

Sites 2 and 12

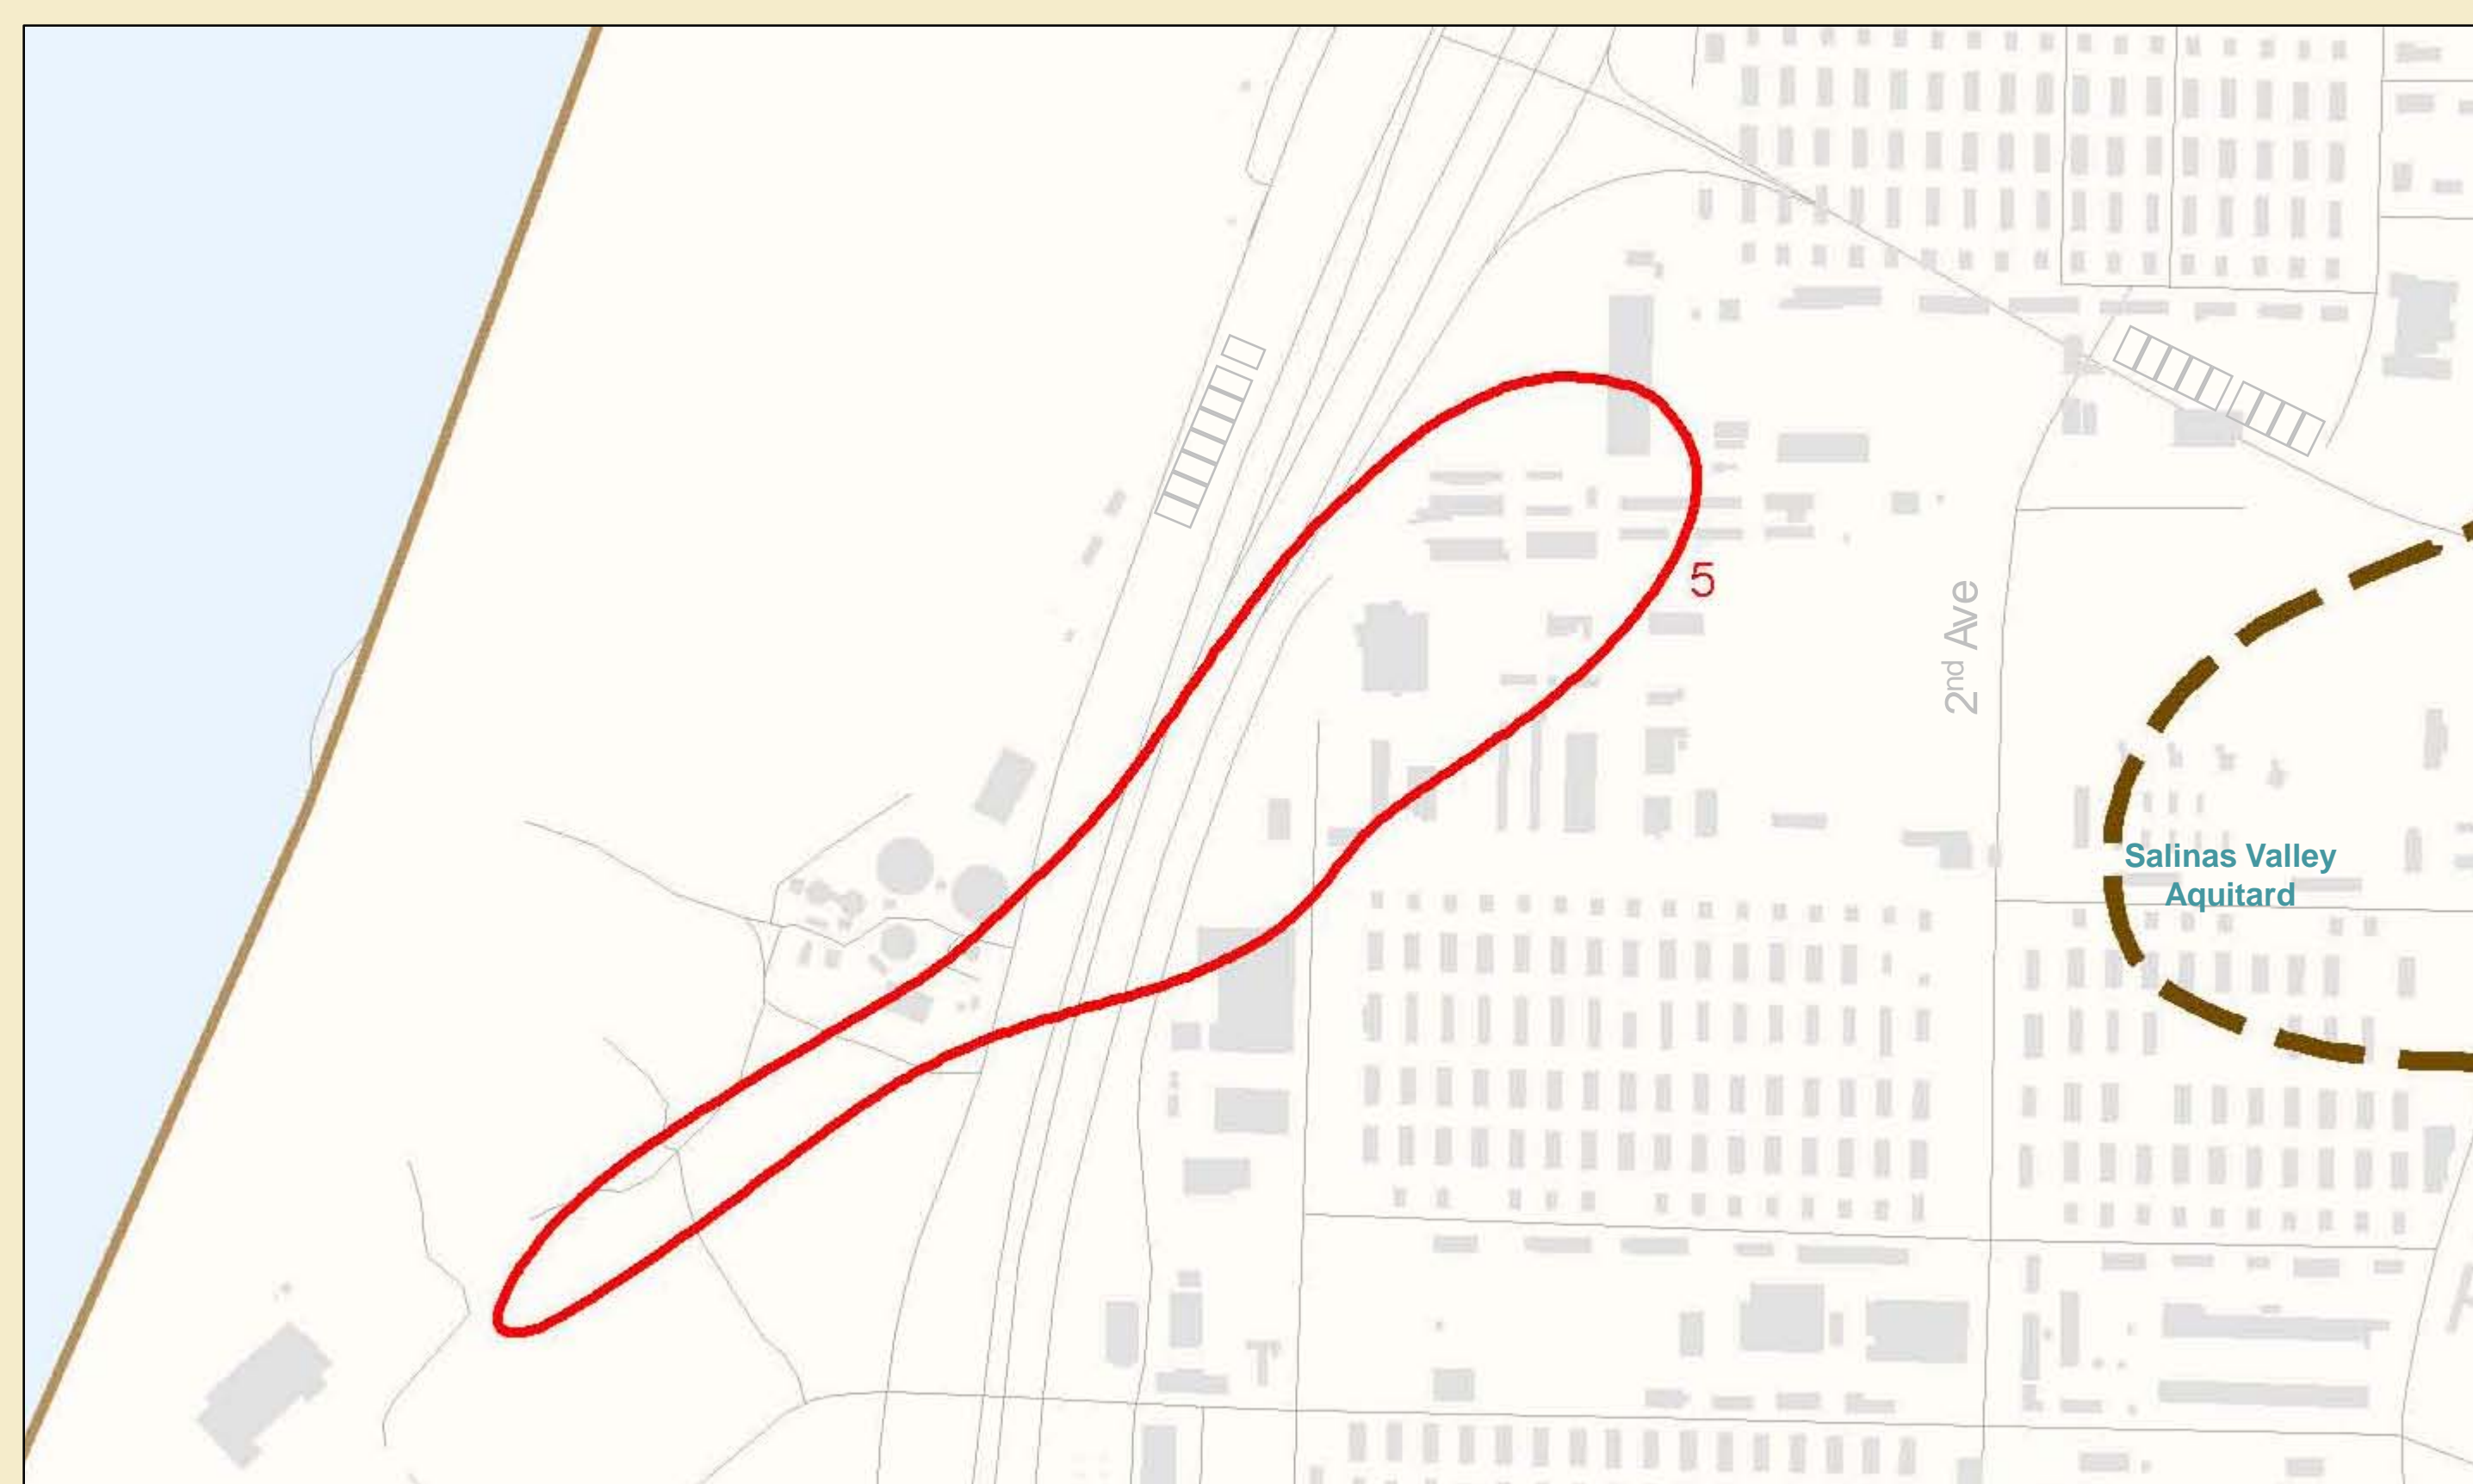

Groundwater Cleanup

- Discharges from a former truck and auto maintenance facility in the Site 12 area (in the current location of “The Dunes on Monterey Bay” shopping center) caused soil and groundwater contamination.
- Excavation to remove contaminated soil was completed in the 1990s.
- Trichloroethene (TCE) and tetrachloroethene (PCE) are the main contaminants found in groundwater.
- Treatment system was constructed in 1999. Over 1.7 billion gallons have been treated and 460 lbs of contaminants removed as of December 31, 2013.
- The Army’s cleanup operations have effectively reduced contaminant concentrations in groundwater.

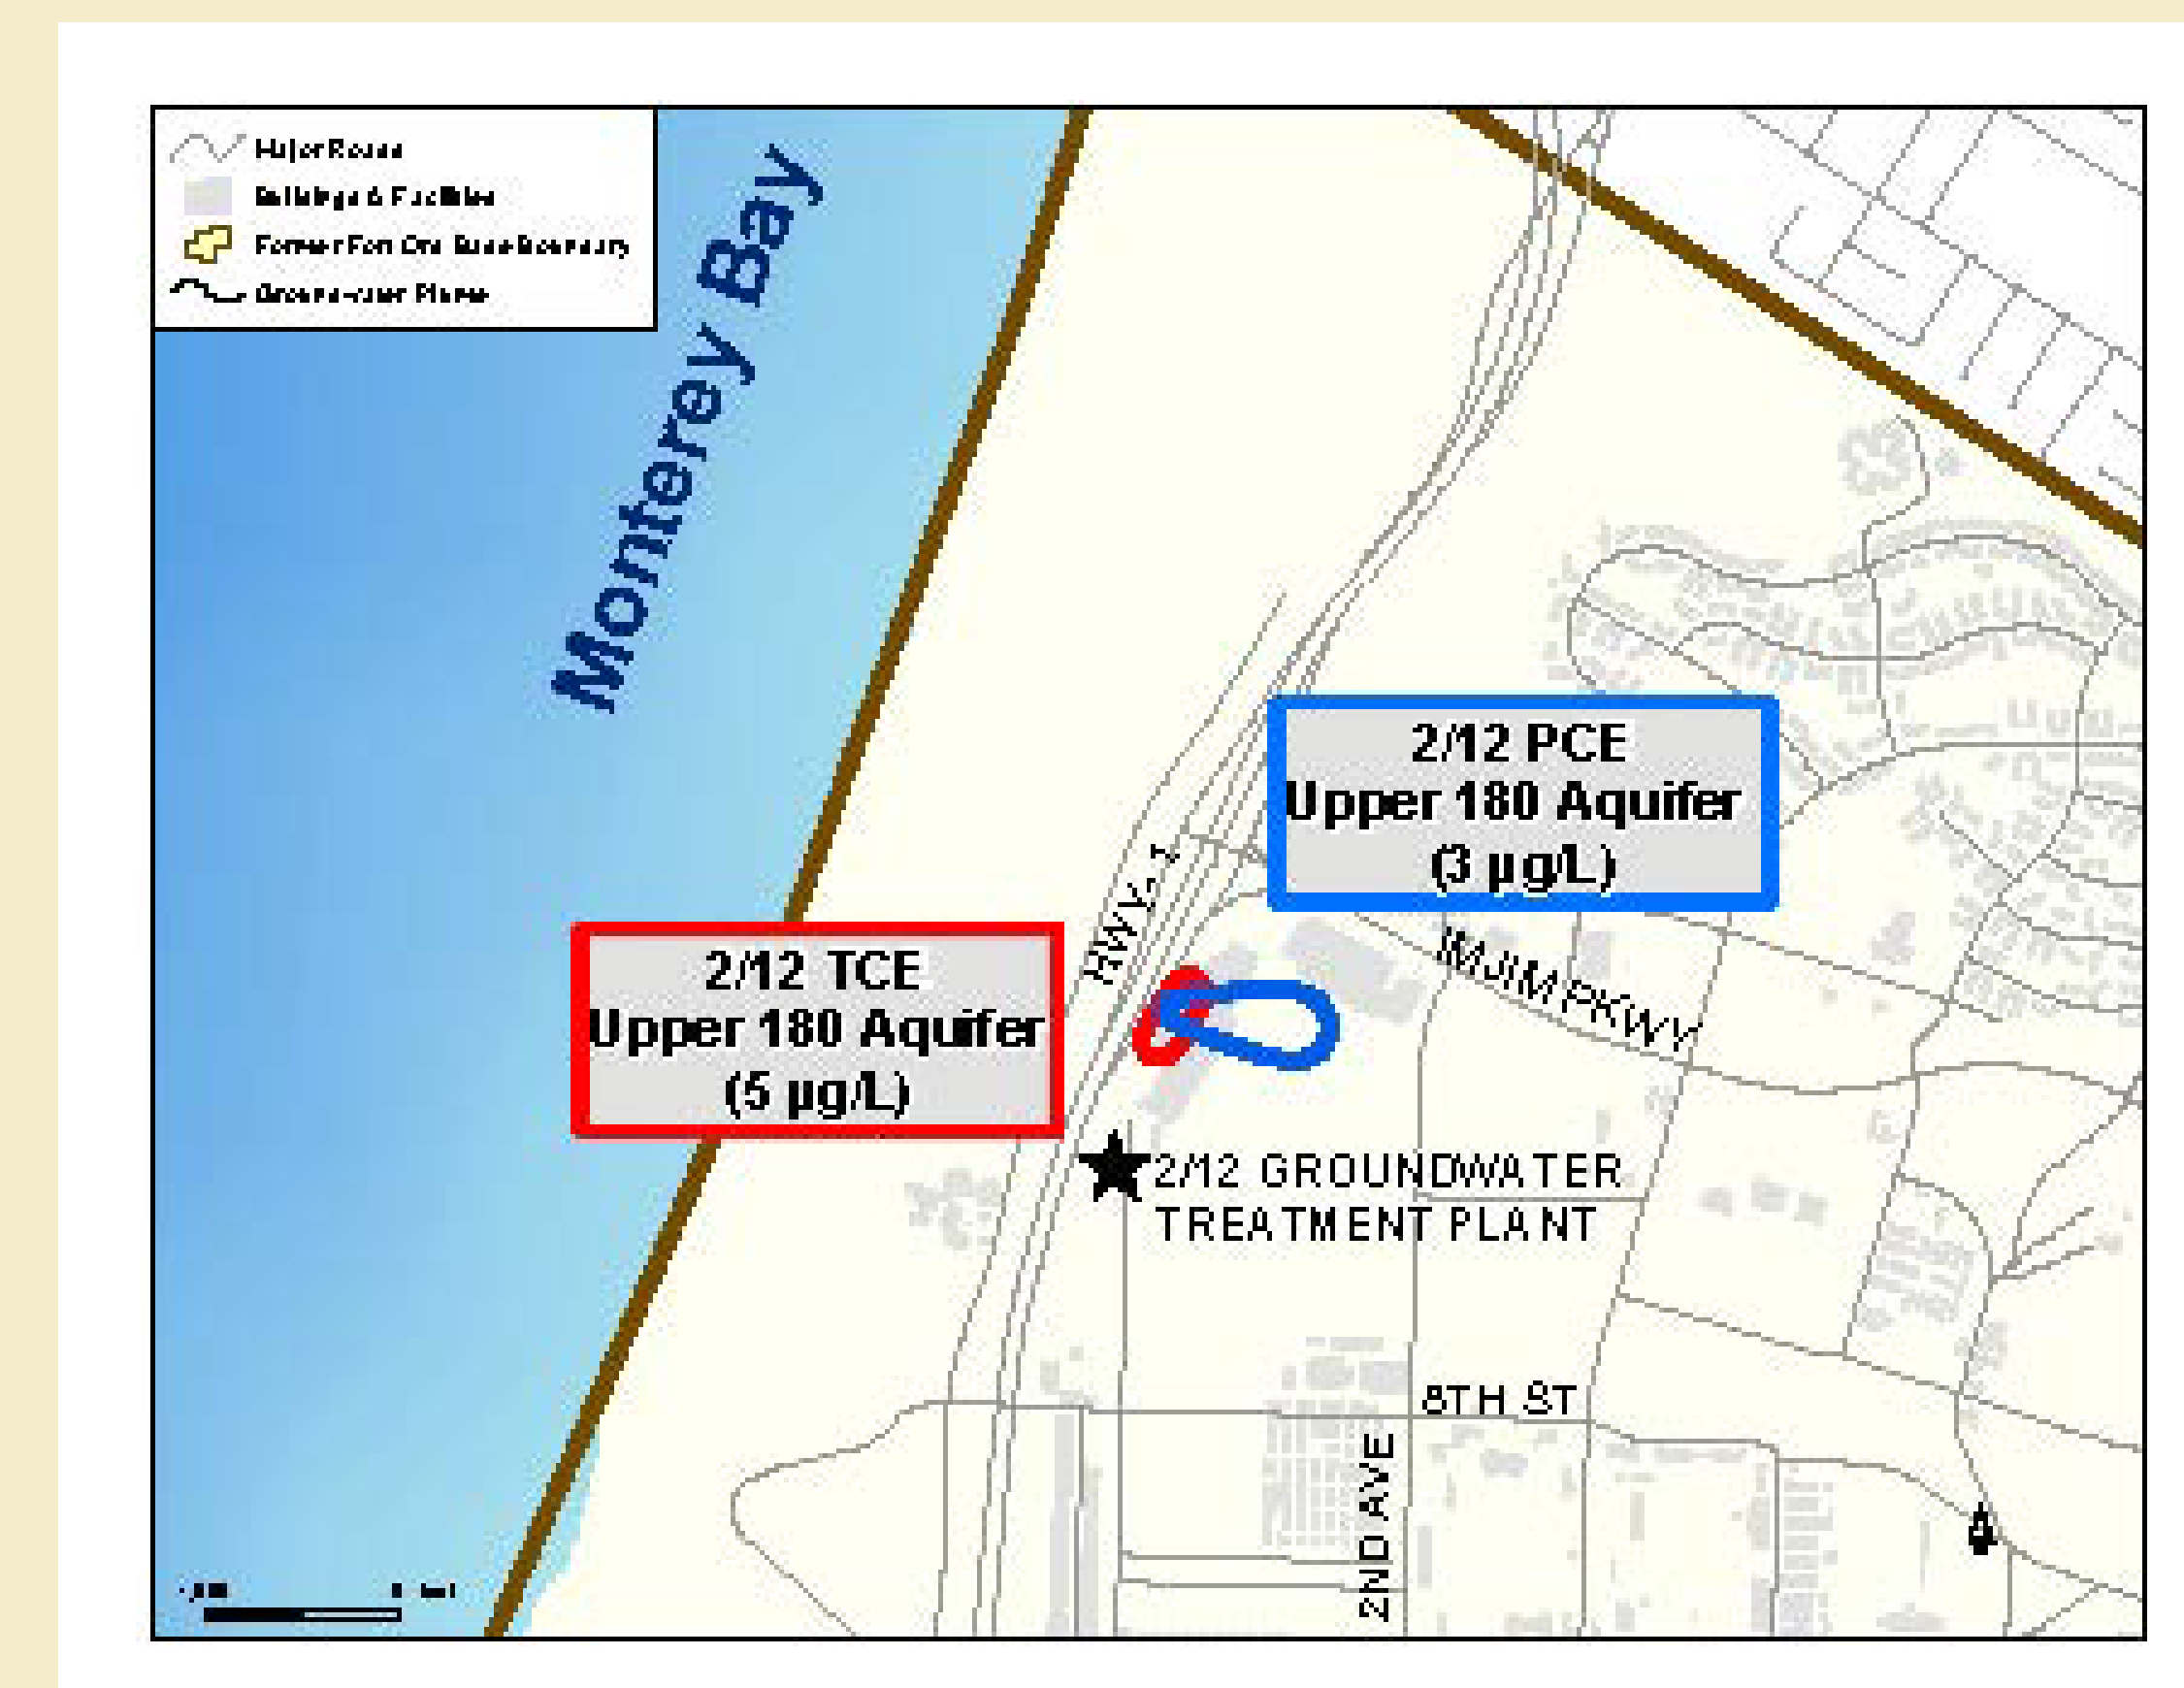

Groundwater Treatment System
