intrusive investigation at Unique Target ID 30051. That source was estimated to be 10 inches below ground surface, located just inside the northern grid boundary, and had a low likelihood of being a Target of Interest (TOI) with a decision statistic of 0.78289 (Figure 2). The recovered item identified as MD (Unique Target ID ME010-30051) was found 7 inches below ground surface, fitting quite well with the cued measurement prediction.

Figure 1. Dig results database for Mercury Road. Items with data discrepancies discussed in this appendix are highlighted in yellow. Note that "Unique Target ID" field is different from the "Unique ID" field used in the MMRP database and listed in Table 1.

The second recovered item (40mm cartridge with Unique Target ID ME010-30051-1) doesn't fit to any of the modeled sources in the cued measurement at that location. It was located on the surface and was found outside the grid boundary. Generally, when the dig team finds multiple items at one flag location, the more important item recovered (in this case the DMM) is listed as the primary item in the dig results, and the secondary recoveries (MD for instance) get the "-1" or "-2" suffix appended to the Unique Target ID. This was not the case in this instance, where the dig team listed the MD as the primary recovery. This, coupled with the fact the 40mm cartridge (DMM) was found on the surface and outside the grid boundary, indicates that the MD (Unique Target ID ME010-30051) was the item identified by the cued measurement, and the DMM (Unique Target ID ME010-30051-1) should have been reported as an incidental find outside of the removal area.

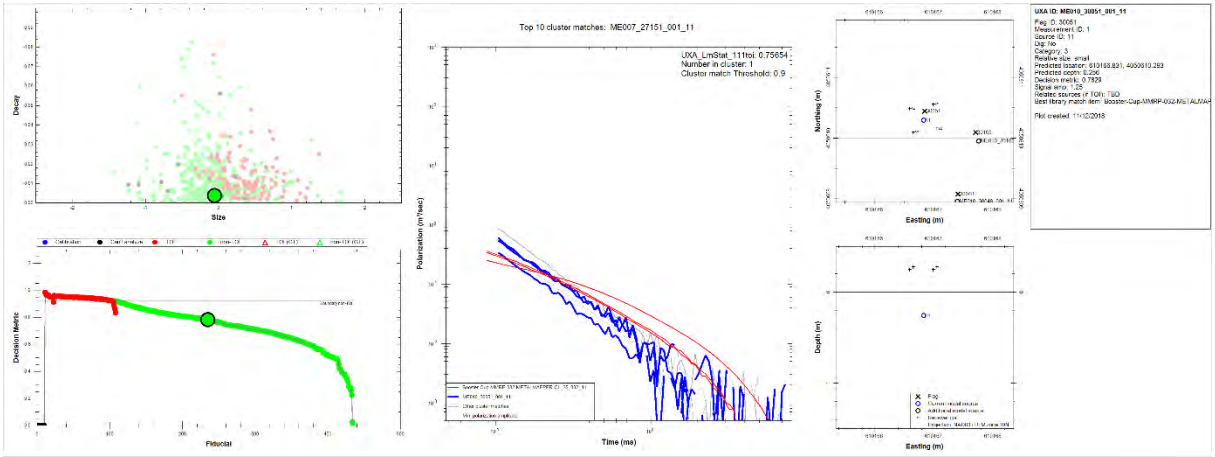

Figure 2. Classification decision plot for target ME010-30051.

As part of quality control verification, all targets, regardless of classification category, were intrusively investigated in three test grids on Mercury Road (ME007, ME010, and ME020). Intrusive investigation and subsurface removal of all targets, regardless of classification category, identified in three tests grids on

Mercury Road (ME007, ME010, and ME020) began December 17, 2018, and were completed January 10, 2019. These investigations included 437 targets. Data analysis, classification, and ranking of the remaining static MM2x2 measurements began after analysis of these dig results. The DMM item (40mm cartridge) was recovered on the surface and outside of Grid ME010. The DMM find was incidental and has no impact on the QC verification investigations described in Appendix D.

Grid ME010 is bordered on the north by Unit 11 grids A3J4C6, A3J4C7, A3J4D6, and A3J4D7 (Figure 3). Surface removal of grids A3J4C6, A3J4C7, A3J4D6, and A3J4D7 was performed in the fall of 2011. Surface removal and associated Quality Control (QC) and Quality Assurance (QA) activities are documented in the *Final, MRS-BLM Units 4, 11, and 12, Munitions and Explosives of Concern Remedial Action Report* (AR# OE-0799B). All grids that were subject to surface clearance passed QC and QA inspection. Figure 4 shows the Fort Ord MMRP Database entry for these four grids, indicating the grids passed QA inspection on October 18, 2011.

The incidental DMM item was found seven years after the surface clearance was performed and was found next to the edge of a fuel-break, which can be susceptible to erosion. Given these considerations, it's likely the incidental DMM find was exposed by erosion and/or other natural factors (e.g. dug up by wildlife). Analog surface removal (collected in 2011) and geophysical data (collected in 2018) passed Quality Control and Quality Assurance inspections, and there is no impact to the usability of these data.

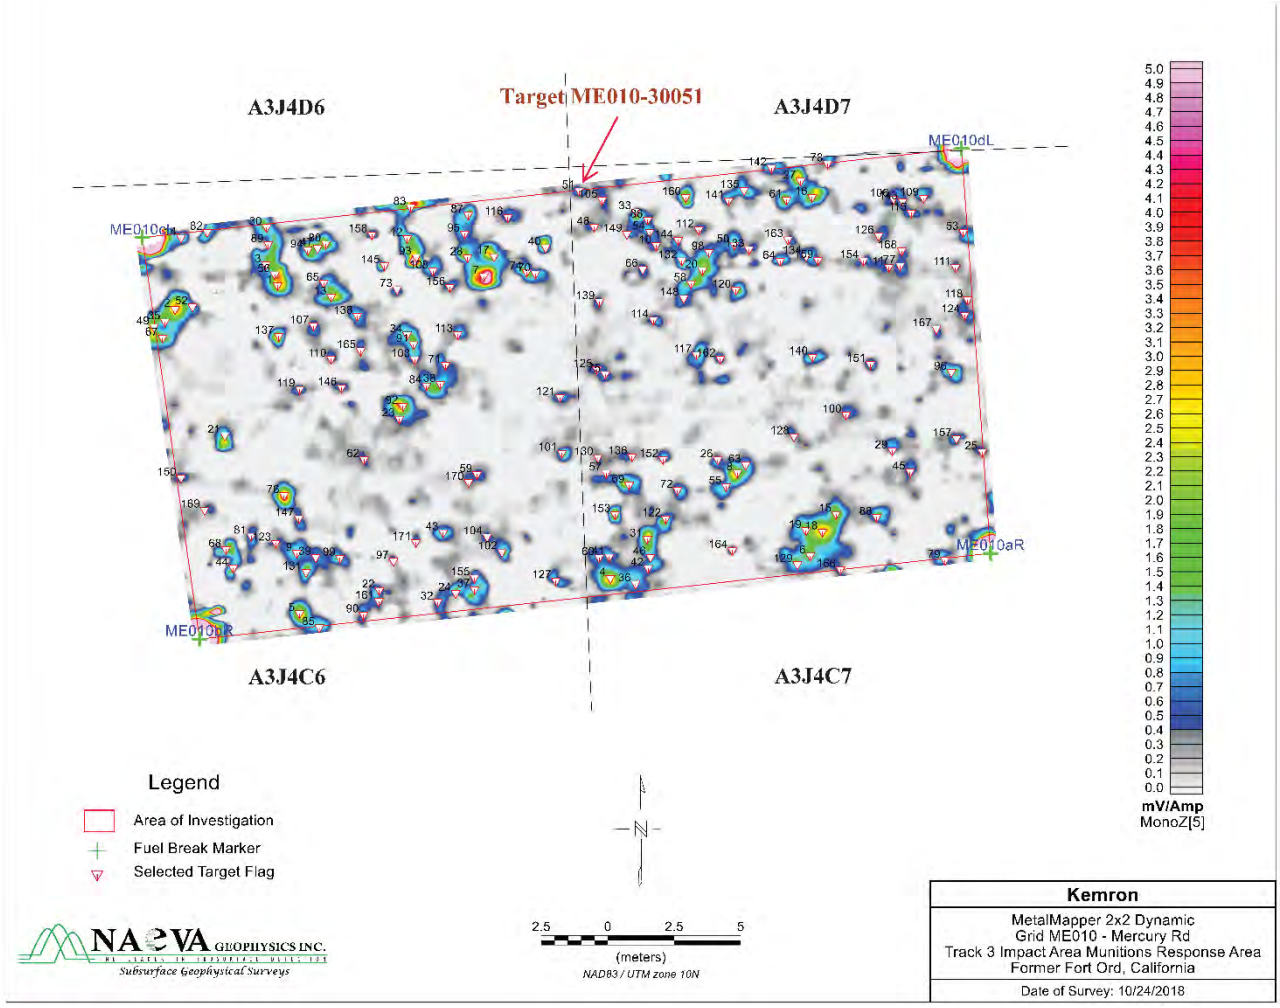

Figure 3. Dynamic AGC data collected in fuel-break Grid ME010. Unit 11 grid IDs are shown in black text.

Executive Summary

This Technical Information Paper (TIP) describes the work elements and results of supplemental subsurface MEC removal conducted in 2023 within a portion of Orion Road and Watkins Gate Road in the Impact Area Munitions Response Area (MRA) permanent fuel break system at the former Fort Ord, California. This fieldwork represents the final phase of MEC removal in the permanent fuel break system and addressed approximately 10 acres of the larger effort, which encompassed portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road, totaling 25.5 acres.

To address the possibility of munitions and explosives of concern (MEC) items remaining in portions of the Impact Area MRA fuel breaks, additional subsurface MEC removal was recommended[1] in areas within the fuel break system (totaling 25.5 acres) where the following three conditions are met:

- Analog subsurface removal actions performed prior to the Track 3 Record of Decision
- High pre-analog survey anomaly density
- Previously recovered 81-millimeter (mm) mortar projectiles

This includes portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road. Figure 1 presents the Impact Area MRA Fuel Break system. As of November 21, 2023, the 25.5 acres of supplemental subsurface MEC removal is complete.

The supplemental subsurface MEC removal was conducted primarily by implementation of advanced geophysical classification (AGC) techniques using the MetalMapper 2x2 (MM2x2) and subsurface investigation and removal of anomalies classified as potential targets of interest (TOI).

The MM2x2 investigation included a dynamic detection survey, in which 23,023 subsurface anomalies were identified for investigation in the follow-on static MM2x2 classification survey. The MM2x2 survey occurred in the period of October 2018 to April 2019, and the static classification survey took place during the period of November 2018 to November 2019. The classification survey resulted in the identification of 11,416 anomalies for intrusive investigation and subsurface removal and 11,607 anomalies as high-confidence non-TOI, or items not selected for intrusive investigation.

In 2020, the majority of the supplemental subsurface MEC removal was completed prior to the end of the KEMRON Environmental Services, Inc (KEMRON) task order at the Former Fort Ord. The results of the 2020 supplemental subsurface MEC removal are documented in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks*

[1] DRAFT FINAL Volume 1, Technical Information Paper Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California (KEMRON, 2021)

Impact Area Munitions Response Area Former Fort Ord, California (KEMRON, 2021a).

In 2023, the remaining portion of recommended supplemental subsurface MEC removal was completed under the *Site Specific Work Plan Fuel Breaks Supplemental Subsurface Munitions and Explosives of Concern Removal, Impact Area Munitions Response Area Former Fort Ord, California Orion Road and Watkins Gate Road* (KEMRON, 2023a). This Site Specific Work Plan (SSWP) outlines the site-specific procedures for munitions response to complete the supplemental subsurface MEC removal in the Impact Area MRA Fuel Break System (portions of Orion and Watkins Gate Roads). The remaining intrusive investigations included 1,543 targets representing potential TOI and their associated quality control (QC) and quality assurance (QA) seed items. These remaining anomalies were located on Orion Road north of Hawkeye Road (grids OR086-OR135) and Watkins Gate Road (grids WG146-WG186). These grids are shown in Figure 2. This investigation resulted in the recovery of 110 actual TOI from 1,825 target locations, including nine material potentially presenting an explosive hazard (MPPEH) items. These nine MPPEH items were destroyed by detonation and determined to be eight unexploded ordnance (UXO) items and one munitions debris (MD) item. The recovered TOI also included five MD items sufficiently intact (i.e. having the requisite size, symmetry, and wall thickness) for the MM2x2 to identify them as TOI, 30 QC seed items, 66 QA seed items. Three additional MPPEH items were recovered during analog subsurface removal in data gaps in the MM2x2 survey. These three MPPEH items were destroyed by detonation and determined to be three UXO items.

To demonstrate the success of the supplemental subsurface MEC removal, the library match verification process (Appendix B, Section 3) resulted in 200 verification investigations and the United States Army Corps of Engineers (USACE) QA Geophysicist added 200 validation investigations. No TOI were recovered from the verification and validation investigations, successfully demonstrating effectiveness of the remedial action (RA).

Technical and procedural details of supplemental subsurface MEC removal on Orion Road and Watkins Gate Road are presented in this report.

1.0 Introduction

This technical information paper (TIP) describes the work elements and results for the supplemental subsurface MEC removal conducted within portions of Orion Road and Watkins Gate Road in the Impact Area MRA permanent fuel break system at the former Fort Ord, California. The MEC removal was performed by KEMRON for the USACE under the Fort Ord MEC Interim Support Single Award Task Order Contract (SATOC), Contract Number W9123820D0004, Task Order Number W9123822F0043. This work was completed in accordance with the following documents:

- *Final Track 3 Record of Decision, Impact Area Munitions Response Area, Track 3 Munitions Response Site, Former Fort Ord, California* [Track 3 ROD] (Army, 2008)
- *Final Work Plan, Remedial Design/Remedial Action, Track 3 Impact Area Munitions Response Area, Former Fort Ord* [RD/RA WP] (USACE, 2009)
- *Final, Site-Specific Work Plan, Munitions and Explosives of Concern Remedial Action, Non-Burn Areas, Former Fort Ord, California* [Non-Burn SSWP] (Shaw, 2010)
- *Final Quality Assurance Project Plan, Superfund Response Actions Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern Remedial Action* [MEC QAPP] (KEMRON, 2016)
- *Final Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II, Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (KEMRON, 2016b)
- *Remedial Design (RD)/Remedial Action (RA) Work Plan Update, Track 3 Impact Area Munitions Response Area (MRA) Munitions and Explosives of Concern (MEC) Removal, Former Fort Ord, California* [RD/RA WP Update] (KEMRON, 2018)
- *Final Quality Assurance Project Plan Superfund Response Actions Former Fort Ord, California Volume II Munitions Response Appendix B Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* [AGCMR-QAPP Addendum] (KEMRON, 2023)
- *Site Specific Work Plan Fuel Breaks Supplemental Subsurface Munitions and Explosives of Concern Removal, Impact Area Munitions Response Area Former Fort Ord, California Orion Road and Watkins Gate Road* (KEMRON, 2023a)

The AGCMR-QAPP Addendum (KEMRON, 2023) prepared in support of the USACE, Sacramento District, under the Fort Ord Interim MEC Support SATOC incorporates the Department of Defense Advanced Geophysical Classification Accreditation Program (DAGCAP) requirements. The AGC work discussed in this TIP was conducted at the Former Fort Ord prior to the requirement for DAGCAP accreditation. Future AGC work will be conducted by a fully DAGCAP-accredited geophysical classification organization.

1.1 Site Location and History

The former Fort Ord consists of approximately 46 square miles of land located in northwestern Monterey County, California. The Impact Area MRA consists of the 6,560-acre portion of the 8,000-acre historical Impact Area that is entirely within the natural resources management area described in the *Installation-Wide Multispecies Habitat Management Plan for Former Fort Ord, California* [HMP] (USACE, 1997) and is currently identified for transfer to the BLM.

Military activity at the former Fort Ord included the use of the site for cavalry, field artillery, and infantry unit training, including maneuvers and live-fire training operations, from 1917 through 1994. Munitions used at the former Fort Ord included artillery and mortar projectiles, rockets, guided missiles, rifle and hand grenades, training land mines, pyrotechnics, bombs, and demolition materials. Multiple firing ranges operated within the historical Impact Area, with weapon firing generally directed toward the center of the Impact Area.

Fort Ord was placed on the National Priorities List of Superfund sites by the U.S. Environmental Protection Agency in 1990. Remedial investigation (RI), feasibility study (FS), and RA activities at the former Fort Ord are being conducted under the Comprehensive Environmental Response, Compensation, and Liability Act of 1980. The former Fort Ord was selected in 1991 for Base Realignment and Closure, and the base was officially closed in September 1994.

The Army completed the *Final Track 3 Impact Area Munitions Response Area Munitions Response Remedial Investigation/Feasibility Study Former Fort Ord, California* (MACTEC, 2007) for the Impact Area MRA in 2007, followed by the *Track 3 ROD* (Army, 2008), *RD/RA WP* (USACE, 2009), and development of the *Track 3 RD/RA WP Update* (KEMRON, 2018) to guide future RA activities in the Impact Area MRA. The selected remedy for the Track 3 Impact Area MRA is Technology-Aided Surface MEC Remediation, With Subsurface MEC Remediation in Selected Areas and Land Use Controls.

The Impact Area MRA includes a system of permanent fuel breaks that also serve as access roads throughout the interior of the MRA as shown on Figure 1. The Impact Area MRA permanent fuel break system is based primarily on pre-existing Army fuel breaks designed to contain fires in the dense maritime chaparral caused by military training involving explosive weapons and ordnance.

Under the *Track 3 ROD* (Army, 2008), the selected remedy includes subsurface MEC removal on the fuel breaks. The fuel breaks were designed to be 45 to 50 feet wide and consist of a central road of 15 to 20-foot width, with areas cleared of vegetation 15 feet wide on each side of the road. The subsurface MEC removal actions have been conducted over time. Additional site background is provided in Section 2.0 of the *DRAFT FINAL Volume 1, Technical Information Paper Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021).

1.2 MEC-Related Activities and Data Collected Prior to the Supplemental Subsurface MEC Removal

The *Non-Burn Areas SSWP* (Shaw, 2011) documents the identified fuel breaks and access roads (Group 2 among the non-burn areas) within the Impact Area MRA which had generally undergone technology-aided surface MEC removal and some subsurface MEC removal prior to the Track 3 ROD. The Non-Burn Areas SSWP described the following tasks for Group 2:

- Conduct Digital Geophysical Mapping (DGM) survey
- In areas where subsurface MEC removal was not previously conducted, conduct subsurface removal utilizing the DGM data
- In areas where subsurface MEC removal was previously conducted, DGM data will undergo the QC and QA process presented in the SSWP. Anomaly reacquisition and intrusive investigation were not anticipated as part of the QC/QA process because previous work was completed with appropriate QC and QA, but they were allowed if deemed necessary. Subsequent *Field Work Variance (FWV*) *03-002* (Innovative Technical Solutions, Inc. , 2011) provided the following clarification: "In the areas where removal to depth was completed by [previous contractors], Shaw conducted a Category B DGM. The Non-Burn Areas SSWP discussed that QC digs would be conducted in the Category B DGM areas. Ten percent of anomalies will be chosen by the project geophysicists for QC digs."

The Non-Burn Areas SSWP defined the approximately 180-acre system of permanent fuel breaks on which 45-foot wide subsurface removal would be completed (excluding paved sections) as part of the RA. The supplemental QC investigation detailed in *Technical Information Paper, Supplemental Quality Control Investigation, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California* (Supplemental QC Investigation TIP), which is included in *FWV 017* (KEMRON, 2018d), was conducted in the subset of the system of permanent fuel breaks where subsurface removal was conducted prior to the Track 3 ROD and where DGM was subsequently conducted under the Non-Burn Areas SSWP. Some segments of the fuel break system were excluded from the investigation due to removal from the permanent fuel break system (approximately 16.5 acres), DGM and MEC removal to depth conducted under other remedial action activities (approximately 54.1 acres), or inaccessibility due to pavement cover and concrete culverts (approximately 1.4 acres). The portions of the Impact Area MRA permanent fuel break system included in the supplemental QC investigation totaled approximately 108 acres.

The supplemental QC investigation was conducted in three distinct phases, which are described in the Supplemental QC Investigation TIP (KEMRON, 2018a), with a 10% investigation of the DGM anomalies by ITSI-Gilbane in 2011-12 and in 2014, and with a 5% QC investigation of DGM anomalies in the remaining fuel break segments by KEMRON in 2017. Investigation of 1,822 subsurface anomalies resulted in the recovery of 36 MEC and MEC-like MD items, all but two of which were 81mm mortar projectiles. All recovered MEC and MEC-like MD items were located along the Riso Ridge Road, Mercury Road, Steep Road, Hawkeye Road, Orion Road, and Watkins Gate Road fuel breaks in the portions of the Impact Area MRA with the highest concentration of subsurface anomalies and where 81mm mortar projectiles had been recovered. While handheld

analog subsurface removals have proven effective and successful in many areas, the conditions along these portions of the Impact Area MRA fuel break system, specifically anomaly densities greater than 900 anomalies per acre and the potential presence of deep (greater than 2 feet depth) 81mm mortar projectiles (based on where they had been recovered in previous activities), appear to have led to the increased potential for MEC items to remain in the subsurface. The Supplemental QC Investigation TIP recommended additional subsurface MEC removal to address the possibility of MEC items remaining in portions of the Impact Area MRA fuel breaks.

The majority of this fieldwork is documented in the *DRAFT FINAL Volume 1, Technical Information Paper Fuel Breaks Impact Area, Former Fort Ord, California* (KEMRON, 2021). In 2020, the majority of the recommended supplemental subsurface MEC removal was completed prior to the end of the KEMRON task order at the Former Fort Ord. The results of the 2020 supplemental subsurface MEC removal are documented in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a). This TIP details the intrusive investigation of 1,543 targets representing potential TOI (including QC and QA seed items) located on Orion Road north of Hawkeye Road (grids OR086-OR135) and Watkins Gate Road (grids WG146-WG186). See Appendix C for the ranked target list.

1.3 Supplemental Subsurface MEC Removal Objectives

To address the possibility of MEC items remaining in portions of the Impact Area MRA fuel breaks, additional subsurface MEC removal was recommended in areas (totaling 25.5 acres) where the following three conditions are met:

- Analog subsurface removal actions performed prior to the Track 3 ROD
- High pre-analog survey anomaly density
- Previously recovered 81mm mortar projectiles

The areas recommended for supplemental subsurface MEC removal are summarized in Table 1. Figure 2 displays the supplemental MEC removal grids located on Orion Road north of Hawkeye Road (grids OR086-OR135) and Watkins Gate Road (grids WG146-WG186).Steep Road, which also met the above criteria for the supplemental subsurface removal, has been removed from the system of fuel breaks based on *FWV 015* (KEMRON, 2018c) and was therefore not included.

Table 1. Supplemental Subsurface Removal Summary (Totaling 25.5 Acres)

Fuel Break Segment	Grids	Width (feet)	Length (feet)	Area (acres)
Hawkeye Road	9	45	870	0.99
Impossible Canyon Road*	4	15	400	0.14

*Note: Impossible Canyon Road and Nowhere Road contain grids with both 15-feet and 45-feet widths.

1.4 Supplemental Subsurface MEC Removal Approach

As described in the *Technical Information Paper, Supplemental Quality Control Investigation, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California* (Supplemental QC Investigation TIP), and *FWV 017* (KEMRON, 2018d) the subsurface removal was conducted primarily by AGC with the MM2x2 and subsurface investigation and removal of anomalies classified as potential TOI. Two of the fuel break grids, one on Nowhere Road and one on Orion Road, which contained EM61-MK2 subsurface anomaly densities greater than 2,000 anomalies per acre, were completed using analog subsurface MEC removal prior to the MM2x2 investigation.

The subsurface removal work was completed in four phases to allow analysis of early intrusive investigation results to refine the classification process and thresholds prior to implementation of the classification survey and subsurface removal of the entire MEC removal area:

1. Analog subsurface removal in the two higher density fuel break grids, OR066 and NR151.
    - November 2018
2. Dynamic MM2x2 detection survey over the entire AGC removal area.
    - October 2018 to April 2019
3. MM2x2 classification and subsurface removal within a subset of the AGC fuel break grids, including Mercury Road grids ME007, ME010, and ME020.
    - Cued survey November 2018 to November 2019
    - Intrusive investigations in test grids December 2018 to January 2019
4. MM2x2 classification and subsurface removal in the remainder of the recommended AGC fuel break grids.
    - April 2019 to January 2020; and
    - September 2023 to November 2023

The dynamic detection survey was used to select the three Mercury Road fuel break grids for the initial subset classification survey. The subset classification survey included cued data acquisition, classification analysis, and intrusive investigation of 437 anomalies. 110 of the 437 were classified as potential TOI for intrusive investigation, while the remaining 327 were classified as non-TOI but intrusively investigated as QC verification digs. After completion of the subset area subsurface removal, removal results were evaluated to verify the target detection and classification thresholds for the classification survey.

1.5 Project Personnel and Subcontractors

Personnel duties can be found in the MEC QAPP (KEMRON, 2016), and KEMRON's organization structure for the supplemental subsurface MEC removal are profiled in the AGCMR-QAPP Addendum (KEMRON, 2023). Key personnel in the performance of the supplemental subsurface removal in the portions of Orion Road and Watkins Gate Road included the following:

- Senior Unexploded Ordnance Supervisor: Brad Olson (KEMRON)
- Unexploded Ordnance QC Specialist: Bruce McClain (KEMRON)
- UXO Safety Officer: Chris Light (KEMRON)
- Project Manager: Steve Crane (KEMRON)
- Program Geophysicist: Andy Gascho (AECOM)
- Project Geophysicist: Tom Furuya (Acorn-NAEVA JV)
- Lead Data Processor: Alison Paski (Acorn-NAEVA JV)
- Program QC Geophysicist: Alex Kostera (AECOM)
- Project QC Geophysicist: Jon Guillard (Acorn-NAEVA JV)
- Site Specific Data Manager: Penny Johnson (Acorn-NAEVA JV)
- GIS Manager: Larry Carr (AECOM)

QA validation of geophysical operations was provided by USACE Project Geophysicist, Kyle Lindsay. QA munitions management and explosives operations was provided by USACE Ordnance and Explosives Safety Specialist, James Britt.

1.6 Health and Safety

Subsurface MEC removal work was performed in accordance with the *Final, Revision 4, BASEWIDE ACCIDENT PREVENTION PLAN Munitions and Explosives of Concern Removal and Soil Remediation Project, Former Fort Ord, California* (KEMRON, 2021b).

Additionally, this work was performed under the requirements outlined in the Department of Defense Explosives Safety Regulation, 6055.09, Edition 1 (DESR, 2019), Safety and Health Manual, EM385-1-1 (USACE, 2014), the Department of Defense Explosive Safety Board's Methodologies for Calculating Primary Fragment Characteristics Technical Paper 16, Revision 4 (DDESB, 2016), and the Minimum Qualifications for Personnel Conducting Munitions and Explosives of Concern-Related Activities, Technical Paper 18, Revision 1 (DDESB, 2020). Additional applicable guidance, regulations, and policies are provided in the MEC QAPP (KEMRON, 2016).

1.7 Report Organization

This TIP details the work completed as part of the supplemental subsurface MEC removal on Orion Road and Watkins Gate Road. Historical fieldwork is identified in the section heading with "(Previous Fieldwork)" for information purposes only.

- MEC Removal Activities
    - Blind Seed Item Placement (Previous Fieldwork)
    - Analog Subsurface Removal (Previous Fieldwork)
    - MM2x2 Assembly and Verification (Previous Fieldwork)
    - MM2x2 Dynamic Detection Survey (Previous Fieldwork)
    - MM2x2 Static Classification Survey (Previous Fieldwork)
    - MM2x2 Static Classification Data Analysis and Classification (Previous Fieldwork)
    - Intrusive Investigation and Subsurface Removal
- Results
- Quality Control
- Data Verification and Validation

1.8 Changes to Documentation

The Non-Burn SSWP (Shaw, 2010) detailed the scope and site-specific procedures for the MEC RA within the network of the Impact Area MRA Fuel Break System. The FWVs for the Non-Burn SSWP (Shaw, 2010) are briefly summarized in this section.

- TII-045 (Shaw, 2011): Modified portions of the permanent fuel break system originally included in the Non-Burn SSWP (Shaw, 2010).
- 03-002 (Innovative Technical Solutions, Inc, 2011): Clarified steps to be taken during subsurface MEC remediation with regard to 1) DGM anomaly density in fuel breaks, 2) Data gaps in DGM, 3) Special Case Areas (from Parsons work), and 4) QC in fuel breaks.
- 03-021 (Gilbane, 2015): Removed Evolution Road north of Broadway Avenue from the fuel break network.
- 001 (KEMRON, 2015a): Added Hugo Road to the fuel break network.
- 004 (KEMRON, 2016a): Incorporated realignment of Nowhere Road as part of the fuel break network.
- 013 (KEMRON, 2018a): Incorporated realignment of Evolution Road as part of the fuel break network.
- 014 (KEMRON, 2018b): Incorporated portions of Impossible Canyon Road, and a realignment of a section of Impossible Canyon Road to mitigate erosion concerns, as part of the fuel break network.
- 015 (KEMRON, 2018c): Removed Steep Road from the fuel break network.
- 017 (KEMRON, 2018d): Supplemental QC investigation results indicated that the portions of the Impact Area MRA fuel break system where MEC and MEC-like MD items were most likely to remain correlated to the parts of the Impact Area MRA where 81mm mortars were previously recovered and where the pre-subsurface removal anomaly density was highest. Additional subsurface removal was recommended in 25.5 acres of the Impact

Area MRA fuel break system to address the possibility of MEC items remaining in these areas. The assessment of those segments is complete, and selected anomalies remaining to be intrusively investigated are identified in *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

KEMRON completed the AGCMR-QAPP Addendum (KEMRON, 2023) in September 2023 to bring AGC investigations at Fort Ord into compliance with DoD's DAGCAP requirements. DoD developed AGC to improve the efficiency of cleaning up munitions and to focus its resources on addressing potential explosives safety risks at munitions response sites. To ensure quality data, the Office of the Deputy Assistant Secretary of Defense for Environment, Safety and Occupational Health created DAGCAP to accredit organizations for AGC work awarded in calendar year 2017 and after. Accreditation through the DAGCAP is achieved through a two-step process: 1.) accessing the organization's quality system, and 2) successfully demonstrating capabilities performed at the Aberdeen Proving Ground DAGCAP test site or through a virtual demonstration of capabilities. DAGCAP uses third-party accreditation bodies to provide a unified program for organizations to demonstrate competency and document conformance to requirements. The requirements are based on the international standard ISO/IEC 17025:2017, supplemented by the DoD Quality Systems Requirements for Organizations Performing Advanced Geophysical Classification. The scope of accreditation is as follows: ISO 17025:2017, General Requirements for the Competence of Testing and Calibration laboratories, accreditation for Technology (Electro Magnetic Induction), Test (Subsurface Munitions), and Method (Advanced Geophysical Accreditation). The Environmental Data Quality Workgroup provides management and oversight of the DAGCAP. AGC work at the Former Fort Ord was conducted prior to the requirement for DAGCAP accreditation.

During the 2023 fieldwork, no changes were required to the *Site Specific Work Plan Fuel Breaks Supplemental Subsurface Munitions and Explosives of Concern Removal, Impact Area Munitions Response Area Former Fort Ord, California Orion Road and Watkins Gate Road* (KEMRON, 2023a).

2.0 Supplemental Subsurface MEC Removal Activities

Historical fieldwork is documented in the *DRAFT FINAL Volume 1, Technical Information Paper Fuel Breaks Impact Area, Former Fort Ord, California* (KEMRON, 2021) and *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

2.1 Blind Seed Item Placement (Previous Fieldwork)

Prior to the AGC of the supplemental MEC removal, QC seed items were placed in random locations in the subsurface throughout the subsurface removal area to verify the quality of subsurface MEC removal activities, including analog removal, MM2x2 data acquisition, processing and analysis, and intrusive investigation. QC seed item locations were camouflaged with dirt or vegetation to hide ground disturbance, and no QC seed items were placed in paved areas. QC seed items consisted of small schedule-80 industry standard objects (ISO). 78 QC seed items were buried 6 inches below ground surface. Seed items were emplaced by the QC Geophysicist and a UXO Technician II utilizing a real time kinematic (RTK) global positioning system (GPS) receiver to measure location information for each seed item, and precise burial information was recorded. To maintain the integrity of the QC program, seed item burial information was not provided to personnel involved in data acquisition, processing, or intrusive investigation activities until those activities were completed. 30 of the QC seed items were placed on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). Details of the blind seeding burial information is documented in the *Quality Control Seeding Report - Supplemental Subsurface MEC Removal, Impact Area Munitions Response Area, Permanent Fuel Breaks, Former Fort Ord, California,* which is included as Appendix A.

During previous fieldwork, additional QA validation seed items were emplaced by the USACE Project Geophysicist. QA validation seed item information was not provided to the subsurface MEC removal team until data acquisition, processing, and intrusive investigation activities were completed.

Based on the subsurface MEC removal operations in the supplemental area, 78 QC seed items were initially buried, with 30 specifically located in the Orion Road and Watkins Gate Road grids. During the recent subsurface removal operations, all 30 QC seed items were successfully recovered. Regarding the remaining 48 QC seed items from the supplemental area, one was removed after dynamic detection survey but before the static classification survey, and 47 were recovered during subsurface removal operations conducted between 2018 and 2020. In summary, all QC seed items have been accounted for and recovered, signifying that all QC issues related to seed item recovery have been fully resolved. This demonstrates the overall effectiveness of the QC Seeding Program in ensuring thorough subsurface MEC removal.

2.2 Analog Subsurface Removal

In 2018, analog subsurface MEC removal utilizing handheld metal detectors was completed, in accordance with the MEC QAPP (KEMRON, 2016), prior to MM2x2 AGC DGM in two grids, Orion Road grid OR066 and Nowhere Road grid NR151, where the EM61-MK2 DGM data indicated high subsurface anomaly density (greater than 2000 anomalies per acre). This work was completed between November 8, 2018 and November 20, 2018 and included 925 individual investigations. 126 pounds of MD were recovered, along with 2 QC seeds (not included in the 78 QC seeds emplaced for the AGC survey as discussed in Section 2.1) and 1 QA validation seed. No MEC items

were recovered in the analog subsurface MEC removal.

In 2023, the data gaps in the dynamic AGC detection survey were investigated utilizing a single EM61-MK2A unit in analog mode. The UXO team employed a Leica GPS to locate the known positions and handheld analog metal detectors in accordance with the *MEC QAPP* (KEMRON, 2016) to perform the analog subsurface removal. The team documented each data gap area in accordance with Section 8 of the MEC QAPP (KEMRON, 2016) UXO Standard Operating Procedure (SOP) 3. Figure 4 includes the completed data gap areas located on Orion Road north of Hawkeye Road (grids OR086-OR135) and Watkins Gate Road (grids WG146-WG186). The results of the 2023 analog subsurface removal are described in Section 3.3.2.

2.3 MetalMapper 2x2 Assembly and Verification (Previous Fieldwork)

Prior to MM2x2 data acquisition, instrument assembly and performance were verified through instrument function tests and an instrument verification strip (IVS) survey. The IVS utilized for the initial IVS surveys was located at Unit 4 in the Impact Area MRA and had been previously constructed by the QC Geophysicist and a UXO Technician II, in accordance with the specifications provided in the *AGCMR-QAPP* (KEMRON, 2016b), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e).

2.3.1 MetalMapper 2x2 Assembly (Previous Fieldwork)

The MM2x2 system was assembled in accordance with standard operating procedure AGCMR-01 (Appendix B of the AGCMR-QAPP (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e)) on October 22, 2018. Assembly of the system included mounting the coil assembly, wheels, RTK GPS and inertial measurement unit (IMU) on the survey sled and connecting and routing all cables to the data acquisition computer. Assembly of the MM2x2 system included verification of the orientation of the transmit coils, the orientation of the IMU, operation of the RTK GPS, and correct input of the data acquisition parameters.

2.3.2 Initial Instrument Function Tests (Previous Fieldwork)

On October 22, 2018, initial system operation was verified by acquiring a system function test utilizing a small schedule 80 ISO (ISO-80), as described in SOP AGCMR-01 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e). Transmit current levels were monitored in addition to verification of correct modeled location and library match of the ISO-80 test object. System assembly and verification were completed by the data acquisition geophysicist and overseen by the Project Geophysicist.

After completion of the instrument tests, initial dynamic and static IVS surveys were performed at the Unit 4 AGC IVS, also on October 22, 2018, as described in SOP AGCMR-02 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e).

The IVS consisted of 2 small ISO-80s and 1 blank location. One small ISO-80 was buried vertically,

15 centimeters (cm) below ground surface (to the center of mass of the ISO), and the second small ISO-80 was buried horizontally, 10cm below ground surface (to the center of mass of the ISO). The IVS location and layout are shown in the IVS Memorandum which is provided in Appendix B of the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

2.4 MetalMapper 2x2 Dynamic Detection Survey (Previous Fieldwork)

The MM2x2 dynamic detection survey of the 25.5-acre supplemental subsurface MEC removal area included data acquisition and data processing and analysis tasks and culminated in the creation of a list of anomalies (for further static classification survey) potentially representing subsurface TOI. Details of the detection survey data acquisition, processing, and analysis approaches are presented in SOPs AGCMR-05 and AGCMR-06 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e). Measurement quality objectives (MQO) associated with the MM2x2 dynamic detection survey are presented in Worksheet 22 of the *AGCMR-QAPP* (KEMRON, 2016b), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e).

2.4.1 Dynamic Detection Data Acquisition (Previous Fieldwork)

MM2x2 dynamic detection data acquisition was conducted between October 22, 2018 and April 16, 2019 by a data acquisition team comprised of 2 NAEVA geophysicists. Data acquisition was completed in accordance with SOP AGCMR-05 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e), including verification of successful attainment of MQO. Gaps in the dynamic detection survey due to terrain or vegetation were surveyed by a team of UXO Technicians utilizing handheld analog metal detectors in accordance with the MEC QAPP (KEMRON, 2016).

Section 3.3.2 includes the analog data gap investigation results for the portions of Orion Road and Watkins Gate Road completed in 2023.

2.4.2 Dynamic Detection Data Processing and Analysis (Previous Fieldwork)

Processing and analysis of the detection survey data, including target selection and verification of successful attainment of MQO, were accomplished by NAEVA data processors using Geosoft's Oasis Montaj UX-Analyze Advanced (UXA) software, in accordance with SOP AGCMR-06 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e). The summed monostatic Z-component measurements in the detection survey data were processed and analyzed to identify anomalies meeting the minimum response amplitude criteria of potential TOI (2.5 millivolts/amp), which were based on the initial IVS survey results and the test pit response of an inert 37mm projectile at 16 inches below ground surface.

The MM2x2 dynamic detection survey resulted in the identification of 23,023 anomalies as

potential TOI, each of which was assigned a unique identification number for the follow-on static classification survey. Detection survey results occurred during previous fieldwork and are discussed in Section 3.1. The subsurface anomaly locations selected from the dynamic detection data are displayed on Figure 4 in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

2.5 MetalMapper 2x2 Static Classification Survey (Previous Fieldwork)

The static MM2x2 classification survey of the 23,023 subsurface anomalies identified for classification analysis included data acquisition and data processing, analysis, and classification tasks and culminated in the creation of a list of targets ranked by their likelihood of being a TOI. The ranked target list was divided into targets for intrusive investigation and removal and targets which could be left in place. Details of the classification survey data acquisition, processing, and analysis approaches are presented in SOPs AGCMR-07 and AGCMR-08 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e). MQO associated with the MM2x2 static classification survey are presented in Worksheet 22 of the *AGCMR-QAPP* (KEMRON, 2016b), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e).

2.5.1 MetalMapper 2x2 Static Classification Data Acquisition (Previous Fieldwork)

MM2x2 static classification data acquisition was conducted between November 13, 2018 and November 26, 2019, in accordance with SOP AGCMR-07 (Appendix B of the (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e).

Static function test measurements and IVS surveys were completed at the beginning and end of each day during the MM2x2 survey. Static data acquisition for target classification involved positioning the MM2x2 sensor over each anomaly selected from the MM2x2 dynamic detection survey and acquiring static measurements. Data acquisition procedures included the following steps, which are described in detail in SOP AGCMR-07 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e)):

1. **Background measurement acquisition.** Static MM2x2 data was acquired at previously-identified background locations, where no metallic interference exists. Background measurements record the non-target system response, which includes responses from the ambient environment, soil and geologic features, and the MM2x2 system itself. During data processing, the background signal was removed from target anomaly measurements, leaving only the response from the unknown metallic anomaly source. Background measurements were collected at a minimum of every hour during data acquisition activities to provide background signatures representative of changing target locations and environmental conditions.
2. **Navigation to the anomaly location**. Anomaly locations were loaded into the MM2x2 data acquisition computer prior to data acquisition operations to allow navigation to each anomaly through the use of the MM2x2 RTK GPS positioning system. Although the MM2x2 has the ability to direct the data acquisition geophysicist to an anomaly location

based upon the geophysical signal received, the first measurement was always acquired at the provided detection anomaly location. After navigation to the anomaly location, the center of the sensor was precisely positioned (within 2 inches) over the provided anomaly location.

3. **Static sensor measurement acquisition**. The static measurement acquisition process was initiated, taking care that the sensor remained stationary during the measurement and was isolated from all external sources of electromagnetic signals. Any metal associated with the sensor and deployment platform (e.g., console, support structures) that could not be reasonably distanced from the sensor was kept in the same physical location with respect to the sensor as during background measurements.
4. **Acquired data integrity and quality verification.** Immediately after data acquisition, the integrity and quality of the data were verified by the data acquisition geophysicist by inspection of the MM2x2 data acquisition display to verify the following:

    - The data acquisition cycle completed properly
    - The transmit current for each transmitter was within an acceptable range (≥ 5.5 amps)
    - The decay curves measured by each receiver coil appeared reasonable and were not flat-lined or over-saturated
    - GPS and IMU information were recorded

The additional step of performing a field inversion to verify that the acquired data measurement was centered over the anomaly source, which is described in SOP AGCMR-07 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e), was not conducted as part of the data acquisition process because this function was not available in the MM2x2 acquisition software at the time. The inversion was therefore performed by the data processor to verify that each measurement met the measurement performance criteria.

2.5.2 Classification Library Creation (Previous Fieldwork)

The existing Department of Defense classification library data derived from previous Environmental Security Technology Certification Program and Military Munitions Response Program projects and included with UXA was used to establish the site-specific classification library for the supplemental subsurface MEC removal. The site-specific library used for classification for this activity was created by augmenting the existing classification library with test pit measurements of an 8-inch projectile conducted in the Badger Flats area of Unit 12, as described in the *Unit 23 Risk Reduction Technical Memorandum, Former Fort Ord, California* (KEMRON, 2020). The final site-specific classification library included signatures for all expected subsurface MEC removal TOI, including QC and QA validation seed items.

2.5.3 Data Analysis and Classification (Previous Fieldwork)

Static data processing and classification analysis were completed by NAEVA data analysts in accordance with SOP AGCMR-08 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e). Data processing included isolation and

removal of background responses from the MM2x2 data measurements and application of the inversion algorithms in the UXA extension of Geosoft Oasis Montaj to model the intrinsic features of each anomaly source. The modeled features, in the form of primary, secondary, and tertiary polarizability curves (which represent the three-dimensional structure of the item), were used to classify each anomaly as a TOI (likely to be a MEC item) or a non-TOI (highly-likely to be something other than a TOI). Classification was accomplished primarily through matching each target's polarizability curves to the site-specific library of TOI signatures, with additional consideration given to cluster and feature space analysis. Targets classified as TOI (and those for which the acquired MM2x2 data did not support a confident classification decision) were selected for reacquisition and subsurface removal. Targets classified as non-TOI were left in place.

After applying background corrections, the data was modeled to estimate the features of each target anomaly using the UXA process data interface. The modeled features for each anomaly include extrinsic parameters (location and orientation) as well as the intrinsic parameters related to the object size, symmetry and composition. The target feature estimation process was accomplished through inversion modeling of the static MM2x2 data. Inversion modeling involves proposing and testing multiple combinations of potential targets and locations to determine which combinations produce a result most like the measured data for each anomaly. Both single-source and multiple-source inversion routines were run to determine the parameters of each anomaly source (single-source inversion), or of each group of anomaly sources (multiple-source inversion), that would produce a response similar to the measured response at each anomaly location. The modeled intrinsic parameters are visualized as three principal axis polarizabilities, also known as betas (β), which describe the Electromagnetic Induction (EMI) response of each target along the three principal axes of the item. The combination of principal axis polarizabilities is unique to an item and is therefore used for classification by comparing the polarizabilities to a library of representative munitions item polarizabilities. Size and decay parameters of each anomaly at specific timegates ranging from 25 microseconds to 24.375 milliseconds were also calculated, in accordance with SOP AGCMR-08 (Appendix B of the (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e).

The single-source inversion solves for a single target as the anomaly source, while the multiple-source inversion assumes that the measured response is the result of multiple anomaly sources. The multiple-source solver not only presupposes multiple sources contributing to a measured anomaly response but also produces several potential combinations of anomaly sources. Each potential combination proposes a configuration of targets whose modeled response reasonably fits the measured data. For any given target, one potential combination may have three anomaly sources, while a second potential combination for the same measurement may have two or four anomaly sources. This process reflects the fact that, with an unknown number of potential targets of different sizes and shapes, several different models can closely match the measured data. A separate fit coherence value, which measures the degree of fit to the measured data, is derived for each multiple-source potential combination as well as for the single-source model.

Model results were used for classification only if they met the MQO in Worksheet 22 of the *AGCMR-QAPP* (KEMRON, 2016b), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e),

verifying that they are of sufficient quality to support classification.

2.5.4 Daily Instrument Verification Strip (Previous Fieldwork)

At the beginning and at the end of each day of data acquisition, static measurements were acquired at each IVS target location, as described in SOP AGCMR-02 (Appendix B of the *AGCMR-QAPP* (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e). The IVS measurements were processed as described above, and the derived features were assessed against the MQO presented in Worksheet 22 of the *AGCMR-QAPP* (KEMRON, 2016b), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e).

2.5.5 Data Verification (Previous Fieldwork)

Data verification was conducted each day of data acquisition to demonstrate the achievement of project MQO. Prior to importing MM2x2 data into the UXA module within Geosoft's Oasis Montaj geophysical processing environment, the data processor specified general settings in UXA to define the data acquisition parameters for the survey, including settings such as survey mode (static or dynamic), database names, and distance units. After initial setup of the UXA project, the data processor imported data into the following four separate databases:

- Static background measurement data
- Background features
- Static anomaly measurement data
- Target features

The target features database initially contained the locations of each surveyed anomaly but was subsequently populated with summaries of the derived feature and classification information for each target. The background features database initially contained the locations of each background measurement but was subsequently populated with statistics and QC check values. After importing the static data, the data processor verified the quality of the measurements against the MQO provided in Worksheet 22 of the *AGCMR-QAPP* (KEMRON, 2016b), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e), for the following characteristics:

- Transmit (Tx) current within limits
- GPS fix quality
- Valid IMU data
- EMI response signal not saturated
- Offset of acquisition location from flag/anomaly list location

A preliminary library match using the single-source modeled parameters was performed as part of data verification to assist in determining the usability of the data and to verify that static classification survey MQO have been satisfied.

Graphic decision plots displaying a summary of measured and modeled data associated with each static measurement were evaluated along with the targets feature database for the following:

- Tx current

- Valid GPS fix
- Valid IMU reading (or correctable based on field notes)
- Offset from flag within MQO
- Acceptable fit error
- Fit coherence within MQO
- Reasonable size and decay
- Successful library match

2.5.6 Initial Classification (Previous Fieldwork)

Classification of targets was based upon objective and quantitative criteria. Using these criteria, a prioritized list was created with high-likelihood TOI placed at the top of the list (just after digs classified as cannot analyze) and high likelihood non-TOI placed at the bottom of the list. Cannot analyze targets are those for which the measured data could not support a confident classification decision. Because these targets could not be confidently identified as non-TOI, they were excavated. The primary method for classification was library matching, supplemented by cluster analysis and feature space analysis.

2.5.6.1 Library Matching (Previous Fieldwork)

Classification was based primarily on the fit metric (values from 0.0 to 1.0, with 1.0 representing a perfect match) generated by UXA during a comparison of the β values estimated for each surveyed target and the β values of the TOI items in the classification library. The comparison was performed via the library match utility in UXA. The fit metric is a measure of the fit correlation between a target and the library entry that best fits that target, with higher values indicating a better fit between the target and the corresponding item in the library. The library fit analysis matches the following four combinations of βs to those of the candidate library TOI:

1. β1, β1/β2, β1/β3
2. β1, β1/β2
3. β1/β2, β1/β3
4. β1

The confidence metrics for each fit combination were averaged to derive a decision metric.

Both single-source and multiple-source models were used during the inversion process for each flagged location. The results of all the models were compared against the library signatures, and the most conservative result, or the result most similar to a TOI, was saved. Once completed, the targets were ranked, or ordered, from TOI to non-TOI according to their library-match comparison values. Library-match comparison values below the project decision metric threshold were considered non-TOI.

2.5.6.2 Cluster Analysis and Feature Space Analysis (Previous Fieldwork)

Cluster analyses were performed using the UXA scatter analysis utility to identify clusters of anomalies with similar β signatures not in the classification library. Due to the comprehensive

site-specific list of TOI for the subsurface removal, cluster analysis was expected to be unnecessary, and it was anticipated that all TOI were already identified with signatures in the library. Cluster analysis, however, was performed to provide additional confidence in the subsurface removal. The same library matching method described above was used, but instead of using the known TOI signature library, a "self-match" of each measured anomaly was performed. Static measurements with high cluster threshold confidence metrics were identified and reviewed along with a size-decay feature space plot to determine if they were related to a grouping of unique signatures potentially representing a TOI not contained in the initial classification library. For each identified cluster, the data processor selected a representative sample to be intrusively investigated. If the intrusive investigation identified a potentially hazardous item that should be on the TOI list, a representative signature would have been placed in the site-specific library, and the library matching process would have been repeated to ensure that all items with similar β signatures were classified as TOI. No additional TOI requiring placement in the munitions library were identified.

Individual items not matching any library items but having β signatures indicating large, axially-symmetric, thick-walled objects were also identified and investigated as part of the calibration data and would have been added to the library if they were determined to be TOI. No additional TOI requiring placement in the munitions library were identified.

2.5.7 Classification Thresholds (Previous Fieldwork)

Classification threshold values were derived from previous AGC work at the former Fort Ord and evaluated throughout the work by comparing intrusive investigation results to modeled anomaly source predictions. Classification expressions utilized during classification analysis contained the logic for sorting the ranked target list and included the following categories:

- Category 0 (Cannot Analyze)
- Category 1 (High-Confidence TOI)
- Category 2 (Low-Confidence TOI)
- Category 3 (High-Confidence Non-TOI)

Category 0 (Cannot Analyze) anomalies included measurements where the inversion process failed, reliable polarizabilities could not be extracted from the data, modeled depths were unreasonable, or fit coherence was poor. Category 1 anomalies were those highly-likely to be TOI. Category 2 (Low-Confidence TOI) anomalies consisted of measurements not obviously TOI but with enough TOI characteristics that they could not be confidently classified as non-TOI. Category 3 anomalies were those highly-likely to be non-TOI. The following library match metric thresholds, also referred to as decision statistics, were used as the initial criteria to classify and rank the anomalies:

- Category 1 (High-Confidence TOI) Decision Statistic Threshold > 0.97
- Category 1 (High Confidence TOI) Decision Statistic Lower Boundary > 0.95
- Category 2 (Low-Confidence TOI) Decision Statistic Threshold > 0.92
- Category 2 (Low-Confidence TOI) Decision Lower Boundary > 0.825
- Category 2 (Low-Confidence TOI, Low Signal) Decision Statistic Threshold > 0.92

- Category 2 (Low-Confidence TOI, Low Signal) Decision Statistic Lower Boundary > 0.75
- Category 0 (Cannot Analyze)
    - Poor Fit Coherence < 0.800
    - Unreasonable depth > 2 meters
    - High Chi-square value > 8000

The selection thresholds utilized were (a) the industry standard values (or within an acceptable range of that value based on site conditions), (b) set low enough to expect all TOI to be recovered based on validation digs and QC checks, (c) set at values that reduce the number of unnecessary digs, and (d) tailored to the signal to noise ratio of the collected data, so that lower signal targets were classified more conservatively. In some cases, the data analyst manually overrode the thresholds and moved anomalies to other classification categories after analysis of the data.

2.5.8 Final Classification (Previous Fieldwork)

After each grouping of static MM2x2 data were acquired and analyzed, a preliminary ranked list containing all measured anomalies was delivered to the QC Geophysicist to verify that relevant MQO (including QC seed classification) were met, and a final review of the ranked list was performed to generate a ranked target list. The ranked target list for Orion and Watkins Gate Roads is included in Appendix C. Every target measured in the static classification survey was included on the prioritized list, classified as TOI, non-TOI, or cannot analyze, and sorted based on its likelihood to be a TOI. All targets in the cannot analyze and TOI categories were selected for intrusive investigation. Intrusive investigation locations, including classification categories, are shown on Figure 5 in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

2.5.8.1 Root Cause Analysis and Corrective Action (Previous Fieldwork)

Root cause analysis and corrective action for a misclassified validation seed is documented in Appendix E of the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

On January 16, 2020, the KEMRON geophysical team was informed that QA validation seed QAS 009, a schedule 80 small ISO, was misclassified as a non-TOI, resulting in a failure of the "classification performance" MQO in AGCMR-QAPP (KEMRON, 2016b). Through review of the data associated with this seed item, it was determined that the small ISO was located slightly within a data gap on the west shoulder of Orion Road in the southern half of Grid OR069. However, dynamic MM2x2 data were collected close enough to the item that it was detected within the "dynamic detection performance" MQO.

The root cause of the QA failure was determined to be analyst error in not following the standard procedure for including the original cued target measurement (if of sufficient data quality) along

with the redo target measurement in the final classification analysis. To prevent future recurrence of this issue, an additional check will be added to the data processing and analysis routine for the data analyst to verify that appropriate cued target measurements of sufficient quality for classification analysis, both original and redo, are considered when making the final classification decision. As described in Section 5.2, no additional root cause analysis and corrective action was required during the 2023 fieldwork.

2.6 Intrusive Investigation

Due to the end of the KEMRON task order in 2020, subsurface removal was completed in two phases. Of the 23,023 dynamic detection targets identified for static MM2x2 measurement, 6,673 were located in Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186) and 16,350 were located in other areas of the Impact Area Fuel Break System. In 2020, all grids within the Impact Area Fuel Break System were completed except for grids OR086-OR135 and WG146-WG186. Historical supplemental MEC removal fieldwork is documented in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

The intrusive investigation for the supplemental subsurface MEC removal on Orion Road and Watkins Gate Road in the Impact Area MRA permanent fuel break system occurred from September 18, 2023 through November 21, 2023. Below is a summary fieldwork activities performed in accordance with the *Site Specific Work Plan Fuel Breaks Supplemental Subsurface Munitions and Explosives of Concern Removal, Impact Area Munitions Response Area Former Fort Ord, California Orion Road and Watkins Gate Road* (KEMRON, 2023a):

- Target Digs
  Orion Road: 9/18/2023 – 10/30/2023
  Watkins Gate Road: 9/18/2023 – 10/02/2023

- Data Gaps
  Orion Road: 10/31/2023 – 11/17/2023
  Watkins Gate Road: 10/31/2023 – 11/17/2023

- Validation and Verification Digs
  Orion Road: 11/14/2023 – 11/21/2023
  Watkins Gate Road: 11/14/2023 – 11/17/2023

As described in Section 3.2, 5,130 anomalies, approximately 77% of the 6,673 targets measured within grids OR086-OR135 and WG146-WG186 grids, were classified as high-confidence non-TOI during the static classification survey and determined to be acceptable to leave in place. The remaining 1,543 anomalies, including those classified as high-confidence TOI, those that could not be analyzed, and those for which a confident non-TOI classification could not be made, were identified for intrusive investigation and removal.

Appendix B, Geophysical Classification Verification and Validation Plan, describes procedures for verifying and validating the classification results of the fuel breaks supplemental subsurface MEC removal on Orion Road and Watkins Gate Road. As discussed in Appendix B, to adequately verify the library match thresholds and conform with the DAGCAP requirements, the next 200 targets with library match decision metrics below the final TOI recovered from the ranked dig list should be intrusively investigated. The lowest-ranked target that resulted in the recovery of a TOI was target OR109_132008_001_11, which had a decision statistic of 0.9281. 118 Category 2 targets were ranked lower on the dig list and were intrusively investigated during normal production activities. Therefore, 82 additional digs were required to meet the requirement of 200 total digs after the last TOI. No TOI were recovered from the 200 intrusive investigations after the last TOI, and the library match threshold was therefore successfully verified.

Appendix C includes the Orion Road and Watkins Gate Road intrusive investigation results. All intrusive operations were performed in general accordance with the *MEC QAPP Addendum* (KEMRON, 2023) and the *MEC QAPP* (KEMRON, 2016a), with AGC-specific details in accordance with SOP AGCMR-09 (Appendix B of the AGCMR-QAPP [KEMRON, 2016b]), as modified for MM2x2 by *FWV 012* (KEMRON, 2018c).

2.6.1 Reacquisition of Anomalies Selected for Intrusive Investigation

Anomalies selected for intrusive investigation were reacquired by the UXO team that performed the investigation using RTK GPS to place a flag at the modeled target location derived through the data processing and classification process in accordance with SOP AGCMR-07 (Appendix B of the AGCMR-QAPP (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e) and SOP AGCMR-09 (Appendix B of the AGCMR-QAPP (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e), and ANJV SOP 9, ANJV SOP 10, and ANJV SOP 13 SOP of the AGCMR-QAPP Addendum (KEMRON, 2023). The anomaly ID was written in an indelible marker on a survey flag placed at the anomaly location.

2.6.2 Intrusive Investigation and Removal of Anomaly Sources

Specific intrusive investigation procedures, including vertical and lateral excavation limits, are detailed in MEC QAPP (KEMRON, 2016), SOP AGCMR-09 (Appendix B of the AGCMR-QAPP (KEMRON, 2016b)), as modified for MM2x2 by *FWV 012* (KEMRON, 2018e), and ANJV SOP 9, ANJV SOP 10, and ANJV SOP 13 SOP of the AGCMR-QAPP Addendum (KEMRON, 2023). Due to the precision of AGC data and modeling results, as well as to the nature of classification surveys, where non-TOI metallic items are purposely left in the ground, intrusive investigations were conducted with different procedures than those of intrusive investigations based on standard DGM. Each excavation was conducted only in the immediate vicinity of the reacquired target location, with an approximate 10-inch search radius. The investigation proceeded until the predicted item (or a metallic item of comparable size and shape) was recovered or until the excavation depth reached 12 inches below the predicted depth. For anomalies with no modeled source item and reliable predicted depth, such as Category 0 (cannot analyze) and Category 3 (high-confidence non-TOI investigated for verification and validation purposes), intrusive

investigation followed standard non-AGC procedures, as described in UXO SOP 4 (Appendix B of the MEC QAPP (KEMRON, 2016)), and proceeded until inspection with a handheld metal detector indicated that no anomaly source remained.

Post-investigation anomaly resolution was verified by comparing the modeled classification results (recovery position, size, and depth) to the actual intrusive investigation results. All intrusive investigation results passed the intrusive survey MQOs as defined in Worksheet 22 of the AGCMR-QAPP Addendum (KEMRON, 2023), or a justification was provided for the source of the mismatch.

3.0 Results

Section 3.0 presents the results of the technical scope which includes subsurface MEC removal, associated QC, and reporting on Watkins Gate Road and Orion Road. Supplemental subsurface MEC removal activities completed through 2020 are documented in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

In 2023, the 1,543 potential TOIs on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186) were intrusively investigated and removed in accordance with the MEC QAPP (KEMRON, 2016a) and AGC specific details in accordance with SOP AGCMR-09 [Appendix B of the AGCMR-QAPP Addendum (KEMRON, 2023)].

UXO Teams intrusively investigated reacquired anomalies using procedures described in UXO SOP 4 and SOP AGCMR-09. Verification of intrusive anomaly investigation results is detailed in GEO SOP 8 and the AGCMR-QAPP Addendum (KEMRON, 2023). Each recovered MPPEH item was tracked by item type, description, weight, and recovery depth (to the top of the item). A digital photograph was taken of each recovered item, and the location of MPPEH was acquired with a GPS to document the geo-referenced location at which it was found. The general type of MD items encountered per investigation location were documented.

If no target was contacted during the intrusive investigation, then the investigation terminated at a depth of 12 inches below the predicted depth of the anomaly source. For each excavated target, soil was stockpiled separately to allow for replacement that mirrors preexisting conditions after operations were complete, to the extent feasible. Each excavated target was backfilled with stockpiled soil after the target anomaly was resolved.

The data gaps in the dynamic AGC detection survey, shown in Figure 4, were investigated utilizing a single EM61-MK2A unit in analog mode. The UXO team utilized a Leica GPS to locate the known positions and handheld analog metal detectors in accordance with the MEC QAPP (KEMRON, 2016) to perform the analog subsurface removal. The analog investigation did not result in any incomplete area or unresolved anomalies.

3.1 Detection Survey Results (Previous Fieldwork)

The MM2x2 dynamic detection survey was completed prior to the 2023 fieldwork on Orion Road and Watkins Gate Road. During previous fieldwork, the MM2x2 dynamic detection survey resulted in the identification of 6,673 subsurface anomalies for investigation in the static MM2x2 classification survey on Orion Road and Watkins Gate Road. The targets selected for the static classification survey are displayed on Figure 4 and listed in Appendix C of the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

Gaps in the dynamic AGC detection survey due to terrain or vegetation occurred in 40 grids on Orion Road and 26 grids on Watkins Gate Road, and these were investigated from October 31, 2023, through November 17, 2023. Figure 4 displays the completed AGC data gap locations. Section 3.3.2 provides the results of the analog data gap investigation.

3.2 Classification Results (Previous Fieldwork)

Prior to the 2023 fieldwork, a MM2x2 investigation included a dynamic detection survey in which 23,023 subsurface anomalies were identified for investigation in the follow-on static MM2x2 classification survey. Of the 23,023 dynamic detection targets identified for static MM2x2 measurement, 6,673 were located in Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186) and 16,350 were located in other areas of the Impact Area Fuel Break System. A subsequent analysis was performed of the data, and inaccessible targets were renamed as designated to Category 0 for intrusive investigation. In 2020, all grids within the Impact Area Fuel Break System were completed except for grids OR086-OR135 and WG146-WG186. Table 2 summarizes the results of the dynamic detection survey. Appendix C includes the ranked target list for Orion Road and Watkins Gate Road.

Table 2. Classification Category Summary

Classification Category	2020 Completed Subsurface Removal Targets	2023 Completed Subsurface Removal Targets	Total
Category 0 (Cannot Analyze)	6,649	294	6,943
Category 1 (High-Confidence TOI)	260	117	377
Category 2 (Low-Confidence TOI)	2,964	1,132	4,096
Category 3 (High-Confidence Non-TOI)	6,477	5,130	11,607
TOTAL	16,350	6,673	23,023

3.3 Subsurface Removal Results

Intrusive investigation and subsurface removal results in the supplemental subsurface removal completed in Orion Road and Watkins Gate Road indicate that 69% of TOI were recovered from

the Category 1 (High-Confidence TOI) anomalies, and 31% of TOI were recovered from Category 2 (Low-Confidence TOI) anomalies, with good correlation between modeled data sources and intrusive results. Appendix C includes the Orion Road and Watkins Gate Road intrusive investigation results. Table 3 presents a summary of the Orion Road and Watkins Gate Road subsurface MEC removal.

Table 3. Orion Road and Watkins Gate Road Subsurface MEC Removal Summary

Unit/Operation	Targets	Acreage	Lbs MD	Lbs OD	MEC Items[1]	QC Seeds	QA Seeds
FB QC Digs - Orion Rd Fuel Break (OR)	1,220	5.29	778.00	62.00	5	17	36
QC FB Digs - Watkins Gate Rd Fuel Break (WG)	323	3.99	237.45	64.85	3	13	30
QC FB Validation/Verification Digs - Orion Rd Fuel Break (OR)	214	N/A	100.50	1.25	0	0	0
QC FB Validation/Verification Digs - Watkins Gate Rd Fuel Break (WG)	68	N/A	28.25	11.75	0	0	0
Total	1,825	9.28	1,144.20	139.85	8[1]	30	66

[1] Three (3) additional MEC items were recovered from the analog data gap investigations performed from October 31, 2023, through November 17, 2023. See Table 5 to review the analog data gap investigation summary.

3.3.1 Recovered Targets of Interest

The 1,543 anomalies classified as Category 0, Category 1, and Category 2 on Orion Road (grids OR086-OR135) and Watkins Gate Road (grids WG146-WG186) were intrusively investigated, resulting in 118 anomaly targets resulting in the recovery of 110 TOI items (Table 4).

In some instances, multiple targets were associated with the same subsurface object. The initial classification list included eight targets that indicated potential 81mm mortar projectiles. Intrusive investigations of the eight targets resulted in recovery of four 81 mm projectiles (three MEC items and 1 MD item). The recovered TOI includes six TOI that resulted in four MD items and assorted MD components. Subsurface removal results are summarized in Table 4, and final

status of the recovered MPPEH is displayed in Figure 5. In addition, Figure 6 presents the recovered MD by weight, and Figure 7 includes the QC seed locations.

Table 4. Recovered Targets of Interest Summary

Item	Targets Investigated[1]	Quantity Recovered	Subsurface Objects Correctly Classified as Potential TOI	Cat 1	Cat 2	MEC Items	MD Items[2]
projo, 81mm, mortar, HE, M43	8	4	4	3	5	3	1
projo, 60mm, mortar, illum, M83 series	1	1	1	1		1	
projo, 60mm, mortar, HE, M49 series	1	1	1		1	1	
projo, 60mm, mortar, HE, M720	1	1	1	1		1	
projo, 37mm, LE, MK I	2	2	2		2	1	1
projo, 37mm, LE, MK II	1	1	1		1	1	
projo, 75mm	2	2	2	1	1		2
Assorted MD Components[3]	2	2	2		2		2
QC seed	32	30	30	29	3	NA	NA
QA validation seed	68	66	66	47	21	NA	NA

[1]In some instances multiple targets were associated with the same subsurface object.
[2]An MD item can be a TOI if it is sufficiently intact (i.e., having the requisite size, symmetry, and wall thickness) to match the physical properties of a potential MPPEH item.
[3]Assorted MD components are remnants of military munitions (e.g., fragments, projectiles, shell casings, fins) that do not present a hazard.

3.3.2 Analog Data Gap Investigation

On Orion Road, intrusive investigation results included 3,847 individual analog investigations in 40 grids totaling 0.37 acres. The UXO Teams recovered 294 pounds of MD, 2 UXO items, and 42 QC seeds during this intrusive investigation on Orion Road. On Watkins Gate Road, intrusive investigations resulted in 364 individual analog investigations in 26 grids totaling 0.26 acres. The UXO Teams recovered 285 pounds of MD, one UXO item, 31 QC seeds, and one QA seed during this intrusive investigation on Watkins Gate Road. The subsurface removal in all analog data gaps

investigated was subjected to standard QC and QA inspections, and all data gaps passed inspection. Table 5 includes a summary of the analog data gap investigations performed from October 31, 2023, through November 17, 2023. Figure 4 includes the completed data gap areas located on Orion Road north of Hawkeye Road (grids OR086-OR135) and Watkins Gate Road (grids WG146-WG186).

Table 5. Analog Data Gap Investigation Summary

Road	Acreage Completed	Grids Completed	Number of Investigations	LBs MD	MEC Items	QC Seeds	QA Seeds	UXO QC Approved	UXO QA Approved
Orion Road	0.37	40	3,847	294.25	2	42	0	40	40
Watkins Gate Road	0.24	26	364	285.5	1	31	1	26	26

4.0 Quality Control

Quality control of MM2x2 data, processing and classification was conducted by the QC Geophysicist and the Program QC Geophysicist. Data that had undergone quality verification by the data processor was provided to the QC Geophysicist for validation prior to data processing and classification. The QC Geophysicist validated the data quality by monitoring the data for agreement with the MQOs in the *AGCMR-QAPP Addendum* (KEMRON, 2023) Worksheet #22 and returned the data to the data processor for completion of data classification. The QC Geophysicist also validated the completeness and quality of the site-specific classification library. The QC Geophysicist provided all final work products relating to the AGC data to the Program QC Geophysicist for final review. The data processing, classification, and ranking process were verified against the MQOs in the *AGCMR-QAPP Addendum* (KEMRON, 2023) Worksheet #22.

4.1 Blind Seeding Program

During the 2023 fieldwork, 30 QC seed items in grids OR086-OR135 and WG146-WG186 were recovered during subsurface removal operations in accordance with the seed item recovery MQO established in the *AGCMR-QAPP Addendum* (KEMRON, 2023) Worksheet #22. The QC seed item recovery information is summarized in Table 6, and the locations are displayed on Figure 7. For additional information on the comprehensive Fuel Break System Blind Seeding Program refer to Section 2.1 and Appendix A.

Table 6. Quality Control Seed Information

Seed Identification	X	Y	Horizontal Offset (inches)	Comment

4.1.1 Analog Data Gap Investigation Blind Seeding Program

For the analog subsurface removal grids, 73 QC seeds were placed in the subsurface to allow for additional QC of the analog subsurface removal operations. Table 5 includes a summary of the analog data gap investigations performed from October 31, 2023, through November 17, 2023. The recovery of 73 QC seeds met the minimum requirement of one seed per day per team for analog subsurface removal grids.

Additionally, daily QC occurred for the EM61 when operating in analog mode (i.e., when performing the analog subsurface removal). This daily QC consisted of a static background and static response test. The EM61 operator located an area of background response where the instrument was nulled. Then, a standard response item (small ISO or equivalent) was placed directly above or below the sensor coil. Care was taken to ensure the positioning of the test item was identical for each test. The Team Leader recorded the Channel 2 response of the test item in their logbook, ensuring that it was within +/- 10% of the first day's response. After 30 seconds, the test item was removed, and the response data was observed to confirm that the reported response returned to a null value.

4.2 Measurement Quality Objectives

Performance relative to the MQOs was assessed during the processing and analysis of the data. MM2x2 data were not used to classify targets until these MQO were shown to have been met. Performance relative to key MQOs is shown in the *AGCMR-QAPP Addendum* (KEMRON, 2023) Worksheet #22.

4.3 Instrument Verification

Instrument verification occurred during previous supplemental subsurface MEC removal documented in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

5.0 Data Verification and Validation

Data verification and validation activities were conducted throughout the course of the MEC removal data acquisition, processing and analysis, and intrusive investigation activities. Verification and validation activities are described in the Geophysical Classification Validation Plan (Appendix B) and summarized in the sections below. Results of the verification and validation investigations are presented in Section 5.3.

5.1 Quality Assurance Validation Seeding

The USACE QA Geophysicist placed an unknown number of blind subsurface QA validation seed items across the subsurface removal area prior to the MM2x2 investigation. QA validation seed items consisted of small ISO-80 and were placed at depths between 6 and 12 inches below ground

surface. The integrity of the QA validation seeding program was maintained by keeping QA validation seed item information known to the data acquisition, processing and analysis, intrusive investigation, and QC personnel until the initial classification results were submitted and the successful identification of all QA validation seed items was confirmed by the QA Geophysicist. At the time, QA validation seed items were placed in the fuel breaks on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). Information for the QA validation seed items buried in these grids had not been revealed to KEMRON, however, the USACE QA Geophysicist had confirmed that these seed items were correctly identified and classified during the MM2x2 investigation and included in the 1,543 remaining anomalies.

QA validation seeding occurred during previous supplemental subsurface MEC removal documented in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

5.1.1 Analog Data Gap Investigation Quality Assurance Validation Seeding

One QA seed (UXO_1; WATKINS GATE RD; WG185-G) was recovered on November 8, 2023, from the data gap investigation areas. Table 5 includes a summary of the analog data gap investigations performed from October 31, 2023, through November 17, 2023.

5.2 Root Cause Analysis and Corrective Action

In 2020, a corrective action plan was implemented in response to misclassifying QA validation seed, QAS 009. Section 2.5.8.1 summarizes the root cause analysis and corrective action plan. The CA was implemented and completed at the end of the 2020 phase of work, prior to any work being performed in 2023. The Project QC Geophysicist confirmed that the dig lists were reviewed and required changes in response to the CA were applied and included in the 2023 investigation.

During the 2023 fieldwork, no additional root cause analysis and corrective action was required because the supplemental subsurface MEC removal within portions of Orion and Watkins Gate Roads were completed in accordance with the *Site Specific Work Plan Fuel Breaks Supplemental Subsurface Munitions and Explosives of Concern Removal, Impact Area Munitions Response Area Former Fort Ord, California Orion Road and Watkins Gate Road* (KEMRON, 2023a)

5.3 Classification Verification and Validation

Appendix B, Geophysical Classification Verification and Validation Plan, describes procedures for verifying and validating the classification results of the fuel breaks supplemental subsurface MEC removal on Orion Road and Watkins Gate Road. Included in the targets selected for intrusive investigation and subsurface removal on Orion Road and Watkins Gate Road were verification and validation investigations. These verification and validation investigations included the following:

- 200 QC verification investigations
- 200 QA validation investigations

As discussed in Appendix B, to adequately verify the library match thresholds and conform with the DAGCAP requirements, the next 200 targets with library match decision metrics below the final TOI recovered from the ranked dig list should be intrusively investigated. The lowest-ranked target that resulted in the recovery of a TOI was target OR109_132008_001_11, which had a decision statistic of 0.9281. 118 Category 2 targets were ranked lower on the dig list and were intrusively investigated during normal production activities. Therefore, 82 additional digs were required to meet the requirement of 200 total digs after the last TOI.

The final identity, quantity, and distribution of intrusive investigations necessary to verify and validate the classification process has been determined during classification activities and is based on specific details of the classification approach, intrusive investigation results, and the classification performance demonstrated by QC and QA seed item identification. The library match verification process resulted in 200 verification investigations and the USACE QA Geophysicist added 200 validation investigations. No TOI were recovered from the verification and validation investigations, successfully demonstrating effectiveness of the RA.

5.3.1 Dynamic Detection Threshold Verification (Previous Fieldwork)

Dynamic detection threshold verification occurred during previous supplemental subsurface MEC removal documented in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

5.3.2 General Quality Control Verification (Previous Fieldwork)

General QC verification occurred during previous supplemental subsurface MEC removal documented in the *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a).

5.3.3 Library Match Threshold Verification

Intrusive investigation of 200 anomalies ranked immediately below the lowest-ranked TOI recovered from the ranked classification dig list was required to verify that the library match threshold was appropriately selected to identify TOI. Included in the dig list were 118 anomalies ranked lower than the last recovered TOI, each of which were investigated as part of routine intrusive investigation activities. Intrusive investigation of 82 additional anomalies occurred to adequately verify the library match thresholds. No TOI were recovered from the 200 intrusive investigations after the last TOI, and the library match threshold was therefore successfully verified. Additional information is included in the Geophysical Classification Verification and Validation Plan (Appendix B).

5.3.4 Modeled Depth Verification

The classification process resulted in a modeled depth for each classified target. Verification of modeled TOI depths is built into the processing and classification scheme. Recovery depths of recovered items were recorded by the intrusive investigation team and compared to the modeled depths from the classification results to successfully verify that recovered TOI depths matched the modeled depths. The analysis of recovery depths for the classified targets verified that the recovered items were within 6 inches of their modeled depths, including cases where a single anomaly source was related to more than one measured target. Section 6 in Appendix B includes additional information.

5.3.5 Quality Assurance Validation Investigations

After completion of subsurface removal of the targets classified as TOI, the USACE Project Geophysicist selected 200 QA validation investigations for reacquisition and intrusive investigation as overall validation of the classification process to confirm that MEC items have not been left in place. Reacquisition and intrusive investigation were conducted in the same manner as that of the targets classified as TOI. The 200 QA validation investigations, including investigation results, are listed in Appendix E. The Program Geophysicist, Program QC Geophysicist, and Project Geophysicist provided their rationales for not selecting them for intrusive investigation, and the dig results validated those decisions (discussed in the subsequent section, and in Section 7 of Appendix B).

No TOI were recovered from the validation investigations, providing validation of the effectiveness of the entire classification process.

5.3.6 Verification and Validation Results

Appendix B, Geophysical Classification Verification and Validation Plan, describes procedures for verifying and validating the classification results of the fuel breaks supplemental subsurface MEC removal on Orion Road and Watkins Gate Road. Verification of the library match thresholds involves sampling through intrusive investigation of anomalies beyond the selected Category 2 threshold. To adequately verify the library match thresholds and conform with the DAGCAP requirements, the next 200 targets with library match decision metrics below the final TOI recovered from the ranked dig list were intrusively investigated. The lowest-ranked target that resulted in the recovery of a TOI was target OR109_132008_001_11, which had a decision statistic of 0.9281. 118 Category 2 targets were ranked lower on the dig list and were intrusively investigated during normal production activities. Therefore, 82 additional digs were required to meet the requirement of 200 total digs after the last TOI. A total of 282 verification and validation investigations were completed. Of the 282 verification and validation investigations, 214 were located on Orion Road and 68 on Watkins Gate Road.

Two hundred of the 282 verification and validation targets were selected by the USACE QA Geophysicist as non-TOI targets from the final ranked classification list for intrusive investigation.

The Lead Data Processor delivered written rationale for the decision to classify each of the 200 anomalies as non-TOI, and the explanations were validated against the intrusive investigation results. All 200 validation digs were intrusively investigated. No TOI were recovered from the validation investigations, providing validation of the effectiveness of the entire classification process.

No TOI were recovered from the verification and validation investigations. Additionally, non-TOI MD items were not recovered during the verification and validation investigations. The successful completion of the verification and validation investigations constituted the final subsurface MEC removal process validation.

6.0 Conclusions

The 25.5 acres of supplemental subsurface MEC removal in the Impact Area MRA Fuel Breaks is complete. The majority of this work was completed in 2020 and prior. The remaining work, on portions of Orion Road and Watkins Gate Road, was completed in 2023.

6.1 Supplemental Subsurface MEC Removal Results

A total of 23,023 anomalies were identified from the MM2x2 dynamic detection data that potentially represented subsurface MEC items in the supplemental subsurface MEC removal area in the Impact Area MRA fuel break system. The MM2x2 was utilized to acquire static classification data measurements over each identified anomaly. The MM2x2 data was inverted and analyzed to estimate the intrinsic physical features of each anomaly source, allowing a comparison of the measured data to a site-specific TOI signature library and classification of each anomaly as a TOI or a non-TOI.

The classification process resulted in the identification of 11,416 anomalies for intrusive investigation and subsurface removal. The *DRAFT FINAL Volume 2, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area Former Fort Ord, California* (KEMRON, 2021a) documented successful removal of the first 9,873 anomalies.

The remaining intrusive investigation of 1,543 targets representing potential TOI was completed between September 18, 2023 through November 21, 2023 in accordance with the *Site Specific Work Plan Fuel Breaks Supplemental Subsurface Munitions and Explosives of Concern Removal, Impact Area Munitions Response Area Former Fort Ord, California Orion Road and Watkins Gate Road* (KEMRON, 2023a). This investigation resulted in the recovery of 110 actual TOI from 1825 target locations, including eight UXO items and one MD item. The recovered TOI also included assorted MD components (results from two TOI) and three MD items sufficiently intact (i.e., having the requisite size, symmetry, and wall thickness), 30 QC seed items, and 66 QA seed items. Three additional UXO items were recovered during analog subsurface removal in data gaps in the MM2x2 survey. Figure 5 and Table 7 provide a summary of the final status of MPPEH items encountered during the 2023 supplemental subsurface MEC removal fieldwork.

Table 7. Final Status of Recovered MPPEH from the 2023 Supplemental Subsurface MEC Removal Fieldwork

6.2 Accomplishment of Supplemental Subsurface MEC Removal Objectives

Based on the completion of the MM2x2 investigation and classification process, the associated removal of TOI, and the demonstrated absence of TOI remaining in the selected anomaly population, the supplemental subsurface MEC removal objective has been successfully met for the completed portions of the subsurface removal area.

Appendix A Quality Control Seeding Report

Quality Control Seeding Report – Supplemental Subsurface MEC Removal, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California

PREPARED FOR:	Curtis Payton/USACE
	Kyle Lindsay/USACE
PREPARED BY:	Andy Gascho/Gilbane
COPIES:	Steve Crane/KEMRON
	Erin Caruso/Gilbane
	Jeff Sabol/KEMRON
	Alex Kostera/NAEVA
DATE:	November 5, 2019

Prior to supplemental subsurface MEC removal geophysical classification activities in the Impact Area MRA fuel breaks at the Former Fort Ord, the remedial action area was seeded with subsurface quality control (QC) seed items to provide verification of data acquisition, processing and analysis, classification, and intrusive investigation performance. QC seeding was accomplished in accordance with Standard Operating Procedure (SOP) AGCMR-03 - Quality Control Seeding for Advanced Geophysical Classification in Appendix B of the *Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (AGCMR-QAPP; KEMRON, 2016) as modified for MetalMapper 2x2 (MM2x2) by FWV 012 (KEMRON, 2018).

QC seed items consisted of small schedule-80 industry standard objects (ISO). 78 QC seed items were buried 6 inches below ground surface in anticipation of encountering at least one seed item during each day of cued classification data acquisition. Seed items were emplaced by the QC Geophysicist and a UXO Technician II utilizing anomaly avoidance techniques and real-time kinematic global positioning system for location measurement and recording of burial information. QC seed item locations were camouflaged with dirt or vegetation to hide ground disturbance, and no QC seed items were placed in paved areas.

To maintain the integrity of the QC program, seed item burial information was not provided to personnel involved in data acquisition, processing, or intrusive investigation activities until

those activities were completed, the initial classification results were submitted by the Project Geophysicist to the USACE Quality Assurance (QA) Geophysicist, and the successful identification of all QC seed items was confirmed by the QC Geophysicist and the QA Geophysicist. QC seeding results are reported in the *Technical Information Paper, Supplemental Subsurface MEC Removal, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California*. Additional validation seed items were emplaced by the USACE QA Geophysicist, details of which were unknown to the contractor team at the time of field work. Details of the validation seeding program are also presented in the Supplemental Subsurface MEC Removal Technical Information Paper.

30 of the emplaced QC seed items were located on Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186). The supplemental subsurface MEC removal in these grids will be completed under a future contract, and QC seed item burial information is therefore not presented in this QC seeding report. Burial information for the 48 QC seed items located in the portions of the fuel breaks where the supplemental subsurface removal has been completed is included in **Table 1**, and seed item burial locations are displayed on **Figure 1**.

1 Introduction

This Geophysical Classification Verification and Validation Report has been developed to describe procedures for verifying and validating the classification results of the Fuel Breaks Supplemental Subsurface Munitions and Explosives of Concern (MEC) Removal on Orion Road and Watkins Gate Road at the former Fort Ord, California. The work is being conducted under Contract W9123820D0004, Delivery Order W9123822F0043 (KEMRON TO 04). The intent of the verification and validation process is to provide assurance that targets of interest (TOI) in the survey area have been correctly classified and identified for removal and that no TOI have been classified as non-TOI and left in place. The verification and validation process involves the following quality demonstrations:

- Selection and intrusive investigation of verification and validation digs from the population of sources classified as non-TOI to demonstrate that sources have been correctly classified.
- Verification of targets classified as TOI by comparing the predicted position, depth and size to the actual intrusive results.

This report presents the rationale for the verification and validation approach and the description of the verification and validation process and results. The identity, quantity, and distribution of intrusive investigations necessary to verify and validate the classification process has been determined during the course of classification activities and is based on specific details of the classification approach, intrusive investigation results, and the classification performance demonstrated by quality control (QC) and quality assurance (QA) seed item identification.

2 Background

There are two components to the MEC removal activity: identification of subsurface anomalies from an initial dynamic MetalMapper 2x2 (MM 2x2) detection advanced geophysical classification (AGC) survey, followed by a static (or cued) MM 2x2 classification survey of those identified anomalies. The initial detection survey is the first step in the classification process whereby anomalies are selected or rejected based upon a detection threshold. Once an anomaly has been identified and a static MM 2x2 measurement acquired, the anomaly can be classified as a TOI if it meets any of the following criteria:

1. The source signature matches (within specifications established in Advanced Geophysical Classification for Munitions Response – Quality Assurance Project Plan (AGCMR-QAPP), Worksheet 22) that of an item in the project-specific TOI library
2. The source signature is consistent with the characteristics of a MEC item (size, shape, symmetry, and wall thickness) thought to exist at the site
3. The source is one of a cluster of three or more similar-signature sources identified as TOI through intrusive investigation

The goal of the verification and validation process is to demonstrate that no TOI are classified as non-TOI. The above criteria can be restated in terms of how sources are classified as non-TOI. A source is classified as a non-TOI if it meets any of the following criteria:

1. The source signature does not match (within specifications established in AGCMR-QAPP, Worksheet 22) that of an item in the project-specific TOI library
2. The source signature is not consistent with the characteristics of a MEC item (size, shape, symmetry, and wall thickness) thought to exist at the site
3. The source does not belong to a cluster of similar-signature anomalies identified as TOI through intrusive investigation

The following discussion presents the approach to classification verification and validation for the cued mode of classification, with emphasis on describing what components are tested and the rationale for these tests. Any verification and validation failure will require a root cause analysis and appropriate corrective action developed and implemented in consultation with the U.S. Army Corps of Engineers

(USACE). Note that the verification and validation of the dynamic mode was successfully completed under a previous contract.

3 Library Match Threshold Verification

Cued classification is based primarily on the fit metrics generated by the Geosoft Oasis Montaj UX-Analyze module during a comparison of the polarization (β) values estimated for each surveyed anomaly and the β values in the classification library developed for the project. The fit metric indicates the fit correlation between an anomaly and the item in the library that best matches it. The fit metric ranges from 0 to 1, with a fit metric of 1 being a perfect match. The library fit analysis matches the following combinations of βs to those of the classification library TOIs:

1. β1, β1/β2, β1/β3
2. β1, β1/β2
3. β1/β2, β1/β3
4. β1

The confidence metrics for each fit combination are averaged to derive a decision metric. The library matching process is performed for each single-target model and every target in each of the multi-target models. For each measured anomaly, the highest value decision metric (i.e., most likely TOI) from the combined set of single-solver and multi-solver targets is used as the decision metric for that anomaly.

Cut-off thresholds are determined based upon review of the decision metrics derived for known targets (QC seeds, bench measurements and training dig results) and are used to rank and classify the target list. Decision metric values above the thresholds are classified as TOI, and values below the decision metric thresholds are classified as non-TOI. The TOI library match decision metric thresholds are shown in the table below.

Target of Interest Library Match Decision Metric Thresholds

Category	Description	Decision Statistic Threshold[1]	Decision Statistic Lower Boundary[2]	Additional Condition
1	High-confidence TOI	0.97	0.95	
2	Low-confidence TOI	0.92	0.825	
2	Low-confidence TOI	0.92	0.75	Good visual match, with a cluster, high fit coherence

[1]All targets with a decision statistic above the threshold appear in the corresponding category on the final ranked target list.

[2]The lowest decision statistic for a target in the corresponding category. Targets with a decision statistic below the threshold can be renamed as designated to a higher category based on the analyst's visual review of the polarizabilities and the interpretation of the target's size, shape, and wall thickness.

Note: The term "inconclusive" in Appendix D of Vol 2 would have been more accurate if Category 2 targets were listed as "low-confidence TOI".

Verification of the library match thresholds involves sampling through intrusive investigation of anomalies beyond the selected Category 2 threshold. The number of digs required to achieve verification depends to a large degree on intrusive investigation results – in particular the results for the lowest-ranked anomalies that result in the recovery of TOI. Partial receiver operating characteristic (ROC) curves showing a steep ascent early in the prioritized list (indicating most targets are TOI), followed by a small section of no vertical (Y direction) gain indicating the absence of TOI in the latter part of the prioritized list are indicative of successful classification. Partial ROC curves that do not display a distinct inflection point between the TOI and non-TOI sections, and that have TOI in close proximity (on the prioritized list) to the library match threshold require more verification digs. To adequately verify the library match thresholds and conform with the DAGCAP requirements, the next 200 targets with library match decision metrics below the final TOI recovered from the ranked dig list should be intrusively investigated. The lowest-ranked target that resulted in the recovery of a TOI was target OR109_132008_001_11, which had a decision statistic of 0.9281. 118 Category 2 targets were ranked lower on the dig list and were intrusive investigated during normal production activities. Therefore, 82 additional digs were required to meet the requirement of 200 total digs after the last TOI. No TOI were recovered from the 200 intrusive investigations after the last TOI, and the library match threshold was therefore successfully verified.

4 Cluster Analysis Verification

The cluster analysis is designed to detect unanticipated TOI in the investigation area by identifying existing groups of anomalies with similar βs that do not match any of the classification library TOI. Select sources within these clusters are intrusively investigated to determine if the clusters are comprised of TOI or non-TOI. Within any such cluster, the individual items will all be very similar in size, shape and composition. The β signature of any cluster that is identified as TOI is added to the classification library, and the items in the cluster are classified as TOI.

Verification of the cluster analysis is accomplished through intrusive investigation of a total of 171 clustered targets not initially classified as TOI. No TOI were recovered from these 171 intrusive investigations, and the completeness of the classification library was therefore successfully verified.

5 Feature Analysis Verification

Like the cluster analysis, the feature analysis is designed to detect unanticipated TOI in the investigation area. This is accomplished by identifying individual sources with βs indicating physical features that are typical of TOI but do not match any of the classification library items. These sources are intrusively investigated to determine if their sources are TOI or non-TOI. The β signature of any item that is identified as a TOI is added to the classification library, and the item is classified as a TOI.

Verification of the feature analysis is accomplished through the library match verification and cluster analysis verification processes described in Sections 3 and 4. The intrusive investigation of at least 200 targets ranked below the final recovered TOI verifies that targets with features consistent with MEC items have been identified and classified as TOI. The intrusive investigation of 171 targets not classified as TOI but displaying βs clustered in the high amplitude, slow decay area of the feature space plot verifies that targets with MEC-like characteristics have been identified as TOI on the ranked classification list. No TOI were recovered from the 200 library match threshold verification investigations or from the 171 cluster analysis verification investigations, providing verification that targets with MEC-like characteristics have been identified as TOI on the ranked classification list.

6 Modeled Parameter Verification

The classification process results in a modeled parameters (position, depth, size and shape) of each classified target. Verification of modeled TOI depths is built into the processing and classification scheme. Recovery positions, depths and size of all recovered items are recorded by the intrusive investigation team and compared to the modeled parameters from the classification results to verify that recovered TOI match the predictions as described in ANJV SOP9.

All verification targets passed the intrusive survey MQOs as defined in Worksheet 22 of the AGCMR-QAPP, or a justification was given. There were three main reasons for a mismatch between the recovered object and the analysis predictions.

1. The target was dug because it was in the "Cannot Analyze" category. The predicted results cannot be trusted for targets in this category because the data do not support confidence in the inversion results. Additionally, there were 137 locations that were not cued by the MM2x2 sensor and therefore did not have predictions for the comparison.
2. The source of the anomaly produced a weak response. A small item is often recovered but due to signal-to-noise issues the inversion routine is often driven toward a larger and deeper source.
3. A multi-solver source was selected as having the highest decision metric when the single solver was more appropriate, or vice versa. The classification process analyzes the fit results of the six sources output from the 1, 2 and 3 source dipole solvers and conservatively selects the source with the highest decision metric. This can result in mismatches especially when a 3-source solver was used to model an anomaly consisting of a single source.
4. The source of the anomaly was located in the road where grading was suspected. This would cause depth comparison mismatches if the source's depth below ground surface changed between the AGC survey and the intrusive survey.

7 Quality Assurance Validation

In addition to the verification and validation investigations described above, the USACE QA Geophysicist selected 200 non-TOI targets from the final ranked classification list for intrusive investigation. The Lead Data Processor delivered written rationale for the decision to classify each of the 200 anomalies as non-TOI, and the explanations were validated against the intrusive investigation results. All 200 validation digs were intrusively investigated. No TOI were recovered from the validation investigations, providing validation of the effectiveness of the entire classification process.

8 Summary of Verification and Validation Investigations

The final identity, quantity, and distribution of intrusive investigations necessary to verify and validate the classification process has been determined during classification activities and is based on specific details of the classification approach, intrusive investigation results, and the classification performance demonstrated by QC and QA seed item identification. The library match verification process (Section 3) resulted in 200 verification investigations; the cluster and feature analysis verification processes (Sections 4 and 5) resulted in 171 additional cluster verification investigations; and the USACE QA Geophysicist added 200 validation investigations. No TOI were recovered from the verification and validation investigations, successfully demonstrating effectiveness of the remedial action.

Column Name	Description
UXA_ACQ_DATE	Data of Cued Measurement
UXA_GEO_ID	Geounit ID
UXA_FLAG_ID	Flag ID
UXA_TARGET_ID	UXAnalyze Target ID
UXA_FIT_X	Predicted location - UTM Easting (m) - NAD83 Zone 10N
UXA_FIT_Y	Predicted location - UTM Northing (m) - NAD83 Zone 10N
Fit_X_SP	Predicted location - State Plane Easting (ftUS) - NAD83 California Zone 4
Fit_Y_SP	Predicted location - State Plane Northing (ftUS) - NAD83 California Zone 4
Dig_X_UTM	Dig location - UTM Easting (m) - NAD83 Zone 10N
Dig_Y_UTM	Dig location - UTM Northing (m) - NAD83 Zone 10N
Dig_X_SP	Dig location - State Plane Easting (ftUS) - NAD83 California Zone 4
Dig_Y_SP	Dig location - State Plane Northing (ftUS) - NAD83 California Zone 4
UXA_Fit_BGS (m)	Predicted depth (m)
Fit_BGS_Inches	Predicted depth (in)
UXA_category	Classification Category (0-Can't Analyze, 1- Higher confidence TOI, 2- Lower confidence TOI, 3- High confidence nonTOI)
UXA_subcategory	Classification subcategory
UXA_decision_statistic	Classification decision statistic (0-1)
UXA_Size_Predicted	Predicted size (Small <40mm, Large>=105mm, Medium between small and large)
UXA_FIT_COH	Fit coherence - measure of mismatch between measured data and modeled data
UXA_SIG_AMPLITUDE	Peak signal response of MM2x2 cued measurement (mV/amp)
Dig_ID	Dig ID
Dig_Date	Data of intrusive investigation
Team_ID	Dig team ID
Item_type	Recovered item type
item_description_combined	Recovered item description
item_Within_10_Inches_of_Predicted_Position (X,Y)	Item recovered with 10 inches of predicted location (Y/N)
item_offset_distance_m	Recovered item offset distance if greater than 25cm (m)
item_offset_direction	Recovered item offset direction if offset distance is greater than 25cm
Item_depth_m	Recovered item depth (m)
item_quantity	Number of items recovered
item_lbs	Recovered item weight (lbs)
item_size	Recovered item size (Small <40mm, Large>=105mm, Medium between small and large)
UXA_Photo_ID	Recovered item photo filename
GeoQC_Comments	ANJV QC geophysicist comments
GeoQC_TOI_Interest	ANJV QC geophysicist IOC interpretation (Yes if an IOC)
Validation_Mask	Validation target - 1 is Yes
Validation_Comment	Data analyst validation comment
UXA_MASK_verification	Verification target - 1 is Yes

Appendix C Ranked Target List

Notes:

1. When a target ID resulted in assorted MD components and small arms, the OE type for the target is SAA (small arms ammunition).

2. Target 109136 was placed on dig list for intrusive investigation but was not cued. No predicted depth was associated with this target given there was no associated cued measurement. The dig team encountered no audible response at the target location and dug to 25 inches before stopping as no item was encountered.

Appendix E Quality Assurance Validation Investigations

Flag ID	Grid ID	X[i]	Y[1]	Non-TOI Decision Rationale
154058	OR131	5744876.06	2118113.41	Separation between b2/b3 and b1/b2/b3 is not TOI-like
140020	OR117	5745238.62	2116808.54	Separation between b2/b3 and positioning and slow late time decay of b1/b2/b3 not TOI-like
112028	OR089	5746327.65	2114697.02	Decay b1 and separation of b2/b3 not TOI-like
109003	OR086	5746522.10	2114515.13	Betas show quick decay of a thin-walled object; not TOI-like
224041	WG173	5748172.08	2117088.93	Early time decay not TOI-like
145017	OR122	5745033.04	2117237.53	Separation between b2/b3 is not TOI-like
147044	OR124	5744953.77	2117417.50	Separation, shape, and noisy decay of betas is not TOI-like
237004	WG186	5748609.86	2118257.43	Separation between b2/b3 is not TOI-like
114008	OR091	5746167.68	2114838.90	Positioning of b1/b2 offset from best library match, b3 late-time decay does not match decay curve of best library match
206014	WG155	5746527.84	2116294.00	Decay and positioning of b1 not TOI-like
220024	WG169	5747818.38	2116883.12	Poor b3, b1/b2 late time not TOI-like
210006	WG159	5746991.93	2116389.37	Separation between b2/b3 is not TOI-like, decay and positioning of b1 not TOI-like
126015	OR103	5745798.94	2115717.34	Separation between b2/b3 is not TOI-like, positioning of b1 not TOI-like, not axially symmetric
144042	OR121	5745101.77	2117142.42	Separation between b2/b3 is not TOI-like, late-time decay of all betas slower than best library match
154057	OR131	5744879.91	2118086.69	Separation between b2/b3 is not TOI-like, positioning of b1/b2/b3 not TOI-like, not axially symmetric
143020	OR120	5745132.48	2117106.80	Separation between b2/b3 is not TOI-like, positioning of b1/b2/b3 not TOI-like, not axially symmetric
144131	OR121	5745070.53	2117202.59	Separation between b2/b3 is not TOI-like, positioning of b1/b2/b3 not TOI-like
111036	OR088	5746336.78	2114662.88	Separation and positioning of b2/b3 is not TOI-like
109045	OR086	5746507.93	2114474.11	Separation between b2/b3 is not TOI-like, late-time decay of all betas slower than best library match
143136	OR120	5745153.98	2117057.49	Separation between b3 and b1/b2 is not TOI-like, decay of betas does not match decay curve of best library match
153037	OR130	5744894.46	2117997.29	Separation between b2/b3 is not TOI-like, not axially symmetric, b2 late-time decay slower than best library match
147025	OR124	5744946.77	2117416.84	Separation between b2/b3 is not TOI-like, late-time decay of all betas slower than best library match
111024	OR088	5746401.53	2114595.46	Separation between b2/b3 is not TOI-like, late-time decay of all betas slower than best library match
212004	WG161	5747120.51	2116439.20	Separation between b2/b3 is not TOI-like, late-time decay of all betas slower than best library match
237044	WG186	5748625.83	2118266.81	Separation between b2/b3 is not TOI-like, positioning and decay of betas does not match decay curve of best library match
116061	OR093	5746049.70	2114960.77	Separation and positioning b2/b3 is not TOI-like, elevated late-time decay of all betas
115020	OR092	5746124.10	2114883.38	Separation and positioning b2/b3 is not TOI-like, elevated late-time decay of all betas
111034	OR088	5746345.20	2114666.27	Positioning and decay of betas does not fit to best library match
153119	OR130	5744910.15	2117964.37	Separation between b2/b3 is not TOI-like, not axially symmetric, slower late-time decay
145036	OR122	5745023.54	2117252.78	b2/b3 separation not TOI-like, not axially symmetric, slower late time decay all betas
155032	OR132	5744902.51	2118203.59	Poor b3, late-time decay of all betas slower than best library match
128053	OR105	5745778.61	2115901.81	Separation between b2/b3 and positioning of b1 not TOI-like, not axially symmetric
156003	OR133	5744898.17	2118263.25	Poor b3, decay and positioning of b1 not TOI-like
156147	OR133	5744886.28	2118248.44	Separation between b2/b3 and positioning of b1 not TOI-like, not axially symmetric
139067	OR116	5745245.87	2116699.45	Poor b3, b1/b2 mid-late time decay not TOI-like
109029	OR086	5746501.21	2114547.10	Separation between b2/b3 and positioning of b1 not TOI-like, slower late time decay
122007	OR099	5745620.17	2115347.25	Separation between b2/b3 and positioning of b1 not TOI-like, slower late time decay
216002	WG165	5747517.79	2116676.88	Noisy separation b2/b3, b1 positioning not TOI-like
116003	OR093	5746050.86	2114964.09	Separation between b2/b3 and positioning of all betas not TOI-like, slower late time decay
146006	OR123	5745017.35	2117325.25	Separation and positioning b2/b3 not TOI-like, slower late time decay
121030	OR098	5745625.94	2115170.35	b1/b3 early time drift and noise
124035	OR101	5745685.64	2115452.30	Poor b3, late-time decay of all betas slower than best library match
230021	WG179	5748408.74	2117629.10	Poor b3, b1/b2 offset from best library match
145058	OR122	5745021.00	2117305.72	Poor b3, b1/b2 noisy and offset from best library match
114039	OR091	5746148.08	2114873.98	Separation between b2/b3 and positioning of b1 not TOI-like
128066	OR105	5745775.62	2115907.24	Separation between b2/b3 and positioning of b1 not TOI-like, slower late time decay
139004	OR116	5745270.61	2116696.26	Poor b3, decay/positioning of b1/b2 not TOI-like
224002	WG173	5748172.46	2117088.46	Separation between b2/b3 is not TOI-like, positioning of b1/b2/b3 not TOI-like
200002	WG149	5746031.63	2116147.46	Separation between b2/b3 and positioning and decay of b1/b2/b3 not TOI-like, not axially symmetric

Appendix F Responses to Comments

RESPONSES TO COMMENTS

Document Title:	Draft Volume 3, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area, Former Fort Ord, California, October 2024
Commenting Organization:	United States Environmental Protection Agency Region IX
Commenter Name:	Maeve Clancy
Date of Comments:	December 5, 2024

GENERAL COMMENT 1:

The MEC Removal Report presents confusing information regarding the locations of munitions and explosives of concern (MEC). For example, Section 1, Introduction, states "This technical information paper (TIP) describes the work elements and results for the supplemental subsurface MEC removal conducted within portions of Orion Road and Watkins Gate Road." However, the Executive Summary states "This includes portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road," which conflicts with the statement in the Introduction. In addition, Table 1, Supplemental Subsurface Removal Summary (Totaling 25.5 Acres," includes the seven roads listed in the Executive Summary. Please revise the MEC Removal Report to clearly identify the exact locations where the supplemental subsurface MEC removal occurred.

RESPONSE TO GENERAL COMMENT 1:

This Technical Information Paper (TIP) describes the work elements and results for a portion of the supplemental subsurface MEC removal conducted within portions of Orion Road and Watkins Gate Road in the Impact Area Munitions Response Area (MRA) permanent fuel break system at the former Fort Ord, California. This fieldwork, completed in 2023, addressed approximately 10 acres of the larger supplemental subsurface MEC removal effort in the Impact Area MRA. The total supplemental subsurface removal encompasses 25.5 acres, including portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road. To clarify these details, the Executive Summary will be updated with the following paragraph.

"This Technical Information Paper (TIP) describes the work elements and results of supplemental subsurface MEC removal conducted in 2023 within a portion of Orion Road and Watkins Gate Road in the Impact Area Munitions Response Area (MRA) permanent fuel break system at the former Fort Ord, California. This fieldwork represents the final phase of MEC removal in the permanent fuel break system and addressed approximately 10 acres of the larger effort, which encompassed portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road, totaling 25.5 acres."

SPECIFIC COMMENT 1:

Executive Summary, Page v, and Section 1.3, Supplemental Subsurface MEC Removal Objectives, Page 4: The second bullet point in this section describes a "High pre-analog anomaly survey density" but does not define the number of anomalies per square acre that characterize a high pre-analog anomaly density. Please revise the Executive Summary and Section 1.3 to define the number of anomalies per acre that characterize a high pre-analog anomaly density.

RESPONSE TO SPECIFIC COMMENT 1:

The "pre-analog anomaly survey density" is greater than 900 targets per acre in adjacent grids. Previous work leading to the decision to conduct the supplemental subsurface MEC removal in the 25.5 acres is summarized in Section 1.2. Several phases of quality control (QC) had been performed on a subset of the system of permanent fuel breaks where subsurface removal was conducted prior to the Track 3 Record of Decision. The supplemental QC investigation concluded in 2018 "the portions of the Impact Area MRA fuel break system where MEC and MEC-like MD items are most likely to remain after previous subsurface MEC removal operations correlate to the parts of the Impact Area MRA where 81mm mortars [greater than 2 feet in depth] are most likely to be present (based on where they have been recovered in previous activities) and where densities of subsurface anomalies prior to subsurface removal activities (derived from DGM data in grids adjacent to the fuel break segments) are greatest, specifically anomaly densities greater than 900 anomalies per acre." The information is summarized in Section 1.2. The results of the supplemental QC investigation are detailed in the report included in Field Work Variance 017 (OE-0685D.14). No changes will be made to the document in response to this comment.

SPECIFIC COMMENT 2:

Executive Summary, Page v: This section states "This includes portions of Hawkeye Road, Impossible Canyon Road, Mercury Road, Nowhere Road, Orion Road, Riso Ridge Road, and Watkins Gate Road," but it is unclear what "This" references. While it is assumed "This" references the Impact Area MRA [Munitions Response Area] fuel breaks, please revise this sentence of the Executive Summary to replace "This" with "Impact Area Munitions Response Area fuel breaks" for clarity.

RESPONSE TO SPECIFIC COMMENT 2:

A paragraph will be added to the Executive Summary for clarification. Please also see response to General Comment 1.

SPECIFIC COMMENT 3:

Executive Summary, Page v: This section states "As of November 21, 2023, the 25.5 acres of supplemental subsurface MEC removal is complete," but does not state when the supplemental

subsurface MEC removal began. Please revise the Executive Summary to indicate when the supplemental subsurface MEC removal began.

RESPONSE TO SPECIFIC COMMENT 3:

As stated in the Executive Summary, the supplemental subsurface removal was conducted primarily by advanced geophysical classification (AGC) with MetalMapper 2x2 (MM2x2) and intrusive investigation of anomalies classified as potential targets of interest (TOI). As detailed in *Draft Final Volume 2, Technical Information Paper, Supplemental Subsurface MEC Removal, Fuel Breaks, Impact Area Munitions Response Area, Former Fort Ord, California* (OE-0985C), the supplemental subsurface MEC removal itself included four phases. The first was the analog subsurface removal in two grids that contained higher anomaly densities (greater than 2,000 anomalies per acre), completed in November 2018. The majority of the four phases was completed and reported in the TIP Volume 2. Intrusive investigation of the remaining 1,543 anomalies in portions of Orion Road and Watkins Gate Road was subsequently completed and reported in the TIP Volume 3. The timeframes of the field work associated with the four phases are summarized in Section 1.4. Intrusive investigation of the remaining targets began on April 11, 2019, and was completed November 21, 2023.

SPECIFIC COMMENT 4:

Executive Summary, Page v: This section states "because the anomaly densities were greater than 2,000 anomalies per acre," but does not specifically indicate that 2,000 anomalies per acre was used as the anomaly density that would trigger supplemental subsurface MEC removal. Please revise the Executive Summary to clearly state the anomaly density (e.g., 2,000 anomalies per acre) that was used to trigger supplemental subsurface MEC removal.

RESPONSE TO SPECIFIC COMMENT 4:

Please see responses to EPA Specific Comments 1 and 3. Anomaly densities greater than 900 anomalies per acre were part of the information supporting the decision to conduct the supplemental subsurface MEC removal in 25.5 acres. The AGC technique is effective across a range of anomaly densities. Two grids contained higher anomaly densities, exceeding 2,000 anomalies per acre; therefore, as described in the Executive Summary and Section 1.4, analog subsurface removal was conducted prior to the AGC data collection.

SPECIFIC COMMENT 5:

Section 2.1, Blind Seed Item Placement (Previous Fieldwork), Page 9: This section indicates that 78 quality control (QC) seed items were buried 6 inches below ground surface but does not discuss or summarize the effectiveness of the QC seeding program with regard to the number of seed items that were located. Please revise this section to include a discussion and summary of the effectiveness of the QC seeding program to assure the quality of the subsurface MEC removal activities was sufficient.

RESPONSE TO SPECIFIC COMMENT 5:

This following text will be added as the final paragraph of Section 2.1 to summarize the effectiveness of the QC Seeding Program:

"Based on the subsurface MEC removal operations in the supplemental area, 78 QC seed items were initially buried, with 30 specifically located in the Orion Road and Watkins Gate Road grids. During the recent subsurface removal operations, all 30 QC seed items were successfully recovered. Regarding the remaining 48 QC seed items from the supplemental area, one was removed after dynamic detection survey but before the static classification survey, and 47 were recovered during subsurface removal operations conducted between 2018 and 2020. In summary, all QC seed items have been accounted for and recovered, signifying that all QC issues related to seed item recovery have been fully resolved. This demonstrates the overall effectiveness of the QC Seeding Program in ensuring thorough subsurface MEC removal."

SPECIFIC COMMENT 6:

Section 3.2, Classification Results (Previous Fieldwork): Page 22: This section states "Of the 23,023 dynamic detection targets identified for static MM2x2 measurement, 6,673 were located in Orion Road north of Hawkeye Road (grids OR086-OR135) and on Watkins Gate Road (grids WG146-WG186) and 16,350 were located in other areas," but does not discuss where the other areas are located. Please revise this section to include a discussion of the locations of all of the 23,023 dynamic detection targets identified for static MM2x2 measurement.

RESPONSE TO SPECIFIC COMMENT 6:

The dynamic detection survey was conducted over the entire supplemental subsurface removal area in 2018-2019. Table 2 in Section 3.2 provides a summary of the classification results for the 23,023 anomalies. This TIP Volume 3 describes the work conducted within portions of Orion Road and Watkins Gate Road associated with the 6,673 anomalies. Those segments are shown in blue color on Figure 4. The "other areas" refer to the segments of the supplemental subsurface removal areas that were completed in 2020 and reported in the TIP Volume 2 (OE-0985C). Those segments are shown in purple color on Figure 4. Please refer to the TIP Volume 2 for additional information about the classification through intrusive investigation that resulted from the 16,350 anomalies.

KEMRON ENVIRONMENTAL SERVICES

RESPONSES TO COMMENTS

Document Title:	Draft Volume 3, Technical Information Paper Supplemental Subsurface MEC Removal Fuel Breaks Impact Area Munitions Response Area, Former Fort Ord, California, October 2024
Commenting Organization:	Fort Ord Community Advisory Group
Commenter Name:	Mike Weaver
Date of Comments:	December 2, 2024

COMMENT 1:

"The title of this document is confusing in that the discussion is the seeking out and removal of munitions and and scrap located in internal roads areas in the former Fort Ord Impact Area(s) and yet the Subject title refers to this as Fuel Breaks."

RESPONSE TO COMMENT 1:

The Impact Area Munitions Response Area (MRA) permanent fuel break system is based primarily on pre-existing Army fuel breaks . The system of permanent fuel breaks also serves as access roads throughout the interior of the MRA. The fuel breaks were designed to be 45 to 50 feet wide inclusive of drivable road of 15 to 20-foot width.

COMMENT 2:

"This document focuses mostly on Orion Road and Watkins Gate Road, the former being a North/South road, the latter being an East/West road. Both these roads go border to border in the designated Impact Area MRA. The FOCAG understands roads and areas widened next to roads, devoid of vegetation, can act as fuel breaks in a vegetation fire.

Question: Is BRAC planning more vegetation fires in the Impact Areas on former Fort Ord?
If so, when? The FOCAG opposes open air burning on former Fort Ord. PFAS and Munitions get burned and released into the atmosphere in the process. Neighboring communities get their homeowner's fire insurance rates raised or even cancelled. Also neighboring communities run the risk of the fire getting out of control as Army/BRAC fires have done before."

RESPONSE TO COMMENT 2:

Prescribed burning is a part of the selected remedy for the cleanup of munitions and explosives of concern (MEC) in the Impact Area MRA. Prescribed burns will be executed only when optimal burn conditions are imminent and other requirements (such as the availability of necessary equipment and resources, including contingency resources) are met. Multiple containment lines are established prior to a prescribed burn. These site preparation measures, along with the prescribed burn itself reduce overgrown vegetation, which, in turn, reduces the risk of wildfire.

The Army has evaluated the constituents of smoke generated during prescribed burns at Fort Ord, including an assessment of potential air emissions from incidental ordnance detonations during a prescribed burn (OE-0355), and conducted extensive air monitoring during the Ranges 43-48 prescribed burn in October 2003 (OE-0481J). The results of the air monitoring indicated that the resulting smoke is no different than smoke from vegetation burns of similar vegetation types. The Agency for Toxic Substances and Disease Registry conducted an independent evaluation of the 2003 air monitoring results and concluded that, no adverse health effects are expected (OE-0522). A prescribed burn is planned in 2025 outside the Impact Area MRA under a separate Record of Decision. Please refer to the Army's website https://fortordcleanup.com for additional information about the prescribed burn program.

COMMENT 3:

"Areas included in this supplemental subsurface removal include areas previously containing 81 mm mortar projectiles. Again it is below grade in roads, but referred to as fuel breaks in your Executive Summary, page v. and vi."

RESPONSE TO COMMENT 3:

The Impact Area MRA fuel breaks are inclusive of drivable roads. Please see the response to Comment 1.

COMMENT 4:

"How many fires does BRAC have records of that occurred in this Fort Ord MRA area before? How many were accidental? How many were Army Prescribed Burns?"

RESPONSE TO COMMENT 4:

The Army has conducted prescribed burns as part of the munitions responses at the former Fort Ord. A list of the Army's prescribed burns and other known burn events can be found in a 2018 Factsheet: Prescribed Burn Frequently Asked Questions: Former Impact Area (FS-04-09).

COMMENT 5:

"Page 2 of the document, Section 1.1 Site Location and History, should include the following; Fort Ord was an Army training base for WW1, WW2, Korean War, Viet Nam War. It should also disclose that Army tank training was conducted on former Fort Ord, and that Fort Ord was the West Coast Headquarters for the Combat Development Experimentation Command (CDEC). This disclosure of uses encompasses lots of different munitions, standard and experimental, as well as chemicals of concern to include PFAS and PFOS."

RESPONSE TO COMMENT 5:

Section 1.1 provides a high-level overview of the site history. As described in that section, military activity at the former Fort Ord included the use of the site for cavalry, field artillery, and infantry unit training, including maneuvers and live-fire training operations, from 1917 through 1994. Additional details on site use history can be found in Final Track 3 Impact Area Munitions Response Area, Munitions Response Remedial Investigation/Feasibility Study, Former Fort Ord, California (OE-0596R). No changes will be made in response to this comment.

COMMENT 6:

"Page 2, Paragraph 4; Please explain what "RA" is and where specifically the public may find "Track 3 RD/RA WP Update (Kemron, 2018)."

RESPONSE TO COMMENT 6:

The acronym "RA" stands for remedial action. The Track 3 Remedial Design/Remedial Action Work Plan (RD/RA WP) Update can be found in the Fort Ord Document Library with its document number OE-0929B. Please visit https://fortordcleanup.com/documents/search/.

COMMENT 7:

"We note on Page 23 that 1,144.20 lbs. of MD were recovered on this further inspection of Orion and Watkins Gate Roads. This included; 81 mm mortars, 60mm mortars, 37mm projectiles, 75mm projectiles.

The FOCAG has the following question: How many munition burial pits were located here or near here?

It was common practice following Army training maneuvers and/or mortar target practice, to send in the Army bulldozers kept at Fort Ord to dig trenches or pits up to ten feet deep, then scrape the roads and surrounding surfaces, and bury munitions underground. Over time some of these munitions can work their way upward, or the surface elevation will change with wet Winters."

RESPONSE TO COMMENT 7:

Table 3 presents a summary of the Orion Road and Watkins Gate Road subsurface MEC removal. Appendix D, Intrusive Investigation Results, includes the item description for each target. Due to the nature of the subsurface investigation procedures, any munition burial pits within these fuel break limits would have been detected in the course of the work and reported on. No munition burial pits were documented in these locations on Orion Road and Watkins Gate Road.

COMMENT 8:

"Page 31, it states the classification process identified 11,416 anomalies. Of these, there was successful removal of the first 9,873 anomalies. Question: Please remind us again how deep you

went seeking anomalies? Secondly, what was the maximum depth below ground surface that you went seeking anomalies?
The FOCAG notes on page 32 it is reported that mortars and projectiles were found up to 37 inches deep. The FOCAG asks, What about the Burial Pits?"

RESPONSE TO COMMENT 8:

Appendix D, Intrusive Investigation Results, lists the recovery depth of each target investigated. A maximum depth cut-off was not established for this work. As described in Section 2.6.2, each target was investigated until the predicted item (or metallic item on comparable size and shape) was recovered or until the excavation reached 12 inches below the predicted depth of the anomaly source.

COMMENT 9:

"Page 35, Figure 1, is a fold out depicting the Impact Area MRA. Road names are identified. Units are identified by different Unit Numbers.
The FOCAG has a question; This fold out map is a tan color with a legend Blue, Red, and Orange color roads. The question is; Why is Unit 5 different? It is a light beige color, why?
Another question: What is going on with Unit 5? It is close to South Boundary Road, and the former Fort Ord property line."

RESPONSE TO COMMENT 9:

Figure 1 is an aerial photograph of the Impact Area MRA. Unit 5 appears lighter than the other units because at the time of the photograph vegetation cutting had occurred recently in Unit 5 (2021).

COMMENT 10:

"Appendix B, the Geophysical Classification Validation Plan has 6 pages written, then has ten pages that are not legible. What happened here?"

RESPONSE TO COMMENT 10:

The pages are not legible because the table on these pages is too large for the paper. The table can be viewed by accessing the file on fortordcleanup.com and zooming into the table.

COMMENT 11:

"Appendix C has about 20 pages but does not, in this section, define for the reader what the the Classification numbers mean, i.e., 0, 1, 2
FOCAG question; Out of all these ID's one is highlighted in yellow, Flag I.D. 132008. The Grid I.D. is (Orion Road) OR109. Why is this significant? Why is this one highlighted in yellow?"

RESPONSE TO COMMENT 11:

The classification categories are described in Section 2.5.7. The classified targets are evaluated and ranked based on their likelihood of being a target of interest- an object that could be MEC (munitions and explosives of concern). Target OR109_132008_001_11 is the lowest ranked target that resulted in the recovery of a target of interest. As discussed in Section 2.6, to properly verify the library match thresholds and comply with the Department of Defense Advanced Geophysical Classification Accreditation Program requirements, the next 200 targets ranked lower than this target were intrusively investigated.

Appendix D: Responses to Comments

KEMRON ENVIRONMENTAL SERVICES

RESPONSES TO COMMENTS

Document Title:	Draft Fuel Breaks, Impact Area Munitions Response Area, Munitions and Explosives of Concern, Remedial Action Report, Former Fort Ord, California, July 2026
Commenting Organization:	California Department of Toxic Substances Control (DTSC)
Commenter Name:	Brett Leary and Alberto Gutierrez
Date of Comments:	September 22, 2026

Project Manager, Alberto Gutierrez Comments:

COMMENT 1:
Section 6.0 Protectiveness Assessment. "The protectiveness of the RA was evaluated against the requirements of the Track 3 ROD (Army, 2008). The RA performed in the fuel breaks was consistent with the Final SSWP (Shaw, 2010), Orion and Watkins Gate Road SSWP (KEMRON, 2023a), Final RD/RA Work Plan (USACE, 2009), RD/RA WP Update (KEMRON, 2018) and no conditions contrary to these documents were encountered.

The MEC RA for the project area is complete, and all subsurface MEC remediation areas passed QC/QA."

a. The report says that the Remedial Actions were evaluated against the requirements of the Record of Decision (ROD) and were consistent with Site-Specific Work Plan (SSWPs), Work Plans, and Updates and passed Quality Control/ Quality Assurance (QC/QA). DTSC recommends including a summary or explanation for how the remedial actions that had taken place followed, were consistent with, or passed the requirements of each document. This will help the reader have a good understanding as to why the remedy was protective.

RESPONSE TO COMMENT 1:
Section 6.0 has been revised to summarize the QC/QA results that demonstrate the RA was consistent with the governing documents. How the RA met each governing document is described in the RAR as follows: the Track 3 ROD (Army, 2008), the selected remedy, and the remedial action objectives in Section 3.1; the Non-Burn SSWP (Shaw, 2010), the Orion Road and Watkins Gate Road SSWP (KEMRON, 2023a), the approved field work variances, and the quality assurance project plans in Section 1.2; the QC/QA results in Section 4.0; and the actions that will continue under the Track 3 ROD, Final RD/RA Work Plan (USACE, 2009), and RD/RA WP Update (KEMRON, 2018) in Section 6.0. Supporting detail is provided in the Volume 1, Volume 2, and Volume 3 FB TIPs (Appendices A through C).

For clarification, the following revision will be implemented in Section 6.0, Protectiveness Assessment, at the end of the second paragraph:

> "The three phases of the fuel break reestablishment work were conducted within the confines of the approved work plans and subjected to QC and QA inspections

> and approval. Post-ROD remedial actions were based on the Non-Burn SSWP (Shaw, 2010) and *Final Quality Assurance Project Plan, Former Fort Ord, California, Volume II, Appendix A, Munitions and Explosives of Concern* (KEMRON, 2016). All analog QC surveys were passed, and all blind seeds were successfully recovered. All data and field results met the established QA criteria. The 25.5 acres of supplemental subsurface MEC removal in the Impact Area MRA Fuel Breaks is complete. The supplemental subsurface removal was completed based on the Non-Burn SSWP (Shaw, 2010), the Orion Road and Watkins Gate Road SSWP (KEMRON, 2023a), and *Final Quality Assurance Project Plan, Superfund Response Actions, Former Fort Ord, California, Volume II, Munitions Response, Appendix B, Advanced Geophysical Classification for Munitions Response Quality Assurance Project Plan* (KEMRON, 2016a). No targets of interest were recovered from the verification and validation investigations."

COMMENT 2:
Section 6.0 Protectiveness Assessment. "Subsurface MEC removal was not completed in asphalt sections along portions of Austin Road, Hugo Road, and Orion Road. These areas are shown in the appropriate Tabs. Subsurface MEC removal was also not completed in asphalt areas beneath perimeter gates providing access to the Impact Area MRA."

a. DTSC recommends providing a brief explanation as to why the stated areas were not completed, and also provide information as to whether or not these areas are protective.

RESPONSE TO COMMENT 2:
The Non-Burn SSWP (Shaw, 2010) defined the system of permanent fuel breaks on which 45-foot wide subsurface removal would be completed, excluding paved sections (Volume 2 FB TIP Section 1.2; Volume 3 FB TIP Section 1.2), and portions of Austin, Hugo, and Orion Roads were not excavated at the direction of the USACE (Volume 1 FB TIP Section 3.2.3). The asphalt sections are shown in Volume 1 FB TIP Tabs 1, 9, and 13. These areas, and the asphalt areas beneath perimeter gates, are addressed by the LUC component of the selected remedy, which includes a requirement for construction support for ground-disturbing activities (Section 3.1).

For clarification, the following revisions will be implemented in Section 6.0, Protectiveness Assessment, in the fourth paragraph. The following sentence will be added after the sentence "These areas are shown in the appropriate Tabs.":

> "Portions of Austin, Hugo and Orion Roads were not excavated at the direction of the USACE."

The following sentence will be added at the end of the paragraph:

> "The Non-Burn SSWP (Shaw, 2010) defined the system of permanent fuel breaks on which 45-foot wide subsurface removal would be completed (excluding paved sections) as part of the remedial action."

In addition, consistent with the Response to EPA General Comment 1, the following sentences will be added to the first paragraph of the Executive Summary, following the sentence that ends "within the fuel break system were resolved":

> "Subsurface MEC removal was not completed in asphalt sections along portions of Austin Road, Hugo Road, and Orion Road. Subsurface MEC removal was also not completed in asphalt areas beneath perimeter gates providing access to the Impact Area MRA. The selected remedy includes a requirement for construction support for ground-disturbing activities."

COMMENT 3:
Section 6.0 Protectiveness Assessment. General Comment. DTSC recommends adding a summary or chart that illustrates remedy protectiveness across the fuel break locations. Clearly presenting how investigation methods, removal depths, and detection coverage support the protectiveness determination will help identify where additional, reduced, or no further remedial action may be warranted and will strengthen the RAR's technical basis.

RESPONSE TO COMMENT 3:
Table 4, Fuel Break Remedial Action Summary, has been added. For each fuel break segment, Table 4 lists the years of MEC remediation, the detection methods, the supplemental subsurface MEC removal grids and acreage and the MEC recovered during that work, the total MEC removed, and the areas where subsurface MEC removal was not completed. The removal depth criteria are clarified in Sections 2.6 and 3.2.3, as described in the Response to EPA General Comment 2.

The following sentence will be added at the end of the fourth paragraph of Section 6.0, Protectiveness Assessment:

> "Table 4 summarizes the remedial action within each fuel break segment, including the areas where subsurface MEC removal was not completed."

Unexploded Ordinance (UXO) Engineering and Special Projects Office (ESPO) Brett Leary, P.E. Comments:

COMMENT 1:
The Fuel Breaks Impact MRA and MEC, RAR consolidates MEC removal quantities/types and chronology from Technical Information Paper (TIP) Volumes 1–3 with appropriate Figures; however, the consolidation would be stronger with additional explanation of how the historical investigation methods, removal depths, and detection coverage support the protectiveness conclusion. The TIP volumes contain the necessary detail, but the RAR does not yet bring that reasoning forward in a way that clearly ties the history of work to the final determination that all hazards have been resolved. Based on our earlier discussion, I encourage you to request an expanded narrative for these areas, so the RAR fully reflects the technical basis for protectiveness and provides a complete, defensible record of the remedial action.

RESPONSE TO COMMENT 1:

As noted in responses to the comments above, the RAR has been revised to bring forward from the FB TIP volumes the basis for the protectiveness determination. The removal depth criteria are clarified in Sections 2.6 and 3.2.3; QC/QA and verification results have been added to Section 6.0; the areas where subsurface MEC removal was not completed are reiterated in the Executive Summary and Section 6.0; and Table 4 summarizes the detection methods, supplemental subsurface MEC removal, and MEC removed for each fuel break segment.

Document Title:	Draft Fuel Breaks, Impact Area Munitions Response Area, Munitions and Explosives of Concern, Remedial Action Report, Former Fort Ord, California, July 2026
Commenting Organization:	United States Environmental Protection Agency Region IX
Commenter Name:	Maeve Clancy
Date of Comments:	September 30, 2026

GENERAL COMMENT 1:
The Draft RAR Executive Summary states that "all previously identified explosive hazards within the fuel break system were resolved," but does not acknowledge that subsurface Munitions and Explosives of Concern (MEC) removal was not completed in portions of Austin Road, Hugo Road, and Orion Road, as well as beneath perimeter gates. Although the statement regarding previously identified explosive hazards may be accurate, the areas where subsurface MEC removal was not completed represent a limitation of the completed removal activities that should be reflected in the summary of the work. Please revise the Draft RAR Executive Summary to acknowledge the areas where subsurface MEC removal was not completed.

RESPONSE TO GENERAL COMMENT 1:
As noted in the comment, all previously identified explosive hazards within the fuel break system have been resolved. The areas where subsurface MEC removal was not completed are the asphalt sections along portions of Austin Road, Hugo Road, and Orion Road, which are described in Section 3.2.3. Detail is provided in Volume 1 FB TIP Tabs 1, 9, and 13, as well as the asphalt areas beneath perimeter gates providing access to the Impact Area MRA (Volume 1 FB TIP Section 11.0). The selected remedy includes a requirement for construction support for ground-disturbing activities. Please also see Response to DTSC Project Manager Comment 2.

For clarification, the following text will be added to the first paragraph of the Executive Summary":

> "Subsurface MEC removal was not completed in asphalt sections along portions of Austin Road, Hugo Road, and Orion Road. Subsurface MEC removal was also not completed in asphalt areas beneath perimeter gates providing access to the Impact Area MRA. The selected remedy includes a requirement for construction support for ground-disturbing activities."

GENERAL COMMENT 2:
The Draft RAR does not consistently define or reconcile the subsurface removal depth criteria applied across the remedial action. The depth descriptors used include "depth of detection," found in Section 1.1, Purpose and Scope; "prescribed removal depths," found in Section 3.2.3, Summary of Remedial Action Methods, without indicating what those depths are; and a 4-foot removal depth for earlier work along central roads and adjacent corridors, referenced in Section 2.6, Summary of MEC-Related Activities Prior to Remedial Action. None of these sections state what each depth

represents or how the three relate to one another. This same ambiguity was previously identified by EPA Region 9 in its August 18, 2020 comments on the Volume 1 Technical Information Paper (TIP), General Comment 1 and Specific Comment 3, which noted that describing some removal actions as conducted to a depth of 4 feet and others to depth of detection could be read to indicate that MEC may remain below 4 feet in areas where that depth was used as a removal criterion. In response, USACE committed to revising the Volume 1 TIP to state that no subsurface anomaly investigation was left unresolved at a 4-foot depth, and to clarify the relationship between the two removal criteria. That clarification was not carried forward into the Draft RAR, which reintroduces the same unreconciled depth terminology, without restating the prior clarification or its supporting basis. Please revise the Draft RAR to clearly define and reconcile the applicable removal depth criteria, depth of detection, prescribed removal depths, and the 4-foot depth described for earlier work, consistent with the clarification previously provided in response to EPA's 2020 comments on the Volume 1 TIP.

RESPONSE TO GENERAL COMMENT 2:
The clarification provided in the responses to EPA's August 18, 2020 comments on the Volume 1 FB TIP (General Comment 1 and Specific Comment 3), which are included in Appendix D of the Volume 1 FB TIP (Appendix A of this RAR), had been incorporated into the draft-final version of Volume 1 FB TIP. This information has been carried forward into Sections 2.6 and 3.2.3 of the RAR. The depth of detection (Section 1.1) is the subsurface removal criterion for the RA. The 4-foot depth referenced in Section 2.6 describes the earlier work as it was termed at the time, and as detailed in the responses to the 2020 EPA comment, all detected anomalies were investigated and resolved. The phrase "prescribed removal depths" in Section 3.2.3 has been replaced with "the depth of detection."

For clarification, the following revisions will be implemented. In Section 2.6, Summary of MEC-Related Activities Prior to Remedial Action, the following text will be added after the sentence that ends "along central roads and adjacent corridors":

> "During Phases 1 and 2, all detected anomalies were excavated and removed. During Phase 3, detected anomalies were excavated until encountering the source or reaching the specified depth of 4 feet. If a team reached that depth without finding the anomaly source, the team consulted with a USACE representative about whether to proceed with further excavation. Records indicated that subsurface investigations stopped at a depth of 4 feet in one grid, Riso Ridge E096 (current grid ID RI096). This grid was later included in a soil remediation excavation under the Site 39 soil remediation program. After the soil excavation, subsurface removal to a depth of 4 feet was conducted in the excavation area, and all detected anomalies were intrusively investigated or resolved."

In Section 3.2.3, Summary of Remedial Action Methods, the first sentence of the second paragraph will be revised, and text will be added after it, to read:

> "Subsurface removal activities were completed across fuel break segments to the depth of detection to support the Track 3 remedy. The Non-Burn SSWP (Shaw, 2010) provided the following process for subsurface investigation: "All subsurface

> removals will be to the depth of detection of each particular instrument, with the caveat that any anomaly investigation below four feet in depth will be approved by the USACE OE Safety Specialist and USACE PM [Project Manager] prior to investigation. All anomaly investigations that are not resolved after reaching 4 feet in depth will be referred to the USACE OE Safety Specialist and USACE PM." The depth provision for consultation with USACE is an element of task and cost control for the cost-reimbursement contract. It is not meant to allow incomplete investigation of subsurface anomalies when subsurface removal to the depth of detection is intended. Based on the MMRP database, no detected anomaly was left unresolved after reaching a 4-ft depth in excavation."

GENERAL COMMENT 3:
The Draft RAR figures, titles and associated information are not consistently aligned with the List of Figures. For example, Figure 3 has different titles in the List of Figures and on the figure itself; Figure 6 is identified as the Southeast Impact Area MRA in the List of Figures but as the Northeast Impact Area MRA on the figure, although the figure appears to depict the Southeast area; and Figures 9 through 11 contain inconsistencies between the List of Figures and figure titles regarding MEC versus munitions debris (MD) and, for Figure 10, the Northeast versus Southeast Impact Area MRA. The legends for Figures 9 through 11 also identify "Fuel Break Grid with MD Weight," which appears inconsistent with the corresponding figure titles identifying MEC recovered. Please review and reconcile the List of Figures, figure titles, figure content, and legends for Figures 3, 6, and 9 through 11.

RESPONSE TO GENERAL COMMENT 3:
The List of Figures, the titles on the figures, and the figure content were reviewed and reconciled. Figure 6 and Figure 10 depict the Southeast Impact Area MRA, as shown by the location inset on each figure, and Figures 8 through 11 depict munitions debris (MD) weight per grid, as shown by the figure legends and as stated in the Executive Summary. The legends are correct and have not been revised. The titles on Figures 6, 9, 10, and 11 have been corrected to match the figure content and the List of Figures. The List of Figures entries for Figures 2 and 3 have been revised to match the titles shown on those figures.

GENERAL COMMENT 4:
The title for Table 3 is not consistent among the List of Tables, the table divider page, and the table itself. The List of Tables and divider page identify Table 3 as "Fuel Break MEC Summary," while the table itself is titled "Comprehensive MEC by Segment for the Fuel Break System." Please reconcile the Table 3 title throughout the Draft RAR.

RESPONSE TO GENERAL COMMENT 4:
Table 3 is titled "Comprehensive MEC by Segment for the Fuel Break System" on the table itself. The List of Tables and the reference to Table 3 in the last paragraph of the Executive Summary have been revised to match the title shown on the table. The Table 3 divider page has been removed.

SPECIFIC COMMENT 1:

Definitions, Impact Area, Page vi: The definitions section defines Impact Area only as the specific 8,000-acre area at the former Fort Ord, rather than defining the term as it is generally used within the Military Munitions Response Program (MMRP). Other entries in the same section, such as Discarded Military Munitions (DMM) provide the general definition of the term before noting any site-specific application, but the Impact Area entry omits the general definition entirely. Please revise the Impact Area definition to first describe the term as it is generally used within the MMRP, followed by the existing site-specific description of the Impact Area at the former Fort Ord.

RESPONSE TO SPECIFIC COMMENT 1:
For clarification, the definition of Impact Area in the Definitions section will be revised to read:

> "Impact Area: The historical impact area consists of approximately 8,000 acres in the southwestern portion of former Fort Ord, bordered by Eucalyptus Road to the north, Barloy Canyon Road to the east, South Boundary Road to the south, and General Jim Moore Boulevard to the west. Source: (1). The ground and associated airspace within the training complex used to contain fired, placed, dropped, thrown, or launched AE [ammunition and explosives] and the resulting fragments, debris, and components from various weapon systems. Indirect-fire weapon system impact areas include PE [probable error] for range and deflection. Direct-fire weapon system impact areas encompass the total SDZ [surface danger zone] from the firing point or position down range to Distance X. It also includes Area B [buffer zone] when required. Source: (8)"

The following source will be added to the Sources of the Above Definitions:

> "(8) Army Regulation 385-63 Range Safety. May 23, 2025(Army, 2025)."

SPECIFIC COMMENT 2:
Definitions, Mortar, page viii: The definition of Mortar states that mortars typically range from approximately 1 inch to 11 inches in diameter; however, no fielded mortar exists at a 1-inch caliber. The smallest known mortars are approximately 50 millimeters (mm), roughly 2 inches, such as the Japanese Type 98 50 mm mortar, and the recovered MEC inventory in Table 2, MEC Items Located and Removed by Fuel Break Grid, appears to list no mortar item smaller than 60 mm, approximately 2.36 inches, anywhere across the fuel break system. Although the definition is drawn from a cited source, the source itself is a general overview publication rather than a technical ordnance reference, and its imprecision should not be carried into the Draft RAR. Please revise the Draft RAR definition to read "approximately 2 inches to 11 inches in diameter".

RESPONSE TO SPECIFIC COMMENT 2:
This comment is acknowledged. While the source of the definition is a general overview publication, the definition is retained rather than creating a Fort Ord-specific definition.

SPECIFIC COMMENT 3:
Executive Summary, Page xii, and Sections 3.2.3.8 through 3.2.3.17, Pages 12 through 15: The Executive Summary states that 42 MEC items were recovered during supplemental subsurface MEC removal on the seven listed roads, while the quantities reported in the individual road

sections total 38 MEC items (Hawkeye Road: 1; Impossible Canyon: 0; Mercury Road: 13; Nowhere Road: 0; Orion Road: 8; Riso Ridge Road: 12; and Watkins Gate Road: 4). The basis for the additional four MEC items included in the Executive Summary total is not clear from the individual road sections. Please reconcile the 42 MEC items reported in the Draft RAR Executive Summary with the quantities reported for the individual roads.

RESPONSE TO SPECIFIC COMMENT 3:
The 42 MEC items reported in the Executive Summary are correct and are consistent with Table 2. Sections 3.2.3.12 and 3.2.3.13 understated the supplemental results: one UXO item was recovered on Nowhere Road during analog investigation of a data gap (Volume 2 FB TIP Section 3.3.2), and 11 UXO items, not eight, were recovered on Orion Road (Volume 2 FB TIP Section 3.3; Volume 3 FB TIP Table 7). The 13 items recovered on Mercury Road consist of 12 UXO items and one discarded military munition (DMM). With these corrections, the supplemental results by road are: Hawkeye Road, 1; Impossible Canyon Road, 0; Mercury Road, 13; Nowhere Road, 1; Orion Road, 11; Riso Ridge Road, 12; and Watkins Gate Road, 4; for a total of 42 MEC items.

For clarification, the following revisions will be implemented:

> Section 3.2.3.11, Mercury Road: "…during which 13 MEC items (12 UXO and one DMM) were recovered and are included in the total of 233 MEC items reported above."
>
> Section 3.2.3.12, Nowhere Road: "One UXO item was recovered during this supplemental effort and is included in the total MEC count reported above."
>
> Section 3.2.3.13, Orion Road: "…during which 11 UXO items were recovered and included in the total MEC count reported above."

SPECIFIC COMMENT 4:
Section 3.2.3.8, Hawkeye Road, Page 12: The text initially identifies 85 MEC items as recovered but subsequently states that 86 MEC items were recovered. Table 2, Total MEC Quantity, and Table 3, Comprehensive MEC by Segment for the Fuel Break System, both identify the total as 85 MEC items. Unlike the other supplemental-removal roads, which state that supplemental recoveries are included in the total already reported without restating a new figure, this narrative introduces a second, different total. Please reconcile the reported MEC quantity for Hawkeye Road.

RESPONSE TO SPECIFIC COMMENT 4:
The total for Hawkeye Road is 85 MEC items, as shown in Table 2 and Table 3. The one UXO item recovered during the supplemental subsurface MEC removal on Hawkeye Road is included in the 85 MEC items. The reference to 86 MEC items was a typographical error.

For clarification, the following revision will be implemented in Section 3.2.3.8, Hawkeye Road:

> "One UXO item recovered during this supplemental work is included in the 85 MEC items reported above."

SPECIFIC COMMENT 5:
Section 3.2.3.11, Mercury Road, Page 13: The text initially identifies 233 MEC items as recovered but subsequently states that 246 MEC items were recovered. Table 2, Total MEC Quantity, and Table 3, Comprehensive MEC by Segment for the Fuel Break System, both identify the total as 233 MEC items. Unlike the other supplemental-removal roads, which state that supplemental recoveries are included in the total already reported without restating a new figure, this narrative introduces a second, different total. Please reconcile the reported MEC quantity for Mercury Road.

RESPONSE TO SPECIFIC COMMENT 5:
The total for Mercury Road is 233 MEC items, as shown in Table 2 and Table 3. The 13 MEC items recovered during the supplemental subsurface MEC removal on Mercury Road are included in the 233 MEC items. The reference to 246 MEC items was a typographical error. As described in the Response to Specific Comment 3, the 13 supplemental items consist of 12 UXO items and one DMM item.

For clarification, the following revision will be implemented in Section 3.2.3.11, Mercury Road:

> "Twenty-one grids (2.40 acres) were included in the supplemental subsurface MEC removal as described in Volume 2 FB TIP (KEMRON, 2021a), during which 13 MEC items (12 UXO and one DMM) were recovered and are included in the total of 233 MEC items reported above."

MINOR COMMENT 1:
Acronyms and Abbreviations, Page iv: There are typographical errors in the Acronyms and Abbreviations list, including the misspellings of "Institutional Control" and "Ordnance". Please correct these typographical errors.

RESPONSE TO MINOR COMMENT 1:
The typographical errors have been corrected. For clarification, the Acronyms and Abbreviations list will read "IC – Institutional Control" and "UXO – Unexploded Ordnance."

MINOR COMMENT 2:
Definitions, Military Munitions, page vii: The Military Munitions definition is not separated by a paragraph break from the preceding Material Potentially Presenting an Explosive Hazard (MPPED) definition, unlike every other entry in the Definitions section. Please add a paragraph break so Military Munitions appears as its own stand-alone definition, consistent with the formatting used throughout the rest of the section.

RESPONSE TO MINOR COMMENT 2:
The paragraph spacing before the Military Munitions definition has been corrected so that Military Munitions appears as its own stand-alone definition, consistent with the formatting used throughout the Definitions section.

RESPONSES TO COMMENTS

Document Title:	Draft Fuel Breaks, Impact Area Munitions Response Area, Munitions and Explosives of Concern, Remedial Action Report, Former Fort Ord, California, July 2026
Commenting Organization:	Fort Ord Community Advisory Group
Commenter Name:	Mike Weaver
Date of Comments:	September 5, 2026

COMMENT 1:
The FOCAG is alarmed at the BRAC conclusions in this Draft Document. There is an air of certainty that is not in keeping with the history of former Fort Ord, the lack of records left behind when it closed, nor the burial pits of ammunitions and toxic chemicals left behind that were not mapped. Of course the ground can and does move over time.

Examples of troubling language found in this document (numbered 1-6 by FOCAG)

1) The Executive Summary States: "1997- 2023…all previously identified explosive hazards within the fuel break system were resolved"

2) The MEC remedial action (subsurface removal) for the fuel breaks within the Impact Area MRA is complete.

3) These actions fulfill the requirement for subsurface MEC removal to be conducted in the regularly maintained fuel breaks and access roads within the Impact Area Munitions Response Area (MRA), as described in the Final Track 3 Record of Decision, Impact Area Munitions Response Area, Track 3 Munitions Response Site, Former Fort Ord, California [Track 3 ROD] (Army, 2008)

4) This Remedial Action Report (RAR) documents the completion of munitions and explosives of concern (MEC) removal within the permanent fuel break system of the Impact Area Munitions Response Area (MRA) at former Fort Ord, California (Figure 1)

5) 2.2 Reuse
The Impact Area MRA is designated for transfer to the BLM for use as a habitat reserve in accordance with the HMP (USACE, 1997), which establishes land-use restrictions and habitat management requirements to protect special-status plant and animal species. Anticipated reuse activities within the habitat reserve include:
• Road and trail management and maintenance
• Habitat enhancement, including prescribed burning
• Fuel break management
• Administrative area use
• Habitat monitoring and educational programs

• Species-specific monitoring and habitat enhancement
• Recreational access on established routes

6) The MEC RA for the project area is complete, and all subsurface MEC remediation areas passed QC/QA (Quality Assurance and Quality Control)

RESPONSE TO COMMENT 1:
As discussed in Section 1.1 of the document, the purpose of this Remedial Action Report is to document the scope, execution, and results of the subsurface munitions removal conducted within the permanent fuel breaks of the Impact Area Munitions Response Area. The "project area" for this document constitutes the approximately 32 miles of linear fuel breaks covering approximately 184 acres within the Impact Area Munitions Response Area. Quality control/quality assurance activities conducted for the removal action are also described in the document. The Executive Summary has been revised to acknowledge the areas where subsurface MEC removal was not completed.

COMMENT 2:
The FOCAG has the following questions and concerns;
This document seems to be about more than just the fuel breaks, now used as roads and trails for both BLM and for recreation.

The FOCAG does not know the staffing numbers of BLM employees currently stationed at former Fort Ord.

The FOCAG does not know the annual numbers of hikers, joggers, bicycles, electric bikes, that recreate on former Fort Ord, including on the fuel breaks.

The FOCAG does not have a current estimate of the types, number of animal, bird, and plant species, and the number of each species estimated to be on former Fort Ord.

The FOCAG does know that remaining unexploded ordnance, in addition to the soil and water chemical contamination issues are still huge. We need the Army BRAC and we need the Federal and State Regulatory Agency's ongoing oversight of these important safety and health related issues.

RESPONSE TO COMMENT 2:
Comment acknowledged. The RAR documents completion of the MEC remedial action within the fuel breaks within the Impact Area Munitions Response Area and the associated quality control/quality assurance activities. Other remedial activities required by the Track 3 ROD continue to be implemented in the Impact Area Munitions Response Area. For example, the site remains fenced and access remains restricted. The additional questions and concerns regarding ongoing land use, recreational activities, ecological resources, remaining unexploded ordnance, chemical contamination, and continued Army BRAC and regulatory agency oversight are noted. These topics extend beyond the specific remedial action within the fuel break-portion of the Impact Area Munitions Response Area documented in this RAR.
